Sir,—When I undertook, at your request, to prepare a paper on steam cultivation, I did not think of the criticisms I might subject myself to, but I hope it may not be considered presumption on my part, as I do not do so with a feeling or wish to dictate, or to try to lay down a law of my own to so many men of far greater experience than myself; but as you had more than once asked me to relate my experience in regard to steam cultivation, and I did not feel competent then to do so, because I had not tried it sufficiently long to arrive at any fair conclusion as to its benefits, I have now assented. Besides we, the tenants of the Lombe estate, are here together with our future landlord at the head of us, and I say that on such an occasion we should open our minds to each other. I believe if farmers were more ready to interchange ideas, it would be more beneficial to them as a community, and to this country at large. We have not hitherto combined as other classes of trades and professions have done. Farmers, as a rule, do not enter altogether into a new scheme or system; each awaits the result of his neighbour's venture. This certainly has been the case in my immediate neighbourhood. In my opinion, agriculture is passing through a crisis in its history. Farmers as a body cannot do much without the countenance of their landlords, and perhaps we Norfolk agriculturists have been in rather a drowsy condition since the days of Coke, of Holkham. He was a most enlightened and generous man, and one who took great pride and interest in agricultural matters; and through him and his exertions there is little doubt that Norfolk farmers gained their celebrity, and for some years afterwards they strove to maintain their reputation as first-class agriculturists. The present noble lord has inherited his father's love of agricultural pursuits, and has generously offered a handsome sum of £200 for the best essay on the improvements effected in farming in the Eastern counties during the last twenty years. This may give a fresh impetus in awakening our minds, and stirring us up to make exertions to keep up with the times, and place ourselves again in the foremost ranks. I have no doubt his lordship thought we were but too content with our laurels of the past, in fact too much inclined "to rest and be thankful," and therefore he offers this magnificent sum in order to give us a chance of comparing notes with our neighbours, and to open the eyes of us stay-at-home farmers to the fact that others are progressing fast, and if we do not keep a sharp outlook they will send us to the bottom of the class, and properly place themselves at the top. Handsome as is the amount Lord Leicester offers, and which we must all acknowledge, and heartily thank him for, I must say I think the Norfolk Agricultural Society and the various societies of the selected counties ought to have shown their appreciation of his gift by supplementing it with a grant of a further sum, rather than to have done what practically amounts to the opposite, and by claiming the copyright of the essay to prevent its being worth any man's while to gather the necessary facts. For in order that a man may write on a subject, he must have knowledge of that subject, and I do not see that in this case it can be gained in any other way than by visiting the different counties, and, gentlemen, travelling expenses are heavy—"so I have heard." I, for one, most anxiously look forward to the appearance of the award and the essays. I fear there will not be many candidates in the field, as it must neces-

sarily be a very expensive affair to prosecute the inquiry fairly. I have no doubt that the modes of cultivating land will be one of the foremost subjects treated on in such essays. Here the advance has been most marked. You will all agree that the double-furrow plough has already done something towards economising farm labour by saving the work of horses as well as men, and that which has already been accomplished in this way is but a prelude to the farther improvements culminating in the substitution of the great power of steam in place of the less effective horse-power and manual labour. The cultivation of land by steam power is approved, allowed, and practised by the leading agriculturists of our day; therefore, I think those who have had no practical experience ought to watch carefully its results, and pause awhile before they unhesitatingly condemn it. I have by me letters containing the opinion of various friends to whom I have written on this subject, one from Mr. J. K. Fowler, who, you will remember, was a judge at our recent show at Norwich, which I will read. Another, from a friend of mine now present, and whose opinion you all esteem, viz., Mr. Wigg. After speaking highly of it, he says he has no doubt, although the hiring system is very expensive, it will pay in the end. His barley looks remarkably well, and in his case without men this year it has been invaluable to him. Mr. John Hastings writes me to the same effect. Gentlemen, I dare say you remember my saying last year at this time I feared we should have to encounter great difficulties in regard to manual labour. I now say again I can see difficulties looming in the future: our labourers will most likely ask us for more money. It is but human nature for every one to do the best he can for himself. What other power have we to fly to but steam? It is not many years since our crops were thrashed by the old wood flail; that system is now entirely exploded. Such is being the case with the wood plough. After the flail came the horse-power thrashing machine. That has now made way for the steam-engine. Many of us here present doubtless have heard our fathers condemn the use of steam-power for thrashing as being both dangerous and expensive; but who among us here would like to go back to the old system, and hang half-a-dozen horses on to a horse-power thrashing machine to thrash fifty or sixty coombs of corn per day, when we can now thrash by steam as much as 100 or 120 coombs? Why, in these days it is not practicable; and so in a few years will the steam plough occupy the place of the horse. Since I began to use the steam plough I have had many difficulties to contend with. As in most trial cases, many people have doubtless been anxiously watching results, and without knowing all details or taking into consideration that which so materially affects all farming operations—viz., good or bad seasons—have been ready to condemn if there has been failure; but ought we to live for ourselves alone? May not a man, even if unsuccessful himself, be considered to have effected some good in his generation if he has paved the way for others to profit by his experience? Before giving you my experience, which at present is somewhat limited, I wish to offer you my opinions on steam cultivation, confining myself for the most part to light, mixed soil and sharp land. I thoroughly believe, and have no hesitation in saying that this kind of land can be and is cultivated deeply by steam power as advantageously as heavy land. In the first place, to bring all its producing powers into operation, the hard pan that lies beneath the working of the common plough must be broken. This cer-

tainly is the great object of breaking up the land to a greater depth. We thus allow the water to pass freely through the surface and filter itself, leaving its valuable properties behind in the surface soil; otherwise it is unable to find its way downwards, but remains long enough to become stagnant, poisoning the soil, and of course injuring the seed or plant to a serious extent. To illustrate this, I have no doubt many here present have heard old labouring men talk of dry rot and wet rot, or something of that sort, and declare the latter to be the most injurious to the young turnip plant. Why, gentlemen, any amount of rain that we get in England will not hurt our young turnip plants, provided it can pass quickly away so as to leave the ammonia it contains for the youngster. Also there are many weeks in the summer we neither expect nor get enough moisture from the clouds for our barley and roots; but if this can be broken there is moisture beneath, and the rootlets of the plant will cause it to ascend as freely as it descended, and so give nourishment to our annuals and help them on to maturity. It is not clear to my mind which is the most beneficial season to smash up land, autumn or spring. Of course our corn stubbles and the land intended for a root crop is the right land to begin on, because by the time it is wanted for the wheat crop it becomes in a sufficiently consolidated state. Many people prefer doing it in the autumn. It may be right on heavy soils, especially if the farmer has tackle of his own so that he could run the cultivator through again in the spring, which would enable him to obtain the enviable fine seed-bed. But at the same time, if he is depeuding and working on the liring system, the chances are he cannot then get the tackle to do it with; consequently the land has become in a too consolidated state; he is unable then to get a fine seed-bed, and the land can not produce so fine a crop as it otherwise would have done. I am inclined to believe that on our mixed soil and sharp land the early spring is the best time of year to cultivate for a good root crop, provided it can be done early enough to ventilate the soil, and to allow injurious gases which may be contained in the land to escape, which, if remaining, would be injurious to vegetation. As far as my experience goes, if one has not a set of tackle of his own, it is better to plough the land with horses after harvest, and that not too soon, but let what weeds there are to grow at that time of the year get well up before ploughing, then take the first opportunity in the spring and smash up the land. You have then completed and generally obtained a good and fine seed bed, with plenty of soil for the roots of the plant to work in. The chief object in smashing the land up in the autumn is, that it may have the benefit of the frosts to pulverise it, and to obtain the seed bed; but on mixed or light land this course of proceeding or system is not necessary, and if a wet winter follow, the land becomes bound, and hardened again, which we like to avoid for roots; the weeds also, such as twitch, senesion, and natural grass flourish on the top, and give an untidy appearance to autumn cultivation. One cannot help this sort of thing, because it is impossible to put horses on the land to destroy weeds, and even, if possible, it would be injudicious. This was unfortunately the case in the autumn of 1872, considered to be one of the most disastrous seasons we had to contend against, both as regards horse and steam cultivation, since that great benefactor, "Smith, of Woolston," put his ideas into operation seventeen years ago, a man who has conferred lasting benefit, not only to the agriculturists of this country, but I may say to the whole community, for he has spent a great part of his life, energy, and skill, in utilising this wonderful power for the culture of the soil. There are many reasons why steam cultivation is not at present more extensively practised. One is the supposed costliness of the method, which I admit has been increased by the late great rise in the price of coal and labour; but as my friend Mr. Fowler says, "we must not be deterred from our great work by the addition of a few pence per day to our labourers' wages, nor by a few shillings per day to the price of our coal." By and by I will tell you what it has cost me per acre (as nearly as I can calculate). You can then judge for yourselves whether or no it is more expensive than horse culture. At the same time you must take into consideration that you will be able to work your farms with a less number of horses. In the tedious process of farming, with our small profits and slow returns, we do not, comparatively speaking spend £1,000 to-day and get £1,500 by the speculation to-morrow. No, we must be patient and bide our time. So also with steam cultivation. If I leave

farm at Michaelmas, I am not so foolish as to expect to get

all the £ s. d. I have spent in the ploughing by steam during the last few years, but it will eventually pay. In such a case my successor would reap the benefit of my exertions. Therefore I think if tenant-farmers undertake this kind of work, a lease would in many cases be desirable, for he ought not to be too much restricted as to cropping, provided of course that he farms well, and is not too greedy and unreasonable. I have been in the habit of using Fowler's double-engine tackle, simply because I could hire no other. The work is very effectually done by this system, but I consider it in general too cumbersome for the small ill-shaped fields of East Norfolk. There are many good makers of roundabout tackle, among whom I would mention, Messrs. Howard, of Bedford; Barford and Perkins, of Peterborough; Fowler, and Fiske, of Leeds, any of whose sets are suitable for our farms in this part of the world, and can be worked by a ten or even an eight-horse portable engine. They will, if placed in the corner of one field, either plough, cultivate, or harrow those adjoining. I dare say many people, like myself, have a portable engine of their own, and I feel sure if I had purchased a set when I commenced steam culture, I should have been a good sum of money into pocket. Taking into consideration the present price of horses, I am bound to think any person now about to take a farm would do well to buy one. The work could then be done more effectually, and I do not hesitate to say larger crops would be grown. But great care should be taken not to bring the dead soil to the top. In the spring of 1872 I dug up 42 acres of turnip land 15 inches deep for barley, at a cost of 20s. per acre for men, engines, and tackle, and 6s. per acre for coal. Part of the land was taited by sheep, the rest had a dressing of Laws' barley manure, at a cost of 25s. 6d. per acre. Of this land I thrashed nine coombs of barley per acre, against six coombs per acre four years previously, and now the wheat on it this dry season looks as promising as I have ever seen it. That spring I smashed up 28 acres of wheat stubble at the same cost per acre; this land, with a dressing of Laws' turnip manure, at a cost of 35s. per acre, produced as good a crop of roots as I ever expect to grow. I also cultivated 30 acres, 16 inches deep, which cost 12s. per acre for tackle, &c., and 4s. an acre for coals. On nine acres of this land I am growing white peas this year, and though I have been across England in two or three directions since the beginning of May, I must say it is one of the best fields of peas I have seen. My clover crop is not by any means a good one this year, for which I can give good reason—viz., having thrown some fences down, the course is altered in some of the fields, and those having clover this season were cropped with clover two years ago. Consequently it was clovertick and died off in the early spring. Also in the year 1872, having done away with a fence, and wanting to bring a field into proper course with its neighbours, which was wheat, I dug up a wheat stubble 15 inches deep, and gave it a dressing of Laws' barley manure, at a cost of 34s. per acre. This land returned me about ten coombs per acre of barley. There is now barley after turnips in that field, and it is by far the best I have. In the autumn of 1872, I cultivated all my wheat stubbles after harvest at a cost of 12s. per acre for engine and tackle, and about 7s. per acre for coals, with the exception of one field, which was dug the same depth. The very wet season, however, bound the land together again. The weeds flourished most luxuriantly on the top, and gave the land such an untidy appearance, that it quite (for the time) disgusted me with autumn steam tillage; so I hired the tackle again in the spring, and did it a second time. This land was carefully watched by people far and near, so I was told, and I hear some one said I was mad, and should never get a crop. However, to my satisfaction, and perhaps much to their surprise (one field of 30 acres in particular, 12 acres of which had grown a corn crop two years in succession), with a dressing of Finch's turnip manure, produced the finest crop of swedes that I had ever grown. The field which was dug in the autumn did not require cultivating in the spring, but produced a good crop of white turnips. In the autumn of the same year (1872) I was rather behind with my work, so I thought I would try an experiment, therefore I ploughed 30 acres of old land 9 inches deep for wheat, which cost me 20s. per acre, and at least 10s. per acre for coals. The additional expense was caused partly by stoppages during wet weather. It was at this time I was practically impressed with the fact that the single engine or round-about system was the cheapest, as there is, of course, only one fire to feed, which is no small object

when coals are dear, as they were at that time. With the double-engine system only one engine can work at a time, but steam must be kept up equally in the other in order that it may be in readiness to pull the plough back. Many people came to me while this work was being done, and told me I should get no wheat. Naturally enough I inquired why? The invariable reply was, "You should not plough deep for wheat." On again asking why, I could get them to give me no reason sufficiently satisfactory to stop me from proceeding with my work. One person alone encouraged me, and he was a shrewd Manchester merchant. Before I give you the result, it is only fair to tell you how this land was treated. There were two fields—one of nine acres, a clover ley mown for hay, which was afterwards fed with sheep eating cake, and then had a dressing of about fourteen loads of farm-yard manure per acre. This field produced $9\frac{1}{2}$ coombs of wheat per acre. The other 21-acre field was also a good clover ley on which I put twelve loads of manure per acre in February, 1873. I took off it a good crop of hay, and as soon as the clover sprang up again about 200 shearlings, which were each eating half a lb. of bruised cake per day, laid on it at night. At Michaelmas I put on about eleven loads of farmyard manure per acre, and ploughed it nine inches deep. The result was a fine-looking piece of wheat, yielding ten coombs per acre, and as clean a stubble as could well be. This spring I smashed up this twenty-one acres to the depth of fifteen inches, it cost me £1 6s. 6d. per acre, including coals; on one part is mangold, looking thrifty and well, with sixteen loads of farmyard manure, and 3 cwt. of Hallet's manure per acre underneath them. There are also five acres of Tartar oats, with nothing under them, but I top-dressed them in April with 6 st. of salt and 1 st. of nitrate of soda per acre. I ought to say I had two reasons for planting the oats: one was, of course, for my own benefit and use, the other an experiment for this paper. All I can say of them at present is that they are looking well, but, to use a vulgar simile, the proof of the pudding will be in the eating. The rest of my fallows were ploughed by horses in November, and smashed up by steam in the spring; they received a dressing of 4 cwt. of Hallet's manure per acre, and the seed put in about the 13th of May. There they are mostly chopped out, singled, and some hoed a second time. They speak not in words, but in appearance for themselves and steam cultivation. I will conclude by giving you the esti-

mated quantity of work that can be done on mix soil land per day, also coals used:

1st. Digging ten inches deep the engines will consume three-quarters of a ton of coal each per day, and will do about eight acres.

2nd. Digging twelve inches deep, seven acres per day, consuming one ton of coal each.

3rd. Digging sixteen inches deep, five acres per day, consuming one ton of coal each.

Cultivating about fifteen or sixteen inches deep, three-quarters of a ton of coal each engine, doing from sixteen to eighteen acres per day.

All my calculations are made exclusive of one man and two horses for carting coals and water. Now one or two words for myself. I have endeavoured to give you my opinions and experience as plainly as possible. If I have failed to do so, you must attribute it to my inability, and I must ask you to excuse me. I can truly say I have not aimed a blow at any one, but at the same time I felt bound to deal openly and honestly with the subject. I have also condensed the subject as much as I possibly could. After all I do not know that the actual paper itself does much good, or is of much benefit, even if written by the most experienced of writers. But I consider that the discussion which naturally follows ventilates the subject (if I may use such expression) and draws the attention of persons who may not have given it much consideration before. You all remember the sensible wish expressed by our most esteemed and worthy Chairman, at our last audit—viz., that these meetings should become more profitable. Such a wish, emanating from such a quarter, can but receive our respectful attention as far as it lies in our power to oblige him. I agree with him, that we, the tenants on this large and important estate, ought not to come here merely to enjoy the hospitality shown to us, and make merry over our wine and cigars, but also to interchange ideas, make known our opinions and experience for the benefit of each other. I trust Mr. Lombe will call on another of his tenants to read a paper on some important subject in practical farming. Gentlemen, I have done my best, and I think you heartily for the indulgence with which you have listened to my crude remarks. I have endeavoured only to set down plain facts. And if the paper has sounded somewhat egotistical, you must bear in mind that it was my own experience I was asked to relate.

A S E W A G E F A M I N E .

Colonel Jones has given a very encouraging return of all which he has so far been able to do on the Hafod or Wrexham sewage farm. Nevertheless, the gallant gentleman has not been in a position to do the system justice; for, strange as it may sound, there is just at present, in certain districts where its employment prevails, a kind of sewage famine. The more common complaint once was that, whether you required it or not, when once you had agreed to take the sewage down it still came on you, roaring and pouring, just as the waters do at Lodore. Colonel Jones' complaint is all the other way, as in a pamphlet which he has recently published, and from which we give an extract in another place, he says: "I am thoroughly convinced that so far from obtaining the amount of nitrogen and phosphates due to the population—9,000—offered by advertisement, I cannot have received more than one-third of that amount; and soon after my arrival I discovered that the Corporation of Wrexham daily and nightly cart away from the town and sell, periodically by auction, a large quantity of refuse which should properly come down its sewers to my land." The very natural consequence is that the Local Board may get into hot water, or in other words have to answer an indictment as to its sanitary regulations.

Recently, we were invited to join a party which paid a visit to Mr. Hope's farm at Britton's, upon which the sewage of Romford is expended, the more especial

object of the visit being to show the working of a sewage farm to a few French gentlemen who are engaged on a similar means of cultivation in the vicinity of Paris. But as with Colonel Jones at Wrexham so it is with Mr. Hope at Romford; and as an illustration of how sewage may be best expended upon the land, the example was certainly not so happy nor so telling as that which we remember was offered at Britton's just four years since. At that period and after less than a year's occupation of a poor unlikely place Mr. Hope was making experiments over a variety of crops, all of which promised to succeed. There were great growths of peas, selling, with the straw left, at £15 per acre, while none of the neighbouring farmers had in that season been able to grow any peas; there were carrots making £41 per acre, or £20 an acre profit; cabbage of all kinds flourishing exceedingly, some sorts reaching to a marvellous size; beetroot estimated at £80 an acre, patches of Indian corn, and so forth. In fact, the Paris deputation should have come over to Britton's in 1870 instead of in 1874. Of course, we still heard, rather than saw, much of the continual cuttings of rye-grass; there was a healthy plant of red mangel—good only in patches—which has yet to grow up to its weight, and some really fine level bits of spring wheat, straight in the straw and full in the ear. But this, more particularly after our previous visit, was scarcely that realization of a system which we had expected

to see, and Mr. Hope himself readily admitted as much. How was it the mangel only prospered here and there? Simply because it was only here and there that it had been properly fed with sewage; the local authorities of Romford have broken faith with Mr. Hope, just as the Wrexham people have with Colonel Jones, and as the sewage which it is entitled to does not flow on to Britton's farm another system of cultivation has necessarily been adopted, more in accordance with the common principles of cultivation, where men grow large breadths of wheats and roots. Indeed, what with Mr. Hope's difficulties and protests, backed by the lamentations of Messrs. Chadwick and Rawlinson over the ignorance of the people, the several speeches at the luncheon were met with a chorus rather of wails than cheers; and Paris offered more as an example to Britton's than Britton's to Paris.

And there was also at the luncheon in that queer old title barn, where a Cherry Shorthorn bull supported the chairman, a gentleman learned in the law, who, as he duly announced, has himself for a client. Mr. Preston, a solicitor at Brentwood, is an apt pupil of Mr. Hope, and has so entered on agreement to take all the sewage of that town, for use on the farm which he holds. But, like Colonel Jones and Mr. Hope, Mr. Preston finds that he cannot get all the sewage, although, as he said, he had "taken care to have a legal remedy," and as a lawyer should get his law at wholesale prices, it is possible that the sewage of Brentwood may carry a perfume into the new Courts, if these are only ready in time for the reception of Mr. Preston's agreement. The sewage of Romford is said to be only half as "good" as that of London, but it bears a most abominable odour, as it could be run breast high in the three miles drive from the town to the farm; and the still quick eye of Mr. Mechi was able to discover a brandy flask in the side-pocket of a visitor, who "had been here before to-day."

Mr. Hope gave a history of the long war which he waged with Parliament, and his vain struggles against the Fabian policy of Commons' Committees; and Mr. Rawlinson announced that owing to the discharge of the sewage into the Thames the Metropolitan Board of Works would probably be indicted for committing a nuisance. Beyond this, neither Mr. Rawlinson nor his patron, as it seems, Mr. Chadwick had anything very encouraging to say; but they took their cue from the tone of the meeting, and directed their abuse rather at Corporations and civic authorities than against their favourite target, the sloth and ignorance of the farmer. The present aspect of the sewage question is certainly not altogether an inviting one, unless it be to a man who has a fancy for getting out of cold water into hot; or in other words, for fighting a public body, and, as Mr. Preston says, "taking himself for a client."

TWO YEARS AT A SEWAGE FARM.

Having for many years availed myself of every opportunity of visiting and inquiring into the different sewage farms in England, chance threw in my way an advertisement offering a farm of 84 acres with the town sewage of 9,000 population to be had by tender for a term of years from February 2, 1872; and upon inspection of the farm in question it seemed to present a fair opportunity for one of the practical trials which will, I trust, eventually convince the public that sewage farming can be made a success financially as well as in a sanitary point of view. I accordingly entered upon possession of the farm of Hafod-y-wern in February, 1872, and suffered from a perfect deluge of rain for the first year, no encouraging contingency to be faced by one who would have had the power of watering his crops while his neighbour's fields were parched with drought, but could not by aside the watering pot when the natural fall of water was at least double the amount any

farmer could have wished to receive from the heavens. The second year just closed has not been so dry as a sewage farmer might have desired, but still it has not been so constantly wet as its predecessor, and I am thankful to say that a profit has been gained (as will appear from the annexed accounts) which will more than recoup the loss upon the first year, in which, besides the wet weather, the farm lay under the additional disadvantages of being understocked and leaving to grow fifty-four acres of meadow lay more or less of which in such a season must inevitably have been damaged. I may perhaps be charged by some persons with coming forward precipitately with my two year's practical experience, but I am so impressed with a conviction that much human misery, disease, and death in and near our large towns may be prevented by sewage farming on a gigantic scale when a sufficient number of practical men can be induced to take up the subject in earnest, that I feel it a duty by every means in my power to endeavour to excite an interest in the matter, and if possible induce others to educate themselves in the management of the sewage of small towns like Wrexham, as a preparatory step towards dealing with the larger ones, whose wants may be more pressing, but demand a body of experience which is not yet forthcoming to provide against mistakes on a large scale which throw discredit upon sewage farming by unremunerative works, and thus retard the general advance of the cause of truth in regard to sewage treatment. Moreover I think that more confidence will be felt in statements of accounts published from the first from year to year, than if they were withheld for simultaneous production at a future period, and I desire to act upon the following expression of opinion by Mr. H. J. Morgan, the careful manager of the Lodge Farm, Barking, in his published account of its cultivation from August 31, 1871, to December 31, 1872, viz.: "I would here again express my regret that none of those interested in sewage farms have thought fit to publish their experience in a detailed and business-like form. At present this farm belonging to the Metropolis Sewage Company is the only instance in which results obtained by the application of sewage have been consistently reported during the last six years. Our successes and our failures have been alike recorded under the conviction that anything less than the *wholesale* truth in the matter would be worse than useless in the interests of the Company and of the general public." The town of Wrexham, celebrated, like Burton and Romford, for its beer, is bisected by a brook fordable at every point in dry weather, but bearing a large volume of water after rainfall on the neighbouring mountains, and is thus well situated for drainage to the main sewer, which follows the course of the brook to some tanks at the nearest part of Hafod-y-wern Farm to the town, from which it is only separated by two small fields. Six acres of the farm lie on a bank above the tanks, inaccessible to the liquid sewage, but conveniently situated for a trial of the sludge which is scooped out by hand from time to time, and left to dry on the banks of the tanks, and thus deducting these six acres with two more (for roads, garden, &c., included in the nominal eighty-four) a balance of seventy-six acres appeared available for sewage irrigation if the land was levelled and prepared for the purpose. The farm had been taken by the Local Board two years before I was acquainted with it, and although some steps had been taken to level part of the land, it had suffered sadly from neglect and mismanagement during those two years, which caused considerable loss to the ratepayers, and made the Board anxious to get rid of their charge. I found two-thirds of the land in permanent pasture, which had been treated as water-meadows with excessively large carriers supplied with brick and wood penstocks for retaining considerable volumes of water; and the simple plan followed by the Local Board had been to fill these carriers with sewage, and allow it to ferment in a manner calculated to cause an intolerable nuisance to persons frequenting a public footpath which traverses the whole extent of the farm. When the sewage was not on these meadows, the exhalations from the thick coating of black sludge deposited in the wide and deep carriers must have been even more offensive in hot weather than when they were full of liquid sewage, and their appearance was at all times truly disgusting. I was assured on all hands that the land was saturated with sewage, and that a larger extent was required for irrigation, that the grass produced had been rank and unfit for cattle, and that the Local Board had made a large annual loss by their farming. The bad quality of some hay in stack and abundance of docks and nettles, &c., in the meadows gave colour

to these reports, but I could account for all by theories of my own, and after mature consideration agreed upon certain conditions to relieve the Board of the unexpired term of their lease, *i.e.*, eighteen years from February, 1872. It was impossible at the time to get any trustworthy analysis or to gauge the average flow of sewage, and wanting the experience which now leads me to treat all the reports of excess of sewage as delusions, they certainly made me anxious, and led me to stipulate for more land if the sewage should be strengthened above a certain percentage on its existing number of house connections; but certain fixed outlets for overflow from the sewer gave me the assurance that I could never be burdened beyond a certain point in respect of volume of sewage, and with a population advertised as 9,000 I never dreamt of failing to receive enough nitrogen for my seventy-six acres, or of being deluged with brook and rain-water in dilution of the sewage pure and simple which I had bargained for; so I believed the hearsay evidence to a certain extent, and determined at once to provide myself with a safety valve in the shape of two acres of filter beds on the Met-yr Tydvil plan. Mr. Bailey Denton most kindly furnished me with full particulars at Merthyr, and by the beginning of May I was able to turn the whole sewage and water coming from Wrexham upon two acres prepared as filter beds, using them in alternate periods of twelve hours each for eight consecutive days and nights without injury to a crop of cabbages planted on ridges, and with every clear stream of effluent water running from the deep drains. But since that time I have found the "safety valve" altogether unnecessary, because the actual flow of sewage is so very inferior in strength to what I had been led to expect, and because by the growth of Italian rye-grass and experience of the requirements of my land I have long felt independent of the protection of a safety valve such as I had proposed to myself in constructing my filter beds. If, as at first supposed, I had too much sewage and too little land, the filter beds would have been invaluable, as the principle of intermittent filtration is undoubtedly sound. Without going further into details, I may here say that I am thoroughly convinced that so far from obtaining the amount of nitrogen, phosphates, &c., due to the population (9,000) offered by advertisement, I cannot have received more than one-third of that amount; and soon after my arrival I discovered that the Corporation of Wrexham daily and nightly cart away from the town and sell, periodically, by auction a large quantity of town refuse, which should properly come down its sewers to my land. This abstraction of valuable matter is not all I have to complain of however, and in order to explain my position, I would adduce the following letter addressed to the Town Clerk in June, 1872, the only reply to which was a verbal one to the effect that the Council could not at present face the expense necessary to remove the evil complained of in my letter:

Hafod-y-wern Farm, Wrexham, June 4, 1872.

Sir,—I regret extremely that I am compelled to make a report for the information of the Sanitary Committee of the Local Board on a subject which may involve trouble and ultimate expense to the ratepayers of this borough, but silence after my experience of the late rainy season might be held as consent to defective sewerage arrangements over which I have no control, and my management of the Hafod-y-wern Farm might be censured on account of pollution of the town brook by sewage which has never reached the tanks on the outfall lands for which I am responsible if I did not put the following statement upon record. The Farm Committee may remember my inquiry in February last regarding the outlets from the sewer to the brook (one at the Weir and another in the tank enclosure) and that I was informed that sewage seldom overflowed by those channels. The late wet season may have been peculiar, but I can only say that experience has shown me that such overflow is of frequent occurrence and sufficient in amount to cause very considerable nuisance to persons living near the brook or making use of its water. To take the case to-day as the result of some heavy rain last night, I found on visiting the tanks at 8 a.m. that both overflows were running in a strong stream of most offensive sewage while the brook itself was not much fuller than usual, and as the tank into which the sewer flows was emptied on Saturday last and the sewage was passing through it at not less than the rate of 20,000 gallons an hour, it is manifest that no obstruction under my control was the cause of the pollution I noticed entering the brook. At noon, at 4 and at 6 p.m. the

overflow in the tank enclosure was still running and had hardly ceased at 7 p.m., eleven hours after I first observed it, and the course of sewage to the land was all the while flowing at about the above rate—*viz.*, 20,000 gallons an hour. I understand that arrangements are now being made to add the sewage of High Town to the main sewer, and this is an additional reason for my pressing the subject upon the Board, because the overflow I complain of may thereby be made more frequent or perhaps even constant. It is not my province to suggest a remedy, but the "separate system" by which the storm water from roofs and streets could be conducted *directly* to the natural watercourses instead of indirectly after pollution in the sewer is so obviously the right one that I may perhaps be allowed to allude to it.—I have, &c.,

(Signed)

ALFRED S. JONES.

To the Town Clerk, Wrexham.

On October 3, 1872, I again addressed the Town Clerk on the subject of overflows in still stronger terms as in the following extract from my letter.

Extract from a letter dated Hafod-y-wern Farm, October 3, 1872, from Lieut.-Colonel Jones, addressed to the Town Clerk, Wrexham: "Referring now to my letter of June 4, 1872, to your address which reported for the information of the Sanitary Committee of the Local Board the result of my experience regarding overflows from the sewer, which differed most materially from the state of the case as represented to me by the Farm Committee when I first had the honour of an interview with that body before taking the farm, I have to state that further experience only tends to confirm the statements of that letter, and that the operation of the Public Health Act, 1872, will probably cause the rural sanitary authority to move against the Local Board for removal of the nuisance I then pointed out." This second appeal brought no better results than the first, but during the early part of the year 1873 the borough surveyor, a gentleman of great ability and intelligence, informed me that he had discovered certain leaks in a twelve-inch connection passing along the bed of the brook from a brewery to the main sewer by which brook water gained admittance to the latter whenever the level of the stream was as high as the connection, and on inspection it proved that many of the collars or flanges of the earthenware 12-inch pipe which formed the connection in question had been broken apparently by stones rolling down the brook in floods or thrown by mischievous boys, and the openings thus afforded to brook water fully accounted for the frequent action of the overflows noticed in the above letters. The rainfall of the previous year had accounted to my mind for a great deal of the evil, but as there were intervals of dry weather during which the overflow did not cease, I had attributed some of it to percolation of subsoil water into the sewers, and was consequently glad to find that the intake of water in dry weather could be so easily stopped by the Town Council or brewer repairing the connection; but although a neighbouring landed proprietor, who had reason to complain of the foul state of the brook due to the overflow, has addressed the Town Clerk on the subject as I have repeatedly done myself, nothing, beyond talk in the Council chamber reported in the newspapers, appears to have been done to remedy that portion of the evil, which could be provided for so easily, and which affects the purity of the brook in a much greater degree than the storm water because the overflow due to the latter cause is swept away and to some extent concealed by a larger body of water in the brook itself. In order to make the matter as plain as possible let us take three periods as follows, *viz.*: 1st. During a dry season the whole contents of the sewers are delivered upon the land of this farm, and the brook leaves the farm as little defiled as it entered it. 2nd. In a less dry season when the brook level is high enough to reach the leaks communicating with the main sewer, and yet contains but a small volume of water, then part of it enters the sewer, and meeting the ordinary flow of sewage in the town, forms a body of foul water greater than the capacity of the sewer mouth, and thus overflows near the tanks, causing the remaining course of the brook through my farm and below it to flow in a very foul condition. 3rd. In a wet season the rush of water from streets and roofs of houses over the acreage covered by the town joins the sewage by street gullies, and, with the brook water admitted through the leaks above referred to, results in a greater overflow, but in this last case the body of water flowing down the brook from neighbouring mountains hides, and to a certain extent neutralises

the sewage mixed with it in its rapid course. One great lesson to be derived from my two years' practical study of the sewage question, which has, I trust, been fairly stated in the above remarks, appears to me to be one of general interest to all towns, and I take it as pointing unmistakably to the necessity of adopting in all cases what is called the "separate system," recommended some years ago by Mr. Menzies, Deputy-Ranger of Windsor Forest, &c., adopted at the Camp at Aldershot and promised by the War Department to be carried out as regards

the new Depot Centre Barracks about to be erected at Wrexham, which will set an example to be copied, I trust, ere long by the municipal authorities for the whole town. The "separate system" consists in simply providing a clear course for all rain-water from roofs, streets, &c., by direct lines above or below ground to the natural water-courses, instead of leading it by streets gullies into the sewers, and burdening the latter with the double duty of carrying away both sewage and rainfall. —From Colonel JONES' pamphlet, *Will a Sewage Farm Pay?*

SALE OF MR. MEADOWS' SHORTHORNS,

AT THORNVILLE, WEXFORD, ON FRIDAY, AUGUST 14.

BY MR. THORNTON.

For some time past Mr. Meadows' health has been so indifferent that he resolved to dispose of the bulk of his herd during the week of the Royal Agricultural Society's meeting at Wexford. The herd is kept on his demesne at Thornville, about five miles from the town. Reserving three cows, bountiful milkers, and the calves of this year, the remaining portion of the herd, consisting of nineteen cows and heifers and one bull, were brought to a little paddock hard by the show-yard, and there disposed of by Mr. Thornton on Friday afternoon, the 14th inst. The hour fixed was that arranged for the bank jumping, so that the local attendance was small. The cattle were thin, and, being removed from their own homes, looked even more empty. About eight of the lots were exhibited on the show-ground; permission not being granted for their removal they were sold unseen. Tom Quin, the well-known Irish herd who brought out so successfully Mr. Meadows' Bolivar and Charlie to compete at English shows, seemed very much at sea when the objects of his care were disposed of away from the ring. The beautiful white calf Fanny 35th was put up at 20 guineas, and sold at that price without further bids. Prices were asked for some of the others, but none being made, they were passed as unsold. Lot 21, Mr. Gumbleton's prize heifer, Princess of Wales, went to Canada, at 54 gs.; and Mr. Crisp bought Ruth 25th (which was also exhibited) for 67 gs.

The great object of competition was lot 1, Bracelet 2nd, a fine old cow of large scale, and a good milker, descended from the Killerby tribe of that name; she had bred Ben Biacc, shown last year and this also, and successfully too at the Royal and Yorkshire show; and her last calf, St. Ronan, was exhibited at Wexford. After sharp competition between Mr. Downing and Mr. Cruickshank, the latter secured her at 290 gs.; she will be mated with the celebrated bull, Knight of Kuowhere, who has also been recently purchased by Mr. Cruickshank. Lot 6 and 7, of Mr. Torr's G tribes, were the other desirable lots: they were a little flat, and then Golden Pin being in use at the time of sale after service in April, told against the prices. Mr. Downing bought both at 80 gs. and 62 gs. The descendants of the Mason No. 2 tribe were there and undesired; they made accordingly but low figures. Some of the shorter pedigrees were animals of substance. Mr. Doyne, Mr. Cosby, and Mr. Humphrey Smith made several purchases of them. The sale throughout was dull, Mr. Meadows being unable to be present, but the average of over £50 told up well for the 22 head sold.

COWS AND HEIFERS.

Bracelet 2nd, roan, calved January 14, 1864; by Vanguard (21009), out of Bridal by Buckingham (11219).—Mr. Cruickshank, Aberdeen, 290 gs.
Ruth 20th (Mr. Cooke's), roan, calved February 24, 1866; by Knight of the Empire (22061), out of Ruth 14th by Lord Aberdeen (20141).—Mr. R. G. Cosby, 42 gs.
Virginia, red, calved January 28, 1867; by First Fiddle (19749), out of Vanity by Paddy Hopewell (16677).—Mr. H. Smith, 40 gs.

British Queen, roan, calved April 26, 1867; by Duke of Marlborough (23768), out of Ruby Queen by Grey Gauntlet (19908).—Mr. S. Armstrong, 31 gs.
Fanny 15th (Mr. Cooke's), red and a little white, calved June 29, 1867; by Duke of York (23804), out of Fanny 10th by Dr. McIlale (15887).—Mr. Cruickshank, 26 gs.
Golden Locket, roan, calved September 6, 1867; by Grey Gauntlet (19908), out of Golden Rose by Blood Royal (14169).—Mr. J. Downing, 80 gs.
Golden Pin, roan, calved August 14, 1868; by Duke of Marlborough (23768), out of Golden Rose by Blood Royal (14169).—Mr. J. Downing, 62 gs.
Island Queen, red and white, calved February 5, 1869; by Duke of Marlborough (23768), out of Ruby Queen by Grey Gauntlet (19908).—Mr. S. Armstrong, 34 gs.
Fanny 28th, roan, calved April 25, 1869; by Prince of the Realm (22627), out of Fanny 16th by Fugleman (14580).—Mr. H. Smith, 20 gs.
Ruth 25th, roan, calved January 24, 1870; by St. Ringan (27417), out of Ruth 20th (lot 2) by Knight of the Empire (22061).—Mr. L. C. Crisp, 67 gs.
Victorine, roan, calved February 23, 1870; by Prince of the Realm (22627), out of Vanity by Paddy Hopewell (16677).—Mr. R. G. Cosby, 38 gs.
Fanny 33rd, red and white, calved January 23, 1871; by Prince of the Realm (22627), out of Fanny 14th by Fugleman (14580).—Mr. H. Smith, 31 gs.
Chenedolle, red, calved January 24, 1871; by Prince of the Realm (22627), out of Canzonette (dam of lots 20 and 24) by First Fiddle (19749).—Mr. C. M. Dozne, 80 gs.
Medora, roan, calved April 11, 1871; by Peer of the Realm (27057), out of Graceful by Duke of Moscow (14447).—Mr. R. J. Stanton, Canada, 52 gs.
Princess Charlotte, roan, calved May 12, 1871; by Prince Mason (29645), out of Camisole by Fugleman (14580).—Mr. C. M. Dozne, 20 gs.
Queen of the Meadow (Mr. S. Armstrong's), roan, calved January 21, 1872; by Prince Buckingham (29603), out of Ruby Queen by Grey Gauntlet (19908).—Mr. H. Robert, 29 gs.
Fairly Queen (Mr. S. Armstrong's), red, calved March 12, 1872; by Prince Buckingham (29603), out of British Queen (lot 4) by Duke of Marlborough (23768).—Mr. H. Robert, 30 gs.
Honey Bee (Mr. S. Armstrong's), roan, calved March 21, 1872; by Peacock (29536), out of Honeysuckle by Marine (24529).—Mr. T. Rudd, 18 gs.
Musidora, roan, calved March 25, 1872; by Prince Mason (29645), out of Graceful by Duke of Moscow (14447).—Mr. J. Downing, 20 gs.
Chardonoret, red and white, calved April 23, 1872; by Prince Mason (29645), out of Canzonette by First Fiddle (19749).—Mr. J. Cooke, 22 gs.
Princess of Wales (Mr. Gumbleton's), rich roan, calved February 8, 1873; by Red Cross (32247), out of Truelove by Ducrow (19591).—Mr. S. Pickering, Canada, 54 gs.
Fanny 35th, white, calved May 21, 1873; by Prince Mason (29645), out of Fanny 14th by Fugleman (14580).—Mr. J. Ward, 20 gs.

SUMMARY.

Total sale.....	£1,108	16	0
22 head averaged.....	50	8	0

SHEEP SALES AND LETTINGS.

MR. BUSHBY'S SOUTH DOWNS.—The annual sale and letting took place at West Preston Manor, near Angmering Station. The sale comprised 18 rams for sale and hire; 10 ram lambs and 115 ewe and wether lambs, and 100 breeding ewes for sale. Sixty wether lambs sold from 30s. to 45s. each; the ewe lambs averaged 31s.; breeding ewes ranged from 38s. to 61s. Rams let and sold from five guineas to 16½ guineas, and ram lambs sold from five guineas to 9½ gs.

MR. BENNETT'S HAMPSHIRE.—Messrs. Ewer and Winstanley sold and let by auction, at the Market House-yard, Salisbury, 70 ram lambs and 10 rams, the property of Mr. W. Bennett, of Chilmark. The first four lots were let for a month from any date, and the prices realised were as follow: Mr. Brown, Uffcott, 10 guineas; Mr. White, 10½ gs.; Mr. White, 19 gs.; Mr. Coombes, 19 guineas. The next seven lots were let for a month from the 6th of September, at the following prices: Mr. John Read, 39 guineas; Mr. Charles Waters, 26 guineas; Mr. John Read, 10 guineas; Mr. Parsons (Waddon), 10 guineas; Mr. J. Carpenter, 10½ guineas; Mr. A. Budd, 26 guineas; Mr. Khusman, Craubury Park, Winchester, 10 guineas—the average being £18 2s. 11d. per head.

MR. HANBY'S COTSWOLDS.—This was the first sale, Mr. Villar, of Cheltenham, being the auctioneer. There was a large attendance, and about 50 animals were sold at an average of £7 12s.

MR. LANE'S COTSWOLDS AT BROADFIELD.—Mr. Acock, of the firm of Acock and Hanks, was the auctioneer. Two 3-shear sheep and three shearlings were let, the highest price being given by Mr. Brown, of Marham, Norfolk, 9 gs. 47 were sold, the highest figure being 66 gs., which was given by Mr. Coleman, of New Zealand. The average of the lot was £20 0s. 4d., and the net proceeds of the sale amounted to £1,135 1s.

MR. R. GARNE'S COTSWOLDS, AT ALDSWORTH.—Mr. Acock officiated as auctioneer, and let 2 shearlings, the highest priced one to Mr. G. Hewer, Leygore, for 46 gs.; 51 passed the hammer, at the high average of £22 1s. 9d. Mr. Brown, of Marham Hall, Norfolk, gave the highest figure, 78 gs. The total amount realised was £1,170 15s.

THE TROY RAMS.—48 animals were offered for competition; but owing to the long continuance of drought and entire failure of the root crops in the Midland Counties, they did not realise extraordinary figures. For several of the animals a sharp competition ensued, resulting in the average of £10 1s. 6d.

OXFORD RAM SALES.—The first of these annual gatherings was inaugurated in Smith's Close, when there was an extraordinarily full attendance of flockmasters, breeders, and dealers. The following are the particulars of the sales.—By Messrs. Paxton and Castle: The first lot consisted of 24 shearing Cotswolds, the property of the Executors of the late Mr. R. Lord, of Stanton Harcourt; the highest price realised was 11½ gs., the average being £7 1s. 6d. 11 Cotswold ram lambs, bred by and the property of Mr. H. Gillett, of Southleigh; the highest price realised was £6, and the lot averaged £4 5s. 8 Cotswold shearing rams, bred by Mr. C. Gillett, of Lower Haddon; average £5 15s. 6d. Cotswold shearing rams, bred by Mr. S. Smith, of Somerton; average £9 9s. The Cotswold shearing rams drafted from the flock of Mr. John Worley, of Brize-Norton; the average was £7, and the highest price was 9 gs. 15 Oxfordshire Down ram lambs, bred by Mr. C. Badcock, of Radley. The highest price reached for these was £7 10s.; average £4 7s.—By Messrs. Acock and Hanks: 15 Cotswold ram lambs, the property of Mrs. Smith, of Shilton, near Burford, averaged £4 16s. 6d.—By Messrs. Franklin and Gale: 25 Cotswold ram lambs, the property of Mr. Thomas Akers, of Burton Abbots, realised from 3½ to 7½ gs.

MR. HUGH AYLMER'S LONGWOOLS AT WEST DERHAM.—Mr. Simpson offered the 100 ram lambs. These realised a total sum of £575 5s., and averaged £5 15s. each. The highest price given for a ram lamb was £10, the lowest £4 10s. The 80 shearlings realised £927 1s., an average of £11 11s. 9d. The highest price given for a shearerling was £42, the lowest £7 17s. 6d. The 10 two-shear sheep made £92 18s. 6d., an average of £9 6s. each. The highest price given for one of these sheep was £15 15s., the lowest £7 7s. The total proceeds of the letting were £1,597 7s. 6d.

MR. WALKER'S COTSWOLDS.—There was a large attendance, including the leading top breeders of the neighbourhood, and the sheep were considered to be the best offered this season. Mr. Acock, of the firm of Acock and Hanks, offered the first sheep, which was knocked down at £24 3s. Sheep after sheep was brought forward and speedily disposed of, till No. 20 was brought into the ring, when it was plain there was something more than usual in that number. The biddings quickly rose from £20 to 70 guineas, when there was a halt for a few seconds. From this sum the biddings rose to 75 guineas, and then to 100 guineas. Finally this sheep was knocked down at 102 guineas, to go to Canada. The other twenty were quickly disposed of. The forty, which averaged £21 4s. 9d. each, were all disposed of in about an hour.

MR. RIGGS'S HAMPSHIRE DOWNS.—One hundred and twenty ewes were sold at Wrotham-hill Park. One pen made £4 per head, and several lots went into Lancashire. They averaged 58s. For the rams there was but a poor trade. A few were let at 8s.; one of the shearlings went at 10gs. Those disposed of averaged £6 10s. 9d. A number of store cattle were sold at moderate prices.

THE WOOLING HAMPSHIRE.—At this sale, by Messrs. Waters, Son, and Rawlence, the prices ranged at 12½ gs. and 10½ gs., two at 10 gs., 9½ gs., and 9 gs., several at 8½ gs., 8 gs., 7½ gs., 7 gs., and 6 gs., down to (for young lambs) 4½ gs. and 4 gs., and two at 3 gs., the average of the whole being 6 gs.

THE BULBRIDGE HAMPSHIRE EWES.—Messrs. J. and E. Rawlence have held their second and last sale at Bulbridge, when they offered the whole of their flocks of Hampshire Down ewes, consisting of about 1,090 ewes and ewe lambs. The auctioneers were Messrs. Ewer and Winstanley. The sheep were in lots of ten each (except where otherwise expressed), and the sale commenced with the two-tooth ewes, when the following purchases were made: Mr. Simmonds (agent to Mr. Walter, Bearwood), £55; Mr. Dibben, Bishopstone, £72 10s., and £77 10s.; Mr. Newton, Dogdean (five), £57 15s.; Mr. Charles Waters, £92 10s.; Mr. Smith, of Stapleford (five), £70 17s. 6d.; Mr. A. Morrison, Fonthill, £50, and five, £42 10s.; Mr. Pain, of Frilsham, Berks, £52 10s. and £42. The following were among the purchasers of the four-tooth ewes: Mr. Pain, £57 10s.; Mrs. Brice, Wollhall, £70; Mr. Newton (five), £49 17s. 6d.; Mr. Holdsworth (steward of the Earl of Pembroke), £47; Mr. Taylor, £45 and £55; Mr. Simmonds, two lots at £40 each; Mr. Tutchen, from Basingstoke (five), £30; Mr. Lambert, of Abingdon, £40; Mr. Moore, of Littlecott, £44; and Mr. Homer, Athelhampton, £49. Amongst the purchasers of the six-tooth ewes were—Mr. Pain, £57 10s.; Mr. Morrison, £57 10s.; Mr. H. Brine, of Gussage (five), £31 5s.; Mr. Taylor, £15; Mr. Homer, £42; Mr. Simmonds, £43; Mr. Buxton, of Ware, £40; Mr. Godwin, of East Stour, £40. The following were the purchasers of the full-mouthed ewes: Mr. Homer, £31 10s. and £35, Mr. Coles, Warminster, £44; Mr. Simmonds, £36 and £33; Mr. Brine, Gussage, £32 10s., and five at £21 5s. Mr. Webb, of Newbury, £31, £31 10s., and £32 10s. Among the purchasers of the Chilver lambs were Mr. Morrison, a lot at £170; Mr. Taylor, £80; Mr. Buxton, £33 10s. Mr. Holdsworth, £34. The 1,095 ewes and ewe lambs realised £4,500. The averages were: Two-tooth, £5 8s. 10d. each; four-tooth, £4 11s. 5d.; six-tooth, £4 15s. 11d.; full-mouthed, £3 6s. 10d.; Chilver lambs, £3 19s. 6d.; the total average per head being £4 8s. 6d.

MR. PARKER'S HAMPSHIRE.—Messrs. Downs and Awbery have disposed of the Lasham Flock, late the property of Mr. J. Parker, deceased. Twenty-three ram lambs were first disposed of, and produced £414 4s. 6d., an average of over £18, Lot 3 being secured by Messrs. R. and J. Russell, of Horton, Kerby, Kent, at 50 gs. Lot 6 made 40 gs. Mr. A. Tutchen, North Oakley, purchased Lot 9 at 22 gs., Mr. F. Budd Lot 12 at 40 gs., Mr. Pearce Brown Lot 15 at 26 guineas, Messrs. Russell Lot 30 at 36 gs. The average price of the whole flock was £4 7s. 6d. per head.

MR. LUNN'S RAMS.—Messrs. Waters, Son, and Lawrence at Andover Tlation, conducted the sale of rams belonging to Mr. Lunn, of Woolding Farm, Whitechurch, Hants. The prices ranged at 12½ gs., 10½ gs., two at 10 gs., 9½ gs., 9 gs., several at 8½ gs., and 8gs., 7½ gs., 7gs., 6gs., down to (for

young lambs) 4½ gs. and 4gs. and two at 3gs., the average of the whole being 6gs.

MR. CHARLES WATERS' HAMPSHIREs.—The sale of 76 ram lambs, took place at the Market House, Salisbury, being conducted by Messrs. Waters, Son, and Rawlence. The prices obtained were for letting 23 guineas, 10½ guineas, 7 guineas, and 6 guineas; and for lambs sold 14½ guineas, 12 guineas, 11½ guineas, 10½ guineas, 9½ guineas, 9 guineas, 8½ guineas, 8 guineas, 7 guineas, down to 5 guineas, the average being £5 each. Eighteen of the younger lambs were passed without a bid. Mr. Coles, of Middleton Farm, Warminster, hired No. 3 for one month from 1st September for 23 guineas. 10 ram lambs, the property of Mr. G. Read, of Charford; the highest brought 9½ guineas. The average was £5 10s.

MR. NEWTON'S HAMPSHIREs.—At Dogdean, Messrs. Waters, Son, and Rawlence offered about 100 ram lambs and 10 rams, the property of Mr. William Newton. The sale commenced with the letting of 12 ram lambs, No. 4 being let to Mr. Dibben at 25 gs.; No. 8, to Mr. E. Pinckney (Berwick), at 23 gs.; No. 5, to Mr. William Floyer (Ridge), at 14 gs., who also hired No. 7, at 9 gs.; and No. 3, to Mr. Carpenter, at 11 gs. The selling lambs produced considerable competition, the average of the first 40 being £11 11s. 3d. The principal purchasers were Mr. E. Pinckney, who secured No. 26 at 20 gs., No. 36 at 13 gs., and No. 83 at 15 gs.; Mr. Smith (Stapleford), No. 15 at 15 gs., and No. 17 at 15½ gs.; Mr. C. Friend (Gussage), No. 13 at 18 gs.; Mr. F. G. Dalgety, No. 20 at 16 gs.; Mr. H. Friend, No. 39 at 15 gs., No. 40 at 14½ gs., No. 49 at 9½ gs., and No. 52 at 9 gs.; Mr. R. Friend, No. 22 at 13½ gs., No. 12 at 9 gs., &c.; Mr. Hayter (Woodgates), No. 33 at 13 gs., No. 50 at 11 gs., and No. 72 at 9½ gs.; Mr. Fleetwood (Coombe), No. 27 at 13 gs.; Mr. Pinniger (Rockbourne), No. 25 at 11½ gs., No. 53, at 11 gs., Nos. 30, 32, and 34, at 10½ gs. each, No. 45 at 9½ gs., and Nos. 46 and 48 at 9 gs. each; Mr. Warner (Liss, Petersfield), No. 38 at 11 gs., No. 10 at 10½ gs., No. 14 at 9 gs., and No. 56 at 8 gs. The average of the whole was £99 7s. 10d.

MR. PREECE'S SHROPSHIRE SALES AT SHIREWSBURY.—The numerous purchasers had some 150 flocks to select from. As might have been expected, Lord Chesham obtained the highest prices, and the highest average ever yet reached for Shropshire rams. A shearing ram, sire, grandson of Duke of Manchester, let for 95 gs.; and another let for 25 gs. A two-shear ram, sire, son of Mansell's No. 8, sold for 115 gs.; a shearing sold for 105 gs., one at 70 gs., and one at 65 gs. The 21 brought in a total of 728 gs., giving an average of nearly 35 gs. per head. Mr. Craue, of Shrawardine, let a two-shear ram, Caligula, for 46 gs., and Mr. J. Evans, Ullington, let a shearing ram, by Grand Duke, sire of dam Hardlines, for 85 gs. Mr. T. Horley, The Fosse, Leamington; Mr. G. Allen, Knightley Hall; and Mr. W. Marson, Butterhill, also sold several rams at satisfactory prices. The following were among the prices obtained for ewes: Mr. Craue's lot from 60s. to 80s.; Mr. John Evans, 50s. to 200s. each; Lord Chesham's, 60s. to 80s.; Mr. J. W. Minton, 65s. to 95s.; Rev. C. P. Peters, 70s.; Mr. R. Edwards, 130s. Mr. G. Horton, 65s. to 85s.; Mr. Bowen Jones, 60s. to 130s.; Mr. R. Jones, 50s. to 105s.; Captain Wingfield, 60s. to 73s. 6d.; Messrs. J. and G. Craue, 60s.; Mr. W. Andrews, 60s.; Mr. H. Lee, 65s.; Mr. Peter Everal, 60s.; Mr. Frank, 55s. to 105s.; Mr. A. Mansell, 50s. to 60s.; Mr. W. G. Preece, 55s. to 65s.; Mr. W. Holder, 48s. to 60s.; Mr. G. T. Forester, 45s. to 60s. Besides the above there was a large supply of well-bred ewes sent by numerous well-known breeders.

MESSRS. LYTHALL AND CLARK'S SHROPSHIREs IN BINGLEY HALL.—The trade ruled slow, many animals passed through the ring unsold, and other breeders had to submit to a fall from last year of about 30 to 50 per cent. The thirty rams exhibited by Mr. Joseph Pulley, of Lower Eaton, Hereford, attracted most attention; and one, the commended sheep at Bedford, was bought by Mr. Crawford for 34 gs. Mr. William Baker, of Staffordshire, secured the next sheep, a shearing, at 36 gs. Others made 30, 31, and 35 gs. each, the average of the thirty sheep, all shearlings, being a trifle under 15 gs., which, however, is little more than half the sum realised by the same breeder last year. Mr. Thos. Nock, of Shiffnal, showed ten shearlings and one two-shear; two of the former were let, and the nine sold averaged

£13, the highest price being made of No. 3, who was bought for Mrs. Henry Smith, of Sutton Maddock, for 23 gs. Mr. H. S. Sheldon, of Brailes House, Shepston-on-Stour, showed nine sheep, which realised a trifle under 11 gs. Mr. E. Lythall, of Radford-hall, Leamington, showed thirteen yearlings; the highest figure was 25 gs., and the average £11 4s. 6d. Lord Sadely's rams made about £8, and Lord Wenlock's, from Yorkshire, £7 5s., about half the price realised last year. There are about 500 ewes in the catalogue, not all present; purchasers were found for most if not all, but the drop was even greater than in the rams. Mr. Pulley's shearing ewes commanded the best average, making 65s. a head. Ten lots of Show shearlings, belonging to Mr. Rock and Mr. Sheldon, made an average of 7½ gs. per head, prices of the remainder ranging from 42s. to 50s. a-head.

MR. COXON'S SHROPSHIREs.—Mr. W. G. Preece conducted the annual sale and letting at Freeford, of Mr. Coxon's selection of Shropshire sheep, which this year consisted of 36 rams and 100 ewes, the whole of which very successfully realised remarkably good prices, taking into consideration the want of keep, shortness of capital, and the dulness of trade. The ram Confidence was first put into the ring and offered to let. This sheep won third prize at Hull R.A.S.E. last year as a shearing. Twelve of his ewe lambs were run into the ring with him. After a very spirited competition between the most celebrated breeders of Shropshire, he was knocked down to Mr. Cartwright, Burton-on-Trent, at the extraordinary sum of 200 guineas for the season. If Confidence had been offered for sale there is no knowing what price he would have made, and 500 guineas we heard had been offered last spring for him, but refused. Champion, winner of the first prize at Manchester, was let to Mr. C. W. Hamilton, Ireland, at 115 gs.; Capitalist (a two-shear) sold to Mr. R. H. Masfen, at 57 gs.; Consolation (a two-shear), 55 gs., to Mr. W. H. Clare; 3, a shearing, 63 gs., to Mr. C. Stubbs. The Hon. Lord Falmouth purchased Safeguard, 16, at 53 gs., and No. 4 at 23 gs. Mr. German purchased two rams at 42 gs. and 31 gs. each. Lot 5, 32 gs., Mr. Farmer, of Cheadle; lots 17 and 18 went to Mr. Pilgrim at 21 and 23 gs. Lord Bateman, Mr. Winterton, Mr. C. R. Keeling, Mr. T. J. Mansell, Mr. Barnes, Mr. Booth, Mr. Kinghorn, for the Rev. W. Inge, and other well-known breeders obtained specimens from this renowned flock at from 12 to 40 gs. each. The average is about 31 guineas. The ewes were sold for the season at prices ranging from 8 to 60 gs., amongst the buyers being Messrs. Holland, Firminstone, Cartwright, Woodall, Baggalay, Fowler, Meakin, Salt, Bury, and Ball.

MR. R. H. MASEN'S SHROPSHIREs.—This sale took place at Pendeford, Mr. Preece officiating. Only two rams were let, Roman for 53 gs., and The General for 8 gs. Of the fifty-five which were sold, The Admiral brought the highest figure, namely, 51 gs. The next best prices were 45 gs. for Wildboy, 45 gs. for Captain, 30 gs. for Lord Rockingham, and 25 gs. for Nobleman. Several others brought 20 gs. each. 130 ewes were brought forward in lots of five, and some rather spirited competition ensued. The best pen made 165s. each ewe; others 85s., 80s., and 70s. each.

MRS. H. SMITH'S SHROPSHIREs.—Mrs. H. Smith, of Sutton Maddock, held her annual sale of Shropshire rams and ewes, when Messrs. Lythall and Clarke brought forty rams and seventy-five ewes to the hammer. The rams realised the good average of 13 gs. each, the prices ranging from 36 gs. downwards, and the ewes fetching from 10½ to 4 gs. each, and realising an average of 4½ gs. each.

CIRENCESTER RAM FAIR.—Mr. Barton sent 23 rams, which made the average of £16 3s. The highest prices ranged from 24 gs. to 49 gs. Last year Mr. Barton made an average of £10 6s. for 31 sheep. 18 rams from the flock of Mr. E. Fowler, of Aston Farm, went at an average of £8 18s.; being £6 17s. less than last year, when the number was 30. 7 sheep of Mr. Thomas Clarke's, of Frampton Mansell, made an average of £7 each; last year's average was £9 9s. Mr. J. Villar sold the following: 27 Cotswold rams from the flock of Mr. Thomas Porter, Baunton, at an average of £7 10s. 9d., the highest price being 15 gs. Mr. Porter's average last year was £10 15s. 6d. for 30 sheep. Mr. Villar next sold 13 Cotswolds from Mr. H. Cole, Ashbrook, at an average of £8 15s. 6d., the highest lot realising 16 gs. Last year's average was £12 2s. 3½d. for 29

sheep. Mr. Villar then offered 35 Oxfordshire Down rams from the flock of Mr. Charles Hobbs, of Moysie Hampton, at an average of £11 16s.; one of the lots realised 21 gs. Messrs. Acock and Hanks sold 36 Cotswold rams, the property of Mr. C. Barton, Fifield, realising an average of £11 12s. 9d., one being bought by Mr. Jacobs, of Bury Barns, Burford, for 30 gs. Mr. C. Pinnell, of Westwell, and Mr. Garne, of Filkins, also bought rams at 22 gs. and 20 gs. respectively. Messrs. Acock and Hanks next offered 8 rams from the flock of Mr. Russell Swanwick, of Cirencester, at an average of £10 11s., the highest price being 15 gs. 18 rams, bred by Mr. J. Gillett, of Tangley, realised an average of £10 14s. 8d., the highest price being given by Mr. Clarke, of Frampton Mansell, 27 gs. 20 rams from Mr. J. Pedley, of Bibury, averaged £9 2s. 8d. (a few shillings higher than last year), two of the number bringing 18 gs. and 17 gs. 12 rams, bred by Mr. Joseph Walker, of Compton Abdale, averaged £9 1s. 12 rams from the flock of Mr. Jacobs, Bury Barns, Burford, realised an average of £9 9s. 17 rams from Messrs. T. and S. Gillett's flock, of Kilkenny, brought an average of £7 15s., against an average last year of £6 19s. 6d. 10 rams bred by Mr. G. Hewer, of Northleach, averaged £7 1s., little more than half last year's average. There were also offered for sale 20 Oxfordshire Down rams, bred by Mr. Samuel Davis, of Sevenhampton. The 19 sold realised an average of a little over £12 12s., the highest price obtained being 20 gs. This was a slight increase on the average of last year. 40 shearing Cotswold rams, bred by and the property of Mr. Henry Howell, offered at Coates, realised an average of £11 3s. 4d., the highest price obtained being 40 gs. Last year's average was £12 12s. Mr. Newton's Hampshire Downs were sold at Iley fair by Messrs. Franklin and Gale, of Wallingford; there were 73 ram lambs and 1 two-toothed sheep. The highest priced lamb was knocked down to A. Morrison, Esq., Fonthill Wilts, for 28 gs., Mr. John Kirby, of Moreton, securing another at 27 gs., and the prices of the others ranging from 4½ gs. to 16 gs. 72 out of the 74 others being sold at an average of £8 a piece.

THE MARIAM COTSWOLD LETTING.—The annual letting of Mr. Thomas Brown's celebrated Norfolk Cotswold rams took place at the Marham Hall Farm, Downham Market, under the direction of Salter and Simpson. The 100 rams lambs averaged £6 3s. each; the 80 shearing rams averaged £11 17s. 6d. each; and the 10 two-shear rams averaged £7 7s. each, the total proceeds of the letting being £1,650 13s. 2d. Amongst the hirers were Messrs. Robert Garne, Aldsworth, Gloucestershire; T. H. Coleman, New Zealand; and Thomas Allen, Markshall.

MR. J. GIBLIN'S COTSWOLD AND OXFORD DOWNS.—This sale took place at Little Bardfield. The following is the general result: Cotswolds, 35 shearlings, averaged £8 9s. 8d.; 2 two-shears, £5 each. Oxford Downs—Eight shearlings averaged £6 19s. 7d.; 2 two-shears, £5 each.

MR. HALL'S LEICESTER RAMS.—The Scarborough rams were let by auction, at Scarborough, near Beverley. There was a very large attendance of the leading farmers of the neighbourhood, and also many from other counties and from Ireland. The number of sheep offered was ninety, of which fifty-five were shearlings. The average price of the shearlings was £7 15s., and the aged sheep £7 12s. 6d. The total average was £7 13s. 6d. per head. The highest price given for a shearling was £17 10s., and for an aged sheep £15 15s.

MR. H. FOOKES'S SOUTHDOWNS.—Mr. T. Enson, of Dorchester, submitted 80 Southdown rams and 150 ewes from the flock of Mr. H. Fookes, of Whitechurch. The sale and letting took place in the fair-field, Blandford, and commenced with the two-tooth rams, of which there were fifty offered, in lots of ten, alternately for sale and letting. The highest of the first 10 was let for 16 guineas to Mr. John Scutt, of Winforth, near Dorchester; lots 13 and 17 were bought by Mr. Hutchings, of Chard, at 15 guineas each. The third ten, from 21 to 30, were a very fine lot of sheep. Lot 21 was let at 21 guineas; 22 was let to Lord Walsingham at 55 guineas; lots 23 and 24 were let for 13 and 10 guineas, and 30 for 20 guineas. The six-tooth rams were sold at 11 guineas and 6 guineas. Colonel Kingscote, of Kingscote, Gloucester, purchased lot 56 at 17½ guineas; and 57, which formed the first prize at Dorchester show last year, was sold to Mr. John Ford, of Rushton, at 18½ guineas. The

average of those sold and let at the sale was about 11 guineas per head. Down ewes realised from 47s. to 50s.

MESSRS. MANSELL'S SHROPSHIRE.—This sale took place at Ercall Park, near Wellington. About 40 rams and 120 breeding ewes were sold by auction, by Mr. Preece. The average for the rams was about 21 guineas each, and the ewes ranged from 60s. to 93s. each.

MR. G. WALLIS' OXFORDSHIRE DOWN RAMS.—Messrs. Paxton and Castle sold at Old Shifford, Faringdon, 50 shearing rams and 50 ewes, at an average of £14 2s. 8d. This was the first auction sale of sheep held at Shifford.

MR. TREADWELL'S OXFORDSHIRE DOWNS.—At Mr. Treadwell's seventeenth annual sale, about 50 Oxfordshire shearing rams, together with a few older sheep, were submitted to competition by Mr. J. A. Mumford, at the Model Farm, Upper Winchendon. There was a numerous attendance of purchasers. In 1871 the average was something over £13 13s., in 1872 it reached upwards of £18, and in 1873 it exceeded £23; this year, however, owing no doubt to the dry season, the average was only £17 1s. 3d. The total proceeds of the sale amounted to £921 3s. The following were the chief sales: Mr. Street, £22 1s.; Mr. Mather, £21; Mr. W. Scovell, £21; Mr. R. Foster, £21; Mr. N. Stulgoe, £21; Mr. P. Bulford, £31 10s.; Mr. Taylor, £22 1s.; Mr. Tanner, £31 10s.; Mr. Cooper, £21; Mr. Roberts, £21; Mr. Wright, £21; Mr. King, £22 1s. The Winchendon estate, which includes Mr. Treadwell's farm, has just been sold by the Duke of Marlborough to Baron Ferdinand de Rothschild, the son of Baron Rothschild of Austria, whose death was recently announced.

MRS. BEACHT'S SHROPSHIRE.—This annual sale took place at the Hattons, Brewood, Penkridge. The catalogue comprised 31 entries of shearing rams, four older rams and twelve pens of five each, ewes and heaves. The sale, conducted by Mr. J. B. Lythall, commenced with the shearing rams; the first lot submitted being the reserved at Bedford, which fell to Mr. Preece for 50 guineas. Several subsequent lots bordered on that sum, fetching 48 (to let), 40 and 50 gs., until at the eighth lot, which, with the succeeding was also on hire for the season, let for the season at 135 gs. to Mr. Crawford. After this the hammer fell to what may be termed ordinary prices ranging from 25 to as low as 8 gs. for shearlings, while the highest prices made for the older rams was 26gs., the shearing rams averaging £25 3s. 6d. each, including three or four let for the season. For the heaves and young stock ewes there was a deal of competition, but the prices were not comparable with former years, the highest figure in the ewes class being 12 gs. each for a pen of five show heaves. The other lots of heaves made from 70s. to 80s each, and the young stock ewes from 67s. 6d. to 10½s. each.

OXFORDS AND COTSWOLDS AT OXFORD FAIR.—Messrs. Paxton and Castle sold by auction some Oxfordshire Down stock ewes, from the flock of Mr. J. Jakeman, Chesterton Fields, the average being 41s. 6d.; 30 ewes of this class, the property of Mr. H. Howse, Weston-on-the-Green, averaged 50s.; 75 ewes of the same age and breed drafted from the flock of Mr. J. Kowles, Weston-on-the-Green, obtained the average of 47s. 6d., including the largest figured pen in the fair, which reached 58s. per head. About 500 sheep were penned, consigned by the Earl of Jersey (Middleton Park), Messrs. W. Kowles (Weston-on-the-Green), Cave (Merton), Waine (Blackthorn), G. T. Drake (Bignell House), and other flockmasters in the district. The ram business was excessively slow, but 6 Oxfordshire Downs from the flock of Sir Henry W. Dashwood, Bart., Kirtlington Park, averaged £7 14s. The prices ranged between 5½ gs. to 12 gs., the purchaser of the highest-priced animal at the latter sum was Mr. Brett, Walton, Stoney Stratford. A few shearlings selected from the flock of Mr. F. Gillett, Upton Downs Farm, Burford, changed ownership at from 5½ gs., averaging £7 5s. Some shearlings of the same class, the property of Mr. Howe, Weston-on-the-Green, fetched from 4½ gs. to 5½ gs. each, 8 Cotswold shearlings made from 5½ gs. to 8 gs., averaging £6 10s.

MR. DIBBEN'S HAMPSHIRE.—Messrs. Ewer and Winstanley offered at the Market House Yard, Salisbury, about 100 ram lambs and rams, the property of Mr. E. Dibben, of Bishopstone. The letting of ten ram lambs for a month or for the season was proceeded with, and the following prices were realised: 8½ gs., 9 gs., 28 gs., Mr. Taylor, 8 gs., 8 gs., 9½ gs., 9 gs., 9 gs., 21 gs., Mr. W. Bennett; 8 gs. The

Following prices were realised for the lambs offered for sale: 7 gs. (three lots), 10 gs., Mr. King; 20 gs., Mr. Pinckney; 17 gs., Mr. Pearce Brown, Burdop; 6½ gs., 5½ gs., 13½ gs., Mr. Ferris; 26 gs., Mr. Pearce Brown; 7 gs., 5½ gs., 6 gs., 7 gs., 23½ gs., Mr. Pearce Brown; 10½ gs., Mr. Ferris; 5½ gs., 6 gs., 6½ gs., 14½ gs., Mr. Baxton, Essex; 13 gs., Mr. Pearce Brown; 13 gs., Mr. Pearce Brown; 9½ gs., Mr. Ferris; 9½ gs., Mr. King; 17½ gs., Mr. Parry; 8½ gs., Mr. Pinckney; and 6 gs., Mr. Brauston.

SOUTHDOWNS.—Messrs. Wyatt and Son held their second annual sale of Southdown rams at Chichester. The catalogue contained 58 lots, drawn from the flocks of Mr. G. W. Homer (Dorchester), Mr. A. T. Newman (Westlean), the Earl of Portsmouth, Mr. H. Upton (Aldwick), Mr. C. Combes (Birdham), and Mr. F. Padwick (Thorney). Fifteen of Mr. Homer's sheep sold at prices ranging from £3 to £5 15s.; the average price being £4 5s. Mr. J. Boys, of Compton, was the principal purchaser. Mr. A. T. Newman's two two-tooths were let for the season at 11½ gs. (to Mr. F. Busby), and at 10½ gs. (to Mr. H. E. Sadler). Of those sold Mr. Habin gave 12 gs. for a two-tooth, and the others fetched 10½ gs., 10 gs., 8 gs., 6 gs., and 4 gs. each respectively. The Earl of Portsmouth's, which included five two-tooths bred by Lord Walsingham, sold at from £4 to £6 15s., the last price being given by Mr. Field, who was buying for Mr. Goater, of Findon. Mr. H. Upton sent nine for sale, the highest price realised being £5 (Mr. Field). Five of Mr. Combes' sold at from £2 10s. to £3 7s. 6d. Mr. Padwick only had two in the catalogue—a couple of two-tooths from the late Mr. John Pinnix's breed; and Mr. C. Combes took both, the price being 6 gs. each.

LAMMAS LAMB SALE AT ST. BOSWELLS.—The annual great sale of lambs, inaugurated several years ago by the Messrs. Swan, took place again at St. Boswells. There was a large attendance of farmers and dealers, not only from the northern counties of Scotland, but from various counties of England, and several from Ireland. The sales were an improvement on the recent markets—no doubt occasioned by the recent showers and the excellent turnip prospect in the Border counties. Lambs were selling at prices rather higher than those obtained at St. Boswells Fair, but, in comparison with last year, first-class lambs would be from 6s. to 8s. lower, and second class lambs, which sold unequally, were sold at reduction of from 7s. to 10s. a-head. The number disposed of was nearly 30,000.

THE MARKSHALL RAMS.—The annual letting of Mr. Allen's longwools took place at Marshall Farm, when the result of the letting was as follows: There were forty lambs let at an average of £4 10s. 6d., forty-five shearlings averaged £8 7s. 6d., and five two-shear sheep averaged £5 5s. The highest price paid for a lamb was £12 10s., for a shearing £22 10s.

MR. DAVIES' SHROPSHIRES.—Mr. E. Sunderland sold in the Hereford market some Shropshire rams, belonging to Mr. Davies, of Burton Court, at prices ranging from 5 gs. to 10 gs.

SUFFOLK LAMB SALES.—Mr. Robert Bond held his third Sutton lamb sale at Woodbridge. The number of lambs was considerably in advance of that of either of the preceding sales, about 3,500 being brought to the hammer. Amongst those who favoured Mr. Bond with instructions were—Mr. J. S. Clarke's Executors, Eyke; Messrs. C. Walker, Melton; W. Toller, Gedgrave; W. W. Flat, Wantisden; J. Smith, Hasketon; S. Wolton, Butley; G. Eastaugh, Sudbourne; D. Nunn, Eyke; J. Toller, Blaxhall; W. H. Borrett, Tunstall; Mrs. Borrett, Framlingham; Messrs. R. Cooper, Iken Hall; D. Burrows, Dallinghoo; A. Bendall, Sutton; A. Smith, Eyke; R. Welton, Marlesford; T. Roberts, Alderton; H. M. Gobbit, Capel St. Andrew; E. T. Duckett, Sutton Haugh; A. Talman, Saxstead; C. K. Cordy, Trimley; J. B. Cordy, Felixstowe; R. Walker, Letheringham; W. Toller, Gedgrave; M. Murrell, Earl Soham; G. Chaplin, Sudbourne; H. Clarke, Iken; T. Waller, Sutton Hall; M. Jary, Underwood Hall; Westby, Newmarket; J. Cracknell, Wickham Market; R. C. Abilt, Grundisburg; C. Capon, Framlingham; Walker, Chillsford. There was a good attendance of buyers, including several gentlemen from a distance. One invested no less than £1,500 in stock. Trade for all descriptions was considered to be satisfactory. The highest price for black-faced ewe lambs was realised for 60 by Mr. J. M. Green's tups, bred by and the property of Mr. C. K. Cordy;

they brought 46s. each. 100 black-faced shearing ewes, consigned by Mr. J. Smith, Hasketon, realised 68s. 6d. apiece; 140 half-bred shearing ewes, from Mr. Walker, Letheringham, and bred by Mr. R. Welton, fetched 53s.; 200 black-faced ewe lambs, from Mr. J. S. Clarke's Executors, averaged 27s. 6d. each, and 320 wether lambs averaged 26s.; 200 black-faced shearing ewes, from Mr. C. Deb Walker, averaged nearly 60s. each, 160 half-bred lambs, from Mr. W. Toller, averaged 24s. 6d.; and half-bred shearing ewes, from Mr. J. Toller, made from 56s. 6d. to 61s.; 180 half-bred two-shear ewes, from Mr. D. Burrows, fetched from 44s. to 52s. and averaged 47s.; 100 black-faced ewe lambs, from Mr. Roberts, made from 29s. to 36s.; 140 half-bred lambs, from Mr. J. B. Cordy, averaged 24s. 6d.; and 200 from Mr. Murrell, realised from 22s. 6d. to 30s. 6d. each. The bulk of the half-bred lambs were knocked down at from 20s. to 30s. a-head.

MR. GERMAN'S ANNUAL SALE OF SHROPSHIRE SHEEP took place at Measham Fields. The business commenced with the shearing rams. The first fell to the bid of Mr. May, Elford Park, for £31 10s.; the second to Mr. Berry, for the same sum; the third to Mr. Price, for £19 19s.; No. 5, to Mr. F. Grettton, Burton-on-Trent, £37 16s.; 6, to Mr. Coxon, £17 17s.; 7, to Mr. Cartwright, £38 17s.; 9, to Mr. T. Tompson, Manor Farm, £25 4s.; 13, to Mr. Tompkinson, Wilson, £24 3s.; 17, to Mr. J. Mousely, £21; 19, Mr. G. F. Brown, Desford, £17 17s.; 21, to Mr. C. Mousely, £15 15s.; 24 (to let), Mr. Cartwright, £40 19s.; 25 (to let), Mr. Coxon, £15 15s.; 26, Mr. J. Ratcliff, £17 17s.; 27, Hon. F. Stuart, £15 15s.; 28, Mr. Faux, £16 16s.; 29, Mr. Madan, Elford, £16 16s.; 31, Mr. Clare, £16 16s.; 34, Mr. Loff, Bury St. Edmunds, £16 16s.; who also bought No. 10 at £12 12s., and 32 at £11 11s.; 38 (to let), Mr. F. Byrd, £26 5s.; 49, reserved No. R.A.S.E., Bedford, 1874, to Mr. Devonport, on commission, £21; 51, Mr. K. Bourne, £25 4s.; 52, Mr. Smith, £16 16s.; 50, Mrs. Walker, £15 15s.; others ranged from £6 6s. to £15 15s. The rams averaged £17 4s. 2d. each. The ewes and theaves ranged from £3 2s. 6d. to £5 7s. 6d. each, and brought an average of £3 12s. 6d. The total amount of the sale, £1,339 11s.

MR. MOORE'S HAMPSHIRES.—The second portion, consisting of 30 young ram lambs, 20 two-teeth and five four-teeth rams, together with 700 ewes and ewe lambs, of the Improved Hampshire breed, was sold by auction by Messrs. Waters, Son, and Rawlence, at Littlecott. The young ram lambs brought 9½, 8½, 7½, 7, and 6½, down to 3 gs., averaging £5 12s. 6d. each, and the two-teeth and four-teeth rams 11, 10, 9, 8½, 8, 7½, 7 gs., &c., down to 3 gs., averaging for two-teeth £6 9s. 6d., and for four-teeth £7 9s. 1d. each; for six-teeth ewes, highest 70s., lowest 50s., average 53s. 8d.; for four teeth ewes, highest 72s., lowest 53s., average 61s.; for two-teeth ewes, highest 83s., lowest 50s., average 63s. 7d. Chilver lambs, highest 31s., lowest 30s.

MR. WALMSLEY'S RAM SHOW AT RUDSTON.—The sheep were in good condition, and several fetched high prices. No. 3 was knocked down to Mr. Cranswick, Caythorpe, for £38; 30, to Mr. R. Crowe, Speeton, for £35; 10, to Mr. Bowser, Reighton, for £25, and 20, for £17; 11, to Sir Tatton Sykes, £22; 14, Mr. Simpson, Pilmore House, £24, and 2, £21 10s.; Mr. G. L. Fox, Bramham Park, 16, for £15. The total amount of the letting was £528.

SALE OF RAMS AT BRACKLEY.—Messrs. Russel and Son offered a number of Oxfordshire Down rams, the property of Mr. J. Chapman, of Westbury, and bred by Mr. King, of Winslow. The sheep were of high pedigree, being descended from the Winchendon flock. The following were purchasers, at prices annexed: Mr. Denchfield, Lillingstone, 9 gs.; Mr. A. Weston, Brackley, 5½ gs.; Mr. Hawkins, 11½ gs.; Mr. Luckett, 8½ gs.; Mr. Greaves, 8 gs.; Mr. Clarke, 9 gs.; Mr. Hawtin, 7 gs.; Mr. Luckett, 6 gs.; Mr. Salmon, 7½ gs.; Mr. George, 6 gs.; Mr. Strange, 7 gs. The average of those sold was £8 2s. 3d. per head. Two Oxfordshire shearing rams, the property of Mr. King, Bicester, were also sold: Mr. J. Bliss, 7 gs.; Mr. J. Cave, 6 gs.

SALE OF SHROPSHIRE EWES AND RAMS.—The Bridgnorth fair was held, and was very largely attended by local agriculturists and sheep breeders. Messrs. T. and F. Nock held their annual sale of Shropshire sheep in their Smithfield. The sheep included a collection of ewes and rams from flocks of breeders in the neighbourhood, viz., Mrs. Wadlow, of Haughton, near Morville; Mr. W. O. Foster, of

Apley Park, near Shiffnal; Mr. T. Instone, of Collaughton, near Wenlock; Mr. W. Yates, of Grindle, near Shiffnal; Mr. Massie, of Bradley, Corvedale; Mr. H. J. Wilde, The Hay, near Erdington; Mr. A. Gordon, The Hills, Chetton; Messrs. E. Webb and Son, Kinver Hill, near Stourbridge, and several other gentlemen. There was a good competition for the choice ewes, in which class there was a large number. Mrs. Wadlow's ewes sold at from 56s. to 70s.; Mr. Instone's, 56s. to 70s.; Mr. Massie's, 50s. to 60s.; fat wethers fetched from 50s. to 68s. 6d.; fat cows, £15 to £22; cows and calves, £16 to £19 10s.; sows and pigs, £5 to £9. The sale of rams was spirited. Mrs. Wadlow's, 6 gs. to 15 gs.; Mr. Instone's, 10 gs. to 18 gs.; Mr. Yates's, 7 gs. to 16 gs. About 60 rams, 1,000 sheep, and 150 pigs were disposed of, and the sale averaged good prices.

SALE OF HEREFORDS.—At the Herefordshire Agricultural Society's show, Messrs. Edwards and Weaver offered for sale several lots of pedigree Hereford cattle. Among the lots Mr. Wm. Taylor's Tredegar was bought in at 110 gs. The following lots were sold: Livingstone, to Mr. F. Haines, of Mansell, for 36 gs.; Augustus, Mr. George, of Felton, 30 gs.; Bachelor 2nd, Mr. Chas. Davis, of Crumlin, 25 gs.; Sir Oliver 4th, Mr. Thomas Wall, 30½ gs.; The Baronet, Mr. C. T. Hunt, Hereford, 30 gs. Messrs. Pyle and Sunderland also had several consignments, but with the exception of one lot they were all bought in; this was Baron, which fetched 37½ gs.

REVIEW OF THE CORN TRADE DURING THE PAST MONTH.

The eventful weeks of harvest have now been reached and nearly passed with a very variable aspect. The first fortnight of August brought a great deal of rain and uncertainty with it, for much corn was in the fields and waiting to be housed, and some in their hurry were too hasty in this work, as shown in the samples newly thrashed, but the weather then gave signs of improvement, which have since been realised beyond expectation, and brought about a complete change. Prices at first varied with the weather, and tended upwards for old wheat. But on the successful gathering of the new, and its appearance in quantity in the London market, Talavera, which at first was worth 62s., closed, as well as all other sorts, at a decline of 10s., with only a slow sale at the reduction. As to foreign old, there was less depression in prices, for the previous large supplies had brought it much below old English samples, though to sell it freely was difficult at a reduction of 4s. to 5s. per qr.; in fact, a sort of panic was produced, partly by the markets in France, which having for a time risen several shillings above our own, so suddenly and seriously gave way that the best white in Paris fell to 49s. to 50s., and the best flour to 38s. 6d. per sack, while foreign cargoes bought for Havre were reshipped to this country as not wanted. Yet, after all, we believe that neither France nor England can report much, if any, beyond an average crop; but it was a change from the fear of famine rates to those of plenty that brought prices down so seriously. Some of the provincial markets had, indeed, overpassed Paris rates, and on the appearance of new samples of fine quality from the South, and fine weather for the completion of the Northern harvest, the trade perfectly lost heart, and there was a *helter-skelter* *save qui peut*. But bread will be wanted there as well as here; and the last crop, if as good as some believe it to be, is not backed by accumulated stores as in times past, when there was far less excitement and depression. It is true foreign importers begin safely at low prices, and growers can have nothing to fear when there is little room for reduction; and upon this principle we hope they will take courage, and not be unduly depressed, especially as feeding-stuffs keep so relatively dear, that we have heard of Rivett wheat being used for cattle as giving most nourishment for its weight. The following rates were recently quoted at the places named: White Mayenne wheat at Paris 49s., red 45s. to 46s.; Polish at Marseilles 46s. 4d., Ghirka 49s.; new white at Bordeaux 50s.; fine wheat at Courtrai 51s.; old at Louvain 63s., new 53s.; old at Brussels 57s., new 51s.; old wheat at Hambro' 52s.; wheat at Berlin 48s.,

at Mayenne 50s.; best old white at Danzig 57s., new 52s. to 56s.; wheat at Cologne 48s. In Southern Russia prices were declining fast, and were yet unsettled. At San Francisco rates had fallen to 50s. per 500lbs., cost, freight, and insurance; at New York spring red to 37s. 3d. per 480lbs. free on board.

The first Monday being a Bank holiday, we note the market of 31st July instead, which was not included in last month's review. There was but little business passing on that day. The trade opened with a small supply of English wheat, but there was plenty of foreign, and that principally from the United States. Very few fresh samples appeared on the Essex and Kentish stands. Though the weather was unsettled the demand was very slack, and to have forced sales would certainly have lowered the values of home growth. There was less depression in the foreign trade, and some considerable sales were made, at something below the previous Monday's quotations. In cargoes afloat there was very great quietness, but values were little changed. The country wheat trade, being generally very poorly supplied, from the exhaustion of stocks, was little altered, though business was slow and the tendency downwards, excepting where there was bad weather; though at Thirkst there was noted a decline of 2s. to 3s. per qr. Two-pence per cental more was demanded at Liverpool on Tuesday, which stopped business, but a slight rise was confirmed on Friday. At Edinburgh and Leith wheat advanced 1s. per qr., and there was a firmness at Glasgow. Foreign at Dublin was firmly held. Of Irish scarcely anything was shown.

On the second Monday the supply of English wheat was very scanty, but with an abundance of foreign, all from America except about one-fifth. The show of fresh samples on the Essex and Kentish stands was moderate, and nearly all new. The prices asked for red were up to 56s., and those for Talavera 62s.; but to sell it would have been necessary to take about 2s. less, though rain was often falling. The foreign trade was limited, but the values of red for a fortnight back were maintained, though white samples rather gave way. Floating cargoes sold better at 1s. more money. The rain fallen hitherto has not affected the gatherings, excepting in the way of hindrance. The country trade this week was languid and drooping. In spite of very small supplies, some places were 1s. per quarter lower, and others 1s. to 2s., as Sheffield and Rotherham. Liverpool was 1d. dearer per cental on Tuesday, and 1d. more on Friday. Glasgow improved 1s. per quarter, but at Edinburgh there was no alteration. Old maintained its value at Dublin,

and the only new sample exhibited brought 26s. per barrel.

On the third Monday there was an increased English supply, but the foreign arrivals were somewhat less. But few English samples were exhibited this morning, and these were nearly all new. The weather, however, having taken up fire, it was difficult to sell at fully 1s. decline; foreign also manifested a downward tendency, and was an exceedingly slow sale, though nominally quoted as on the previous Monday. Floating cargoes, though held at former rates, were not so ready a sale. The country trade this week tended downwards, and was 1s. to 2s. lower. Wakefield and Exeter were 3s. to 4s. lower, and Liverpool 5d. per cental. Glasgow was dull, Leith and Edinburgh 1s. down, and Dublin 6d. per barrel.

The fourth Monday in London opened with a further increase of the English supply of wheat, and plenty still from foreign ports, about half being from America, with liberal supplies from Australia, India, and the Baltic, and a return cargo from Havre. There was a good show of new English wheat this morning, and, with the finest possible weather for a week past, sales could only be made at a decline of 6s. per qr. both on red and white samples, and that slowly. A reduction in foreign was also noted of 2s. to 3s. per qr., with very little done.

The arrivals into London for four weeks were 10,076 qrs. English wheat, 182,140 qrs. foreign, against 9,462 qrs. English, 246,624 qrs. foreign, for the same period last year. The London exports were 1,368 qrs. Wheat, 1,520 cwt. flour. The London averages commenced at 60s. 3d. and closed at 57s. 9d. The imports into the kingdom for four weeks, ending 15th August, were 3,828,039 cwt. wheat, 127,516 cwt. flour, against 3,829,380 cwt. wheat, 320,080 cwt. flour in 1873. The general averages opened at 60s. 5d. and closed at 58s.

The flour trade has been dull and drooping in consequence of the unsettled aspect of the wheat trade. On the 10th town millers lowered their rates from 54s. to 50s., and on the 24th it was further reduced to 47s., country sorts having fallen from 41s. to 39s., and foreign barrels given way 1s. to 1s. 6d. Extra State had fallen at New York to 21s. 5d. per brl., and flour at Paris had declined to 85s. 6d. per sack.

The London imports for four weeks were 41,809 sacks country sorts, 5,254 sacks 25,079 brls. foreign, against 49,285 sacks country, 21,543 sacks 48,430 brls. foreign in 1873.

There having been large arrivals of maize till the fourth Monday, this grain till then was depressed, at reduced rates—say 32s. 6d. for mixed flat American, and 37s. for round sorts. But rates having fallen below those of the places of growth, the decline seems to have reached its lowest, barley and pulse being relatively dearer. The imports in four weeks were 123,034 qrs., against 61,366 qrs. for the same period in 1873.

The malting season not having commenced, and very little new English barley having yet appeared, business has almost been limited to the sale of grinding qualities, which, from the small foreign supplies, have pretty well kept up their values—say, 32s. to 36s. per qr. New French parcels have been selling at 45s. per qr. and thereabout; but on the last market they were 1s. to 2s. per qr. cheaper, and a small parcel of new English only brought 45s. per qr. The arrivals for four weeks were 359 qrs. British 9,178 qrs. foreign, against 204 qrs. British, 767 qrs. Irish, 26,924 qrs. foreign for 1873.

The malt trade has been very quiet through the month. Some quantity of old yet remaining on hand, holders were more anxious to sell, and prices were looking down, though they have been nominally without change.

The oat trade, with heavy supplies, chiefly from Russia, every week, has fluctuated with the demand, and at the close of the month was about 6d. per qr. lower, Low 35lbs. Russian were worth about 23s. 6d., fresh 38lbs. 25s. 6d., and 40lbs. 28s. per quarter; but, as the bulk of the Russian supplies was now received, there was a possibility of the markets becoming dearer, our own crops being very short, and the stock in granary being comparatively very light. The London imports in four weeks were 677 qrs. English, 910 qrs. Scotch, and 239,928 qrs. foreign, against 1,098 qrs. English, 98 qrs. Irish, and 290,954 qrs. foreign in 1873.

Of English beans the supplies have been unusually small; and though they have been more than made up by foreign, the prices of this grain have been well maintained all through the month, from the constant demand. The new winter sorts that have hitherto come to hand have been remarkably dry and sound, and some small have brought as much as 46s., weighing 66lbs. per bushel. Alexandrian were scarcely worth over 43s., Smyrna and Algerian 44s. Very few as yet seem to be arriving in Egypt, but the fine weather with which the harvest has closed may bring plenty from France and Italy. The arrivals in four weeks were 1,031 qrs. English and 12,575 qrs. foreign, against 1,027 qrs. English and 7,839 qrs. foreign in 1873.

The supplies of English peas have been entirely of new sorts, principally hog feed, of good dry quality; but the yield is considered short. Duns have brought 43s. to 44s., while old white foreign have only been worth 45s. to 46s., so were relatively cheaper. This having brought them into demand for feeding, the prices have been hardening, but since the wheat trade has so gone down, we may find rivet sorts used as a cheaper and more fattening food. The London supplies for four weeks were 1,285 qrs. English, 9,491 qrs. foreign, against 1,027 qrs. English, 7,839 qrs. foreign, in 1873.

Of linseed the receipts have been more liberal, especially from India, but stocks generally being limited, holders have found no necessity to give way in price; all feeding stuffs lately having been relatively dear from the drought. The four weeks' imports into London, were 52,037 qrs., against 37,067 qrs. in 1873.

The seed trade has been generally firm. No heavy seed crop is expected from the clover plant, though we have generally considered a hot August highly favourable, and more may yet be produced than expected; but stocks of over remaining have been too small for speculative purposes, and accounts from France are favourable as to the probable yield. The crop of winter tares has been scanty, and but few have yet been brought to market, and for these high prices were asked, say 10s. 6d. per bush., but, we believe, less would be taken.

PLATE.

W I N T E R - D E - C O T E,

A ROYAL HEREFORD BULL.

Winter-de-Cote (4253), bred by the late Mr. Thomas Edwards, at Wintercote, Leominster, and now the property of his widow, a red with a white face, was calved on August 10th, 1870, and is by Leominster 3rd (3211), out of Pinky 3rd, by Young Grove (2888), her dam Pinky, by Rambler (1046)—Pink 2nd, by Wellington (1113)—Pink, by Stretford (1749).

Leominster 3rd, also bred by the late Mr. Edwards, a red with white face, calved April 22nd, 1868, was by Tomboy (3546), out of Primrose, by Adforton (1839), her dam Gloucester, by Sir Newton (1731)—Red Rose, by Wellington (1113)—Rose, by Stretford (1749). Leominster 3rd was another Royal bull, having taken a first prize as a yearling at the Manchester meeting of the Royal Agricultural Society, as well as other premiums later on.

Pink 3rd, also bred by Mr. Edwards, a red with a white face, was calved on November 1st, 1866, and dropped her first calf, Sir Robert (4131), by Tomboy (3546), in April, 1869; Winter-de-Cote following in 1870.

The first time we encountered Winter-de-Cote was at the Hereford Show, in the autumn of 1872, when he won in the two-year-old class, and we thus wrote of him: "For the best bull in the yard people turned to the two-year-olds, where Mrs. Edwards was first with Winter-de-Cote, the best yearling of last autumn, and hitherto unbeaten; though he has never ventured far from home, his only trials having been at Leominster and Hereford. He is a straight, deep, heavy-fleshed bull,

high-bred in appearance, but with a good masculine stamp about his head and in his general character. The class was a superior one to that at Cardiff, and Winter-de-Cote, if he goes on, threatens to be the best bull of his year."

In 1873, at the Bath and West of England show at Plymouth, Winter-de-Cote was only highly-commended in the aged class, Von Moltke and the Provost being put above him; although we thought that "the Provost would never beat him again." At the Hull Royal Winter-de-Cote took the first prize in the two and three-year-old class, another first in the family class at Hereford, and a similar prize at Leominster.

In 1874 Winter-de-Cote has taken a first prize at the Bath and West of England meeting at Bristol, and a first prize at the Bedford meeting of the Royal Agricultural Society at Bedford, where he "looked to have fed and thrived" only too well. At Hereford Winter-de-Cote was also first when he beat the Provost; but at Dudley he was beaten in turn by old Bachelor, put second to him at Bedford. These are the chief of Winter-de-Cote's performances.

TO THE BINDER.—Through a mistake on the part of the printer during the Editor's absence from town, the wrong plate was used for the September number; the print in which should be *cancelled*, and that of the mare, Comtesse, placed to face the description.

PRACTICAL AND PARLIAMENTARY SENSES.

"In reviewing the past session from a country-side point of view, it is really difficult to surmise what the honourable gentleman will be able to say beyond the fact of his having consistently voted with Blue and White and resolutely opposed Black and Yellow." It was thus that we wrote immediately on the breaking-up of Parliament and since then the honourable gentleman on the country-side has found the simplest possible solution of the difficulty—by saying nothing whatever. For some years past we have week for week during the autumn been able to string together column after column of agricultural table-talk; whereas, so far, during the round of meetings we have had to be content with a few words or so from the chairman, as tacked on to the now fashionable luncheon or more orthodox dinner. The county member has become shy even of "the hazy platitudes of Local-taxation;" and when he has cared to talk, his speech, as we had anticipated, turns on the Labour Question and the good harvest. Not that the honourable gentleman has commonly committed himself to much more than mere congratulation, as far away the most able address of the off-season has been that of Lord Spencer at Northampton on Thursday, which we give in another column. As chairman of a dinner where he was well-supported by farmers he told the meeting that in some parts of the country the agricultural labourer was in a wretched condition, and that "he was not surprised at an endeavour having been made to improve it." He spoke of the great number of empty cottages in many of their large villages, one in his own neighbourhood "having now no less than fifty-two empty cottages," a result consequent on the state of things as brought about by the Law of Settlement, when short-sighted landlords pulled down their cottages wherever they could, and drove the labourer away from his work into the towns and villages. Naturally so vicious a system is coming to correct itself, while there is something very judicial in the manner in which Lord Spencer sums up the case, and his speech is one of the few which will tell with thinking men and really do good.

In the more complimentary effusions from the dinner-table it is noticeable, nevertheless, how very little jubilation has been uttered over the fact that the right Party is now in power. We hear nothing of what Mr. Disraeli's Government did for the farmer during the past session, and not much more of anything which it is likely to do hereafter. It is true, certainly, that when in Warwickshire the other day Mr. Newdegate with a gentleman-like melancholy assured his constituents that "the present Parliament had shown itself more ready to turn its attention in a practical and legislative sense to the requirements of agriculture than any Parliament of late years." Now, of all the nice subtleties of expression, what in the world can this practical sense mean when uttered in a Parliamentary sense? Has the present Government—for this is what it really comes to—shown itself ready to attend to anything which Agriculture has required of it? Has it not, on the contrary, carefully turned away its attention from such agricultural requirements as the extension of Tenant-Right "in a legislative sense," the correction of the Game evil "in a legislative sense," or the repeal of the Malt-tax in any sense? But a fine phrase, surely, is this same "practical sense," and honourable gentlemen are not the only people, as it would appear, who may indulge in it. Thus, in the adjoining county of Stafford, Mr. Masfen ignores the Club and the Office, and even the editor's room, and wants the opinion of practical men on such vital and intricate questions as

whether at a breeding show they should encourage pure blood, or mongrels or animals of doubtful lineage? He would have the judges adhere to the true type, and breeders of sheep who reared from cross-breeds should not be put forward as pioneers. In "a practical sense" we cannot say much for the discussion which followed on this text word. One of the Shorthorn judges, Mr. Robinson, thought very prudently the less he said about his department the better; Mr. Mansell and Mr. Little, two of the sheep judges, never noticed the cross-bred question, and Mr. Evans, a third judge, fairly snuffed it out by saying, all to the point, that "it was no compliment to exhibitors to suppose that they would show cross-bred animals, though of course any man might sometimes make a mistake in purchasing. It might be taken for granted that a man who bred sheep or cattle would do so from animals of the right type and character. That principle would no doubt be recognised by the judges, but perhaps the less that was said on the subject before the show the better." And so it was left to the meeting to make the greatest goose they could by putting two together.

But perhaps the most remarkable feature in these proceedings was ignoring, in "a practical sense," the Club and the Office at the office-dinner of an institution which is a club. The Staffordshire Agricultural Society is as much a club as the Smithfield Club or the Bakewell Club, that is a body of men banded together with a particular purpose, and that purpose a cattle show. Then, again, this was an office dinner, that is, so far as our experience goes, of such officers as judges, stewards, and committee men, where, according to *The Midland Counties Herald*, "the committee do not even carry out their own rules in the selection of judges, but appoint members of their own body in the face of rule 24: *That the judges appointed for general purposes should be wholly unconnected with the Society.*" Speaking in "a practical sense," it would be only wholesome that rules should be either observed or expunged, or the management stultities itself. These Birmingham or Midland strictures, moreover, serve to remind one that as Mr. Masfen is himself a frequent speaker at the meetings of the Midland Club he may have encountered there eloquent gentlemen "whose farming was confined to the office, or the club, or the editor's room," just as Mr. Mechi was wont a long time ago to be reminded of his City offices when speaking at the London Club. But the agricultural world has, to its credit, outgrown any such narrow petty prejudice as this; for in almost every pursuit, that of agriculture included, some of the most marked improvements and advancements have come from the outsider, who has thought out his idea in the office or the library rather than at the plough-tail. It behoves us to say as little as possible of the Editor's room, or of any reforms in the conduct of our Agricultural Societies which may have come from such a quarter; but we may venture to say, speaking in a strictly "practical sense," that an Editor has been invited before now to act as judge at a meeting of this very Staffordshire Society, and that at the office dinner preceding the show, he, like the judges of last week, declined to indicate any special line which he might take when discharging his duties.

Nowhere have the "opinions" and authority of the practical man been more thoroughly upheld than in the columns of this Journal; but we question very much the policy of a farmer by profession going out of his way, as it were, to sneer at people who unfortunately do not happen to unite

the highest intellect with the nicest practice. That such policy did not tell at Tamworth is sufficiently evident, for the discussion provoked after this fashion came to a

ludicrous conclusion; as we may show further, should we care to return to the momentous principles involved in this memorable debate.

THE SICKNESS OF THE SOIL.

The partial failure of the wheat crops for the three last years has led many persons to conclude that the land of England has become sick of such grain, and that it will never recover, except by a protracted fallow; in other words, by laying it down for pasturage, or by resuming the triennial course of husbandry, which consists of two white crops and a fallow. The present year will be enough, one would suppose, to dissipate the idea of sickness of the soil through any other known means than injudicious cultivation, or starvation, by the withholding of manure. There is no doubt that, like working horses or any other animals, hard labour and scanty feeding will have its effect, whether upon sensitive animals or insensible plants, Dr. Hooker's theory notwithstanding, which, literally speaking, gives plants the power of swallowing and digesting their food. If the farmer neglects, or is too poor to cultivate his land in the proper manner, he must expect the certain consequence—a short yield and poor quality, as the inevitable result. This complaint of sickness of the soil is no new one, but the rather very old—say as the Christian Era itself. Did not Columella during the first century write on the subject, in reply to those who just discovered the same mare's nest? He has a whole chapter about it but we shall be content with a paragraph: "It is not, therefore, from weariness, as very many have believed, nor from old age, but indeed from our own slothfulness, that our cultivated lands do not so bountifully answer our expectations as formerly; for we might receive a greater product if the earth were refreshed and cherished with frequent seasonable and moderate stercoration."

Arthur Young, whose opinions were ever founded on facts, made a series of thirty-six experiments of a six-years' course of cropping or rotation, the results of which were published in the 23rd volume of the *Annals of Agriculture* of which he was the sole editor. The experiments were made upon a piece of old pasture of many years' standing, the soil a sandy loam, with a clay-marl subsoil, and his deductions were as follows: That potatoes, as a fallow crop, were more exhausting than any other without plenty of manure, and that barley, beans, and oats succeed better than wheat after potatoes. That beans are the most valuable crop on new land, and that the fertility of such land depends for its continuance greatly on the number of bean crops planted on it, and that the oftener they were grown on it, the better were the succeeding crops of other kinds of produce, and that three successive crops of beans were followed by an extraordinary produce of wheat. He also found that successive crops of white corn are destructive of fertility, and that three such crops will reduce the land to a foul and unprofitable condition. He also ascertained by the experiment that beans and barley alternately, and beans and wheat, also alternately, were the two most productive courses; and lastly, that five crops of beans and one of wheat not only yielded good profit, but left the land in the very best condition. On new land also, as is well known by every farmer of any intelligence, oats are the most profitable crop that can be grown. On the other hand, turnips, cabbages, and potatoes are declared to be the most unprofitable in any course of cropping; and yet, what would the farmers of such light lands as those of Norfolk, Suffolk, and others of the Eastern Counties do without the four-course husbandry? And how could

the supply of animal food be provided without green crops? The number of cattle and sheep kept in Arthur Young's time was much smaller than at present, but the graziers had learned to know the value of green crops, although they were chiefly valuable as substitutes for the bare fallow, and as materials of which, with the help of cattle, manure is manufactured, besides keeping the land clean by hoeing. There is an improvement in this respect, in the value of root and green crops from the increased consumption and enhanced value of fat cattle; indeed, of animals of every kind on the farm, by which the profits of breeding as well as of fattening are rendered more remunerative. A good deal of land has been withdrawn from the cultivation of cereal produce, and laid down in grass, especially in Ireland; but this is quite irrespective of any decadence or diminished fertility of the soil, and is in consequence of the increased value of pasture land and the high price of butcher's meat; but in Ireland specially, from the climate being more adapted, by its dampness, to pasture land and the rearing of cattle than for the cultivation of cereal produce. Ireland shows a decline in breadth of land sown yearly; and whilst meat is dear, and the transit of cattle from abroad difficult, and therefore limited to the nearest countries on the Continent, the acreage in corn crops cannot increase.

Returning to the subject on which we started: Those who are croaking over the alleged decadence of the soil in England will be disappointed this season by the goodness of many grain crops and a partial failure of green and root crops. If the land does not produce what it ought or what it formerly did, this is the fault either of the farmer, who does not bestow the outlay upon it, or that of the landlord who will not allow the tenant to deviate from the stereotyped course of cropping laid down in the lease or agreement. No absolute rules can be laid down for a rotation of crops applicable to all soils or situations. The fact is, that except for the greater convenience of the farmer, a rotation of crops is not absolutely essential to good or profitable farming. By working on scientific principles, for which a large number of the present race of farmers are qualified, they may, without impoverishing the land, grow any crops they please, but the landlord, or rather his factotum, the lawyer, steps in and condemns, very probably, the very course that would both benefit the land and best remunerate the farmer; and thus, half the land of England is only half profitable to any of those parties who possess an interest in it.

SLAUGHTER-HOUSES.—The Cattle Markets' Committee of the Corporation, in view of the approaching compulsory closing of private slaughter-houses in the Metropolis, have been authorised to construct from time to time, as may be required, 20 additional slaughter-houses upon vacant ground on the east side of the Metropolitan Cattle Market in Copenhagen-fields, Islington, contiguous to the Great Northern Railway. The plans have received the approval of the trade, and the new buildings will be replete with every accommodation. The slaughter-houses, when erected, will be let on short leases, and at rents varying according to the size and construction of the buildings, from £130 to £36 a year. The rents in all are estimated to produce about £1,500 a year, or a little over 7 per cent. on the cost of the works.

ON THE BANKS OF THE NILE.

That a vast population once dwelt along the banks of the Nile the numerous remains of the ruins of cities, pyramids, temples, and obelisks sufficiently attest. Even at the present day, with all our experience of great centres where people congregate together, the visitor is astonished at the incomprehensible vastness of these monuments of antiquity. Although many thousands of years have rolled between, whilst Athens, Rome, Peking, Delhi, the deserted cities of Montezuma, may be judged in comparison, yet the immense extent of what was "hundred-gated" Thebes becomes as much a marvel to ourselves as it was to the world in the days of Homer. Were it not for the barbarian acts of man, the propitious climate and the durability of the buildings would have permitted the palaces to be seen and the streets to be trodden in the same conditions as they were by the feet of Moses. The judgment of modern critics has been passed upon the exact position held by Egyptian architecture amongst the other works of the kind, but the engineering methods that must have been brought into existence to accomplish such feats in stonemanship seem to remain unfathomed. With regard to the laws that governed the landed system and the condition of agriculture that would have provided for the multitudes who then lived, worked, and died, somewhat may be gleaned from Holy Writ, somewhat from oenar evidences, and the void must still further be supplied by conjecture. An ingenious and interesting theory has been advanced by M. Barthelemy St. Hilaire, member of the Institute, and one of the learned Frenchmen engaged in the preparatory surveys for the Suez Canal, and this seems to receive confirmation from the state of landed property in Egypt at the present time. The preservation of this tract of land from the surrounding desert depended upon the rise and fall of the Nile, which might well be worshipped as a deity, whose fertilising influence shaped alike the destinies of the nation that lived upon the soil thus created. To retain the waters required a complicated system of irrigation that could not be left to the caprice of individual proprietors; and to the operation of this necessity may be attributed the fact mentioned in the Bible of Joseph having acquired for Pharaoh the whole of the lands of Egypt. The river has never ceased to flow its regular course; and when irrigation has been carried to the highest perfection, the labours of man have obtained the greatest advantages from the bounties of Nature. Thus, ever since the time of Joseph, nearly two thousand years before the Christian era, all claim on the part of individuals to territorial property has been abolished in Egypt. The State is the sole possessor of the soil, and the people have only the usufruct. The Nile therefore, which exercises its beneficent influence, has been the means of creating a despotism that has lasted to the present day.

The soil is so fertile that it seldom requires the plough. Every year, about the summer solstice, at the end of June, from causes still imperfectly known, the river gradually rises in the upper country whence it descends, and continues to swell as it approaches the sea, into which it empties itself. This progressive increase continues for nearly four months, and reaches its height in the middle of October. The river then sinks, as slowly as it has risen, and when, in June, its waters are at the lowest, it begins to rise again as in the preceding year. The periodical recurrence of this phenomenon is itself a great benefit; but the Nile has also two other advantages, no less admirable: it never devastates its shores, and its swollen waters perpetually deposit a mud, which is the

most fertilizing of manures. From the supplies of slime brought down annually, the country has been enabled to bear three, and even four, crops without the least impoverishment. In Lower Egypt sowing commences immediately after the waters subside, the seed only requiring to be strewed over the land, and it either sinks into the soft earth by its own weight, or is trodden down by the cattle driven over it. This is generally done in November: in February the fields are verdant, and in May the harvest takes place. In July rice and maize are again planted, and yield a second harvest in September. In Upper Egypt the constant artificial supply of irrigation required by the land gives to the farmer increasing employment. Deprived of rain and exposed to a burning sun, the land would be arid and barren if not constantly refreshed with moisture. After the water has been preserved in canals and wells, it is raised by Persian water-wheels, worked by oxen, or by means of hand machines of more simple construction. Sowing begins here about November, as in Lower Egypt, and the corn begins to spring up before the end of the month, and by December gives the country the appearance of a verdant spring. In January lupinus, dolicoes, and cumins are cut for the press. By April flax has been ripened, and the plants pulled up; tobacco leaves are gathered, and the wheat-harvest is got in. In July there is a third crop of trefoil and a second of rice. October is the month for all sorts of leguminous seeds to be sown.

In one of the tombs of the Pharaohs there are paintings of the arts and sciences in vogue in Egypt, illustrating probably the predominant features of the reign, and from these we learn that the customs of agriculture have remained unchanged. The *shadoofs*, or machines for drawing water, which are seen at every step on the banks of the river, are precisely the same as those equally rude and clumsy used in ancient times. The plough is still constructed of two simple pieces of wood, seldom furnished with an iron share: there is neither shovel nor wheelbarrow, and the fellows very often remove the earth with their hands, or at most in baskets made of palm-leaves, which they put on their shoulders. The dwellings in the villages and provincial towns are all formed of clay, there being scarcely any wood for building. The sun-baked bricks, of which they are constructed, give them a dull and sombre appearance, which the sun cannot enliven in the narrow streets, built to exclude the heat: they usually consist merely of a ground-floor. Most of them are only an occasional shelter, being inhabited very little during the day, and barely used to sleep in at night. The people have no furniture of any value to lock up; the animals lie on the open ground, like their masters, in a climate where it never rains. The house serves as a shelter for the women only, and infants at the breast. With this indifference to progress, so visible throughout the East, and the use of the most imperfect instruments, there are evidences of incessant toil in the innumerable earth-works, indispensable not only for the great embankments from village to village, and for the canals, but for any cultivation of the fields. To Egypt the subject of the greatest importance is the construction and maintenance of these canals: the more she has of them, the richer she becomes. She possesses neither forests nor mines, which is an immense want, but she has this wonderful stream, capable of supplying many, if not all her wants and deficiencies.

The Viceroy has directed attention to an extended production of cotton, and more recently to the sugar-cane.

The cost of the cultivation, including ploughing and irrigation, is about eight pounds per feddan, or acre, which produces about one hundred pounds weight of sugar. The sugar makers, the refiners, and the engineers at the Viceroy's establishments are all Europeans, and most of them Englishmen. The strange anomaly was witnessed for some time of this country, which has always been the granary of surrounding nations, being transformed into an importer of grain. The oppression of the fellahs, from whom even seed corn is extracted, has been another cause of this falling off. In this land, which from time immemorial has always been dominated by one all-powerful and imperious will, it is not unusual for a village sheikh to be seized and dogged, and even the women have been flogged, to make them give up their jewellery for taxes due by their husbands. Whether much of this tyranny is effected without the direct cognizance of the Government it is difficult to ascertain; but a successful tax-gatherer is considered as sure to obtain favour and promotion. Since 1872 a system of compounding for taxes has been introduced, Government having invited landowners to pay in six years the taxes for twelve years. To those who accept this proposition—and it is considered by the Egyptian landowners as a command—half the

present tax is for ever remitted on their having made six double payments, nor will the tax be subject to future variations. Thus, the owner of land now paying £100 a year will, should he pay £1,200 in six years, receive a title by which he will hold his land for ever, subject to the payment of £50 annually.

There are about 5,450,000 feddans, or acres, of land under cultivation in Egypt, and a feddan that in 1865 was worth £50 might have been purchased since for about £5. The whole of the population is available for agricultural purposes. Were Europeans, who could have redressed against direct oppression, to purchase land and cultivate it scientifically, considerable profits might be made. They would have many annoyances to contend against, but none that an energetic Englishman with the support he would be entitled to claim would not be able by tact, firmness, and patience to overcome. Such is the wonderful fertility of the soil, when fairly treated according to the normal succession of crops and the perfection of the irrigation system when not arbitrarily interfered with for the enriching of certain ground, that a good crop of grass and grain of all kinds can always be expected.

THE IMPLEMENT TRADE AND THE STRIKE.

Whether on the whole the recent agitation has been or is likely to be beneficial to the farm labourer as a body, is an open question, and one to which a decisive reply is hardly warrantable at present; but there can be no doubt that the implement manufacturers have reason to congratulate themselves upon an influx of trade due in great measure to the labour disturbances. As long as labour was plentiful, wages low, and the relationship of employers and employed on a pleasant footing, a large proportion of farmers did not trouble themselves much about labour-saving machinery. There were many reasons for keeping on in the old way, the chief of which was the dislike to discharging men who had served them for years. Then, the use of machinery involves a little extra anxiety and superintendence on the part of the master, as well as an outlay which he is often strangely unwilling to make, although it will be so speedily repaid out of his wages account. In short, the force of habit was entirely in favour of the employment of many men at low wages, and against the increased use of labour-saving machinery. Hundreds of intelligent and well-to-do farmers have hitherto never used a reaping-machine, and declare that they will not use one as long as they can get men enough to do the work at anything like moderate wages. One explanation of this strange fact is, that where the harvest is let to the men to "see it in," that is, by piecework, their prejudice against new machines has prevented them from making due allowance for the assistance afforded to them by the reaping machine; but this is not all. Even where the harvest is let by the month, no machine is used in numbers of instances, although the use of one would effect a saving of at least 10 per cent. on the cost of getting in the crops. The truth is that the farmers of this country require well stirring up before they adopt any new courses, whether in relation to business or to politics, and in this case the stirring has been done by the Labourers' Union.

If the Union gives increased independence to the labourers, it gives it also to the employers; the farmer having long laboured under the serious disadvantage of a feeling of dependence upon a very burdensome obligation—namely, that of finding employment for a larger number of men than were absolutely required. Now that the

men have ruptured the old relations, this obligation is no longer felt, or if still felt, is at least much weakened. Probably it will be best for both parties concerned that it shall be altogether lost sight of, and the relationship of the agricultural labourer to his employer be placed upon a strictly commercial footing. Wherever there is charity there is pauperism, and it was in every way desirable to sever the men from their semi-pauperised position; but the Union leaders were wrong in declaring that the masters should not reduce the number of their workmen. The cultivation of the soil by a minimum of skilled and well-paid workmen using improved machinery is what the best friends of the labourer must look forward to, if they will not blind themselves to the signs of the times. There is nothing more safely to be trusted as a rule than the careful regard of men of business for their own interest. Employers will not be content with few men when they know it would be to their advantage to employ many; and any attempt to induce them from motives of philanthropy to keep on more than they require for the profitable conduct of their business, is a great mistake, and one that is in the long run injurious to all concerned. The consumer not less than the employer or the workman is interested in the economy of the expense of food production. Contrary to the views of those mistaken philanthropists who advocate a system which involves, according to their own representation, a maximum of producers and a maximum of produce, it is the interest of the nation at large that a maximum of produce should be obtained by a minimum of producers. Improved machinery, forced into greater use by the agitation of the labourers, is tending to this result, and in the end all classes may be thereby benefited. It is true that the removal of surplus labourers may be necessary, but as the leaders of the Agricultural Labourers' Union profess to have found their Canaan in Canada, they should be the last to regret even the enforced emigration of the "serfs of the soil" from the land of bondage.

But have we, after all, more farm labourers in the country than might be profitably employed even at increased wages, and with the utmost available use of agricultural machinery, if it were made the interest of every tenant-farmer to do his very best by the land? We be-

lieve not. Surplus and deficiency are relative terms, and the surplus of to-day may easily become the deficiency of to-morrow. To men who dare not farm at their best there is a surplus of labourers in many parts of the country, but with perfect security for tenants' capital the complaint would soon be reversed. The change would, of course, be a work of time, and emigration might still go on in the interval. Not only is the capital of farmers unprotected, but it is unfortunately in many instances deficient. But for any such failing our iniquitous land tenancy laws are in great measure responsible, since through them men are tempted to hire more land than their capital enables them to do justice to, simply because they would not dare to do justice to the small holding instead. With a fair law of Tenant-Right, capital would soon flow to the land, which is everywhere a favourite investment when artificial hindrances are not imposed. After a reasonable time, then, it is probable that, even with the utmost advancement of agricultural mechanism, our present number of agricultural labourers would find ready employment at satisfactory wages, and would no longer be tempted to go where, according to travellers' tales the fust and the mosquito alike bite sharply.

In the absence of the desired incentive to improved farming, who will derive the chief benefit from the economy of labour-saving machinery? Undoubtedly those who have hitherto swallowed nearly all the advantages of agricultural improvement—the landlords. Of

course the increased use of machinery tends in the first instance to keep wages down, and, other things being equal, must always have that effect. But as machinery advances in perfection, its common effect is to stimulate production, and this it will undoubtedly do in agriculture if unfavourable conditions are removed. Then labour will reap its proper share of the advantage derived from the cheaper production of food, and will have reason to bless and not to curse the advancement of mechanical science. But if much work, which is at present done by hand, is in future to be done by machinery, whilst tenant-farmers are still to be left without the security which alone will promote their highest enterprise, what will be the result? Why that they will reduce the number of their men, and that the few who are even then employed will, unless emigration shall be more extensive than we have any reason to expect, have but little command over the wages market. In that case it is easy to see that the economy effected by the machinery will soon chiefly go to increase the rents of our landowners, and neither farmer, labourer, nor consumer will be materially benefited. Such a result could only take place in a branch of enterprise hampered by burdensome and unnatural restrictions. Every one knows what those restrictions are in the case under consideration, but few have yet had their eyes opened to the vastness of the interests involved in their retention or removal.

THE QUEEN'S PLATES—"A MORE USEFUL PURPOSE."

In our report of the last meeting of the Royal Agricultural Society of England, as held upon Bedford race-course, we were enabled to state that the fifty-pound plate which had been given by the Dukes of Bedford for nearly a century had now been withdrawn, and that, as a consequence, the races had fallen through "The course has been turned to other uses, and the Queen's Plate, for which there can be now no call, should be transferred to the horse-ring." Since then the Marquis of Exeter has taken more direct action, and given notice that after this year he "intends to devote Stamford course and stand to more useful purposes," as, "under these circumstances," the race-meeting will be abandoned. No reasonable man can quarrel with the resolution arrived at almost simultaneously by the Duke of Bedford and the Marquis of Exeter. In fact, it has long been a matter of astonishment that country gentlemen of position should continue to give their countenance to that open rascality and utter demoralisation, the now common features of a country race-day. The neighbours, as a rule, carefully keep out of the way, and the full attendance is contributed through special trains, which bring in the scum of London, Manchester, or Birmingham, as the site may suit. And yet noblemen, country squires, and members of Parliament feel it to be "a duty" to subscribe towards such scenes, to suffer their names to appear on the lists of stewards, or even to give over their grounds for purposes which have for some time past become far more typical of a national disgrace than a national sport.

It is only to be hoped that the example which we have cited may be followed by others, and that one of its first effects may be to induce the Government to move. Everybody, including the racing men themselves, sees the absurdity of continuing the custom of offering Royal Plates at these meetings, the competition for which is commonly so small as to preclude even betting on the result. A correspondent of *The Times* has, at length really come to see this, as his letter has supported by

another through the same channel from Mr. S. Sidney, who subscribes himself as "the author of the Book of the Horse," and who states that Corisande won a Queen's Plate by twenty lengths. In point of fact she won by thirty lengths, but the author of "The Horse" is evidently well up in the history of this famous mare, as he also states in "the book" that Corisande won the 2,000 Guineas stakes—for which she did not start—and the Oaks at Epsom—for which she was not placed. But *The Times*, when it touches on outside subjects, does manage to get hold of funny authorities. Still the author of "The Horse" has, in turn, been followed by a man who does know something of that which he is writing about—Mr. W. E. Welby, who says, as to the Royal grants, that "the best use for the money is to be found in the encouragement and improvement of hunter-getting stallions, as from sires of this class spring almost all our best riding, harness, and troop horses. But the difficulty is to know how to make so small a sum (£3,165 for England) at all generally profitable. Distribution of it among local agricultural societies as a subsidy to their prize-lists has been frequently suggested, but to this there are obvious objections. These societies are so numerous, and many of them so nearly on a par, that it would be most invidious, if not impossible, to select from among them, while without such a selection the grant would be simply frittered away in dribbles. Again, many owners of valuable stallions dislike sending them to agricultural shows. The prizes there are generally concentrated on the one or two best horses exhibited, and a man will not send his animal when he knows there will be a better in the show-yard." It is many years since the suggestion for converting Royal racing plates into agricultural show plates was first, that is originally, made through the columns of *The Mark Lane Express*, and, despite Mr. Welby's protest, we adhere to an opinion, which has now found so much favour elsewhere. It is, however, only fair to hear Mr. Welby out, as to what would be better: "Discontinue the Queen's Plates. Let Government

select half-a-dozen of our railway centres—say, *e. g.*, London, Bristol, or Exeter, Birmingham, Manchester, or some other Lancashire town, York, and Peterborough—and at each of these let £500 be given annually in ten equal prizes of £50 each. This would leave £465 for expenses. Let the prizes be for the ten best stallions brought for inspection, which shall fulfil certain specified conditions as to soundness, pedigree, and age, and which shall be at the service of the public at a limited price within a given distance (say 80 or 100 miles) of the town. Let the inspection be held shortly before the commencement of the covering time, and the payment of a premium made contingent on the stallion being available during the ensuing season, to prevent the money being wasted through his going abroad. Let no horse be eligible for more than one prize in a year. Have for judges in each case a cavalry or artillery officer and a civilian, appointed by Government, with competent veterinary assistance; let them attend at each centre on a given day, examine each horse submitted to them separately, and, when all had been examined, award the ten prizes to the ten most worthy competitors, without further classification; and lastly, let the judges be changed every year, so as to avoid all suspicion of prejudice and favouritism. By these means, it seems to me, most of the sound and stout sires in the country would be attracted."

Many of these proposed conditions as to limited service-fees, the prize horses standing in the district and so forth, have of course been offered over and over again, as in truth they are borrowed from the rules of some agricultural societies; whilst Mr. Welby's objections to our plan apply equally to his own. If premiums be offered, and these prove attractive, some of the horses exhibited must be better and some inferior; while we are very confident that the business of judging would be much better done under the control of the agricultural society than if left in the hands of a cavalry officer and a government civilian! One somehow shudders at the very notion. Further, the choice of agricultural societies would *not* be a difficulty, simply because these societies are *not* "nearly on a par;" and the very districts which Mr. Welby cites are already well provided with institutions which might be safely trusted with the distribution of these grants. Thus, "Bristol or Exeter" would naturally fall to the Bath and West of England Society; "Manchester or some other Lancashire town," to the Manchester and Liverpool Society; "York," to the Yorkshire Society; "Peterborough," to the Northamptonshire

Society; and Birmingham to the Midland Counties Society, where the machinery is all ready-made, and where the benefit would be as mutual as direct. In place of London, where such a grant would have very little effect, one of these plates should follow the migratory movement of the Royal Agricultural Society.

There is more weight when Mr. Welby objects to "the risk of exposure for two or three days, or more, to cold, or wet, or burning sun, the fear of accident, and other causes for misgiving," as we are inclined to think that a show of valuable horses should not extend beyond two days; while if you smuggle the awards up in the time during which the cavalry officer and the government civilian are at work, half the effect of the lesson, and half of the winner's advertisement must be lost. The strong line which we would draw should go against any of these plates being put under the control of people who go in for the jumping business—a practice which threatens to eventually disgrace our agricultural meetings as much as gate-money, hurdle-jumping, and light handicaps have our minor race-meetings. Of the Societies we have named the Royal, the West of England, the Birmingham and the Yorkshire do not offer jumping prizes, and others must reform their ways before they can become qualified for stallion plates. The abuse has now grown to be something intolerable; and at the last meeting of the Council of the Royal Agricultural Society of Ireland, Mr. Bagot proposed "That in future shows horse jumping shall commence at four o'clock, and that the only additional charge for admission shall be to the stand." Major Borrowes, in seconding the motion, said he did so in the hope that this was only a step towards the total abolition of jumping at the Society's shows. Sir Allan Walsh said there had been a great falling off in the exhibition of implements at late shows, and he attributed that principally to the prevalence of horse-jumping. Colonel Vesey and several other members stated that they would rather have no show at all than have the horse-jumping continued. Major Borrowes gave notice that at next meeting he would move that after the forthcoming show at Derry no horse-jumping be allowed at the Society's exhibitions; and eventually a Committee was appointed to consider and report on the whole question of horse-jumping.

All this speaks for itself, and if the Irish Society is really desirous of holding its ground as a national institution, it must go with Major Borrowes for the total abolition of jumping at shows.

NORTHAMPTONSHIRE AGRICULTURAL SOCIETY.

MEETING AT NORTHAMPTON.

A certain special interest has come to be attached to the meetings of this Society, as, no question, the open classes of fat stock afford something of a trial for the approaching Christmas shows. Thus, at Kettering last year, the best Shorthorn in Bingley Hall, in 1872, foreshadowed his subsequent failure by taking no prize; while the best of the class had his position there something more than confirmed at Birmingham in two or three months' time, where he was declared to be the champion beast of the Midlands. And of this ox we said, immediately on his being so distinguished, that he "hardly looks like a thorough-bred one, but is simply a great mountain of beef, of not very prime quality, while he begins with a poor, plain, mean head, and has as little style about him as any beast which ever took so high a place; as, what with standing terribly in at his hocks, he is anything but clever from behind." And for

saying so much against the champion we were called to account, perhaps a little too soon, by some "authorities!" The Organ complacently quoted *The Times* on "the grandest beast in the show," and went on to settle the question in a very off-hand manner: "of course the beast is a grand one, or else all the different sets of judges must have been wofully wrong and *The Mark Lane Express* right." And within a few weeks or days of the question being thus settled the Birmingham champion ox was beaten again and again, directly or indirectly, by beasts which he had beaten in Bingley Hall. Moreover, in accordance with a very absurd and pernicious practice, which we have already exposed, Mr. Wortley has kept this animal on for another year, and so at Northampton on Thursday, at five years and some months old, he was brought out once more in the fat ox class. And all we have said of the Midland champion of 'seventy-three we

emphatically say again : he is simply a great or greater mountain of beef, as his size and weight, over twenty-six cwt., now only serve the more to bring out his defects—his lack of breed and style, his poor, mean, common head, and his coarse, faulty thighs and hocks. Naturally he showed signs of having been overdone, and could barely hobble under the burden of his fine broad back, his one redeeming point. We seldom saw a worse show out, and not one of the judges would have him ; taking for first and best a younger and far more comely white, which was only second to the other last year at Oakham, but has since furnished capitally, and with the exception of being a little patchy behind came out very fresh, blooming, and ripe. And with two Shorthorn men in office they even went further, and for second prize selected a pretty, high-bred little Devon, whose want of scale and weight looked almost ludicrous as he braved the leviathans on the Pitychley race-course. The fact of Mr. Senior's beast finishing so forward did not say much for the rest of the class, but spoke more decidedly to the discomfiture of the champion, whose days should be numbered. The best in the younger class of steers was a thick, wealthy three-year-old of quite Mr. Ilowe's type, but standing badly on his feet ; while Mr. Wortley was second with a really nice two-year-old, which so far has a deal more promise about him than the Tidy bargain, his triumphs notwithstanding. Mr. Wells' fat cow had better character, and more beef than the Moss Rose placed before her, and the award was pretty generally regarded as a mistake ; but either of the two capital Shorthorn heifers, which stood first and second in a small class, will be heard of again in better company. Maiden, indeed, has already distinguished herself about home, and Mary Ann alas ! was the best heifer in calf or in milk at the Royal show at Hull and also at the West of England show at Plymouth in 1873.

To look on from the near side, for he has his side, one can still scarcely comprehend how so true, stylish, and *neat*—in the best sense—a bull as Telemachus could this season have ever been put below the white Irwin. With his length and depth, his rich coat, and his placid high-bred "expression," a pupil might study the modern Shorthorn from such a model, the more especially when put side by side with such a foil as Notley, and yet say the judges on the ordeal by touch "that is a useful bull, too." Worthy of the Burghley hero, and, indeed, his only opponent for the extra premium, was Victoria Victrix, looking all the better as more level to the eye from having left her baby, just a week old, behind at Branches. And then there was Telemachus 6th, a far better young bull than they thought him at Bedford, and Telemacina—if there ever could be such a title ; and John Ward leading forth one of his conquering Roses, though soon doomed to be more surprised than satisfied when he saw his high-bred calves actually beaten by a little bit of a Devon. But Roses, reds or roans, will flourish almost anywhere. The Devons finished first once more in a cow class of Shorthorns, against one of Mr. Sharpe's Julias, and so forth, and people began to look on Mr. George Baker, of Luton Hoo, as a very strong man, matched though he might be against Mr. Bowly. There were other classes of more or less merit and interest, of which the prize-list may tell out the story ; though Mr. Clapton Wood supplied but an indifferent advertisement for his coming sale, and Captain Oliver was kind enough to put a chip of the old Dukes into the extra class, just to show the folks what a Shorthorn should be.

The sheep were shown in very mixed classes, and some of the Longwools under the disadvantage of having got wet through in the heavy rain which fell in the Shires on Wednesday. A damp Lincoln is not an agreeable neighbour either to handle or look on, and so Mr. Gunnell's

dripping theaves lost their place. It seemed to us that the different breeds were more confounded than should be at a show of the calibre of the Northamptonshire ; and it might be well if the classes were occasionally more clearly defined. It is not every man who can carry a Devon or Leicester against bigger animals, and Mr. George Turner kept his rams at home, at Thorpeldands. The strongest entry throughout was that of Lincolns, but some of the smartest and most sorry pens in the show were the theaves and lambs sent by Mr. George Street from Maulden, of a really handsome Oxford type, while his brother's entries from Harrwodden were continually labelled as too late for competition, the railway authorities having failed to deliver the sheep in due season. The pig show was short, but with some strong names in the entry ; and here also, as when amongst the sheep, Mr. Treadwell had to do "the best he could" against his Lincolnshire colleagues.

In most places the meeting was a legitimate success, and the horse section, with plenty of competition here and there, opened with a capital class of cart mares, which took a deal of judging, so generally good were the entries ; and an honest half or more appeared to be in it. The two premiums were eventually taken by the same breeder, Mr. Tomlinson, from off the Sutton marsh in Lincolnshire, with a couple of mares which have been continually winning about the country, and for which it is said £400 the pair has been refused. We should rather go for the bay put second, a famous mover in her walk, as we hear that she has beaten the chesnut before now. The cart geldings and fillies ran up to only small entries, but with one or two very good amongst them ; and when we left it looked as if the riding horse business would go on to the end of the week. It was literally riding the horses, as each one of the three judges would get on the same animal, and we should be afraid to say how long it took to appraise a hunter class of some twenty odd entries, in which Marshal MacMahon had placed himself in ten minutes, although it took hours to get so far. It was simply anything for second, and this turned up in a flashy, white-legged chesnut from Husband's Bosworth, although there were better in the class, such as Mr. Whitehead's chesnut, a good third at Bedford, and a winner in Warwickshire the other day. Considering the fuss they made over it, the judging occasionally was very faulty, as amongst the three-year-olds they left out quite a Shire stamp of colt, shown by Lord Spencer and got by Dalesman, but probably "riding purposes" might suit any purpose a judge might turn this to ; although in the very next class, under precisely the same conditions, they put another Dalesman fitly enough first, but if Mr. Kenning's hunting colt had a right to be in, so most assuredly should have been Lord Spencer's entry. And then when the hackneys proper came in the judges threatened to ride everything, and we fairly ran for it, having seldom or ever felt so sick of that noble animal—the horse. The tedium attendant on this sort of thing is becoming insufferable, and would almost warrant the management in going back to judging in private, and having the horses afterwards paraded in public.

It is, however, only fair to say that in consequence of the show coming immediately on the St. Leger the management encountered in turn some fifteen refusals from horse-judges ; while so really good a man as Mr. George Higgins would look to have been only put on at the last moment, as his name does not appear in the catalogue. The sporting farmers, led by Messrs. Drage and Saunders, did credit to the county, although they went mostly for made horses, the younger stock being often indifferent. We do not despair of the jumping being abandoned at a meeting of the repute of the Northamptonshire ; and, as it was, this absurdity was very properly put off, as we have suggested, to the cheap or shilling day,

when of course few or no good horses take part in the performances. It will be seen how, at the dinner, Lord Spencer, a very able chairman, announced that the show in 1875 will be held in Lord Exeter's park at Burleigh, and Stamford stand and course put, as we stated, to "more useful purposes."

PRIZE LIST.

JUDGES.—**BEASTS:** E. Bowly, Siddington, Cirencester; G. W. Baker, Luton; George Bland, Colby, Lincoln. **NAG HORSES:** G. Higgins, Bedford; F. Oldaker, London; G. Hewitt, Draughton, Maidwell. **CART HORSES:** T. Tarnell, Irchester, Wallingborough; F. J. Berry, Stanion; R. Crawley, Melchbourne, Bedford. **SHEEP AND PIGS:** J. Lynn, Stroton, Grantham; E. Howard, Nocton Rise, Lincoln; J. Treadwell, Upper Winchendon. **BUTTER:** J. Hudson, Ludgate Hill, London. **IMPLEMENTS:** J. Craig, Fotheringhay, Oundle; Gilbert Murray, Elvaston, Derby; A. Hughes, Brampton Ash, Market Harboro'. **VETERINARY SURGEON:** T. J. Merrick, Northampton.

C A T T L E.

FAT STOCK.—(Open to all.)

Ox, exceeding three years and three months old on the 1st of December next.—First prize, £10, and a piece of plate value £5, Earl of Lonsdale, Barleythorpe Hall, Oakham; second, £5, T. Lee Senior, Broughton House, Aylesbury. Highly commended, Lord Spencer and E. Wortley.

Steer, not exceeding three years and three months old on the 1st of December next.—First prize, £10, J. How, Broughton, Huntingdon; second, £5, E. Wortley, Ridlington, Uppingham.

Cow of any age.—First prize, £10, O. Beanon, Cresswell, near Stafford; second, £5, W. T. Wells, Withera Hall, Alford, Lincoln.

Heifer, not exceeding four years old on the 1st of December next.—First prize, £10, R. Wright, Nocton Heath, Lincoln; second, £5, O. Viveash, Strensham, Tewkesbury. Commended, T. L. Senior.

BREEDING AND STAKE STOCK.

Bull of any age (open to all England).—First prize, £10, the Marquis of Exeter, Brughley House, Stamford; second, £5, B. S. J. Ackers, Prinknash Park, Painswick. Commended: J. A. Mumford, Brill.

Bull, above two years old.—First prize, £10, T. H. Bland, Dingley Grange, Market Harborough; second, £5, H. Sanders, Brampton Hill, Northampton.

Bull, above one and under two years of age.—First prize, £10, the Marquis of Exeter; second, £5, J. J. Sharp, Broughton, Kettering. Highly commended: T. U. Sartoris.

Extra prize of £5, for the best beast in either the breeding or store stock classes.—The Marquis of Exeter (Telemachus).

Bull calf, above six and under twelve months old.—First prize, £10, J. N. Beasley, Pitsford Hall, Northampton; second, £5, T. Simonds, Carter's Hill, Arborfield.

Cow, in-milk or in-calf.—First prize, £7, T. Lee Senior; second, £3, J. J. Sharp.

Heifer, of any breed, in milk or in-calf, above three and under four years old.—First prize, £7, Lady Emily Pigot, Branches Park, Newmarket; second, £3, Marquis of Exeter.

Heifer, of any breed, in milk or in-calf, above two and under three years old.—First prize, £7, D. Dainty, Belmistorpe, Stamford; second, £3, J. Chaplain, Three Chimneys, Ridwells, Halstead.

Heifer, of any breed, above one and under two years old.—First prize, £7, Lady Emily Pigot; second, £3, G. Underwood, Little Gaddesden, Hemel Hempstead.

Heifer calf, of any breed, under twelve months old.—First prize, £3, T. Lee Senior; second, £2, Marquis of Exeter.

Short-horned heifer, above one and under two years old, to have been in the exhibitor's possession six months previous to the day of show. (Open to the above subscribers, and to all members of the society resident in the county.)—First prize, £10, R. E. Oliver, Sholebrooke Lodge, Towcester; second, £5, J. J. Sharp.

Prize for extra stock, awarded to the Marquis of Northampton.—Alderney bull.

HORSES.

Mare and foal, for hunting purposes.—First prize, £15, S. Middleton, Water Newton, Wansford; second, £5, W. Kenning, Bradden, Towcester. Commended; W. Faulkner,

Rotherthorpe, Northampton; C. W. Scriven, Willea House, Newport Pagnel.

Mare or gelding, five years old and upwards, adapted for hunting purposes (open to all England).—£15, J. Goodliif, Huntingdon; second, £5, J. Snetton, Husbards Bosworth Rugby. Commended: J. Drage, Moulton Lodge, Northampton.

Mare or gelding, above four and under five years old adapted for hunting purposes, bred within the county of Northampton.—£20 and second prizes, J. Drage, Moulton Lodge, Northampton.

Mare or gelding, above four and under five years old, adapted for hunting purposes.—First prize, £10, W. A. Harrison, Oxenden House, Market Harborough; second, R. Horrell, Oakeley Beds. Commended: H. Sanders, Brampton Hill.

Gelding or filly, above three and under four years old, adapted for riding purposes.—First prize, £7, J. Goodliif, Huntingdon; second, £3, J. Wiggins, Market Harborough.

Gelding or filly, above two and under three years old, adapted for riding purposes.—First prize, £7, W. Kenning, Bradden, Towcester; second, £3, J. P. Wright, Priors Marston, Daventry. Commended: J. A. Craven, Whilton Lodge, Daventry.

Gelding or filly, above one and under two years old, adapted for riding purposes.—First prize, £7, W. George, Gayton, Northampton; second, £3, C. Cottrell Dormer, Courteenhall, Northampton. Commended: J. Goodliif, Huntingdon.

Mare, not exceeding 15 hands 1 inch high, with foal at foot, for breeding hackneys.—First prize, £7, W. Catton Branford, Upton, Southsea; second, £3, J. Cooper, Overstone. Commended: W. Linnell, Woodford Grange, Trapton.

Hackney (mare or gelding), not exceeding 15 hands 1 inch high.—First prize, £7, J. G. Franklin, Shutlanger Grove, Towcester; second, £3, Lee Bevan, Brixworth-hall, Northampton. Commended: J. Reeve, The Grange, Newnham, Daventry.

Cob (mare or gelding), not exceeding 14 hands 2 inches high.—First prize, £5, J. Wiggins, Market Harborough; second, £2 10s., J. Marsh, Benefield Lodge, Oundle. Commended: H. Sanders, Brampton-hill, Northampton.

Pony (mare or gelding), not exceeding 13 hands high.—First prize, £3, Captain T. Wetherall, Loddington, Kettering; second, £2, Rev. H. Stobart, Warkton Rectory, Kettering. Commended: J. H. Smith, Hlighcroft Lodge, Oadby, Leicester.

Cart mare, with foal at foot.—First prize, £10, J. Tomlinson, Lutton Marsh, Long Sutton; second, £5, J. Tomlinson. Highly commended: W. Colpman, Naseby Grange, Rugby. Commended: J. Ashby, Mircott, Long Buckley.

Best foal in the class, the foal to be the progeny of the mare suckling the same.—Prize, £5, T. Marchant, Great Easton Park, Leicester. Commended: Captain J. Borlase Tibbits, Barton Seagrave, Kettering.

Cart gelding, above two and under three years old.—First prize, £5, J. Walker, Newnham; second, £2 10s., G. Street, Maulden, Amphyll.

Cart filly, above two and under three years old.—First prize, £5, H. Burgess, Middleton, Rockingham; second, £2 10s., T. H. Vergette, Borough Fen, Peterborough.

Cart gelding, above one and under two years old.—Prize £7 10s. (first and second prizes), R. Timms, Manor House, Braunston, Rugby.

Filly, above one and under two years old.—First prize, £5, T. Messinger, Cold Higham Downs, Towcester; second, £2 10s., G. Stops, Greensnorton, Towcester.

SHEEP.

Ten longwooled ewes that have suckled lambs to the 1st June, 1874.—First prize £7 7s., T. W. D. Harris, Wootton, Northampton; second, £3s. 3s., T. Gunnell, Willow House, Milton, Cambridgeshire.

Five longwooled heaves.—First prize, £5, J. Byron, Kirk Green, Sleaford; second, £2 10s., T. Close, jun., Barnock Villa, Stamford. Highly commended: J. Byron. Commended: T. Gunnell.

Five shortwooled or cross-bred ewes, that have suckled lambs to the 1st of June, 1874.—First prize, £5, C. Barge, Weedon; second, £2 10s., C. Barge.

Five shortwooled or cross-bred heaves.—First prize, £5, G. Street, Maulden, Amphyll, Beds; second, £2 10s., G.

Street. Highly commended: F. Street, Harrowden House, Bedford.

Three shortwooled or cross-bred shearhogs.—First prize, £5, G. Street; second, £2 10s., G. Street. Highly commended: W. G. Duncan, Bradwell House, Stony Stratford.

Three longwooled shearhogs.—First prize, £5, T. Close, jun.; second, £2 10s., T. Gunnell.

Shearing longwooled tup.—First prize, £7, R. Wright, Nockton Heath, Lincoln; second, £3, T. Close, jun. Highly commended: J. Byron. Commended: A. Hlack, Buckminster, Grantham.

Longwooled tup, two-shear and upwards, that has proved himself a stock-getter.—First prize, £7, R. Johnson, Westborough, Grantham.—Prize, £3, R. Wright. Highly commended: R. Wright.

Shearing Down tup, of any distinct breed.—Prize £5, F. Street.

Five long-wooled wether lambs.—First prize, £3, T. Close, jun.; second, £1 10s., T. Gunnell. Highly commended: J. Byron.

Five long-wooled ewe lambs.—First prize, £3, T. Close, jun.; second, £1 10s., J. Byron. Highly commended: T. Gunnell.

Five short-wooled or cross-bred wether lambs.—First prize, £3, G. Street; second, £1 10s., G. Street.

EXTRA SHEEP.—R. Linnell, Moreton Pinkney, Banbury, five shear, bred by the late A. Linnell, Crockwell Farm, Eydou, Banbury.

PIGS.

Boar of the large breed.—First prize, £3, M. Walker, Stockley Park, Anslow; second, £2, R. E. Duckering, Northorpe, Kirton-in-Lindsay.

Boar of the small breed.—First prize, £3, R. E. Duckering; second, £2, S. Deacon, Polebrooke Hall, Oundle. Highly commended: J. Wheeler, Long Compton, Shipston-on-Stour.

Breeding or suckling sow.—First prize, £3, M. Walker; second, £2, R. E. Duckering. Highly commended: M. Walker.

Breeding or suckling sow of a small breed.—First prize, £3, J. Wheeler; second, £2, R. E. Duckering. Highly commended: M. Walker.

Three fat pigs of one litter, of any breed or age.—First prize, £3, M. Walker; second, £2, M. Walker.

Five breeding pigs of one litter.—First prize, £3, M. Walker; second, J. Wheeler.

BUTTER.

Twelve pounds of butter, made up in two pound lumps, wholly or partially the production of Alderney cows.—First prize, £3, W. G. Duncan, Bradwell, Stony Stratford; second, £1, Lieut.-Col. Clarke, Welton Place, Daventry.

Twelve pounds of butter, made up in two pound lumps.—First prize, £3, W. Newitt, Braden, Towcester; second, £1, J. Tew, West Haddon Lodge.

Six pounds of butter, made up in one pound rolls.—First prize, £3, J. Robinson, Courteenhall Lodge, Northampton; second, £1, J. Wareing, Berry Fields, Daventry. Highly commended: W. Everett, Great Doddington, Kettering. Commended: S. Lea, Cransley Lodge, Kettering.

IMPLEMENTS.

A silver medal to Ball and Son, Rothwell, for collection of implements; and the Society's medal for waggons and carts.

The Society's medal for Coult's improved press for corn-drill, exhibited by Ball and Son.

A silver medal to Smith and Grace, of Thrapston, for their improved steerage horse-hoes.

A silver medal to W. Smith, Kettering, for his turnip thinners.

A silver medal for Barford and Perkin's steam tackle and elevator.

The Society's medal to G. Lewis and Son, Kettering, for their improved sack elevator and shooter.

The Society's medal to Marshall, Sons, and Co., Gainsborough, for improvement in engine and thrashing machine.

The Society's medal to Hlaves and Son, Stamford and Peterborough, for market cart.

Very highly commended, A. Hughes, Brampton Ash, Market Harborough, for patent laid corn-lifter attached to Samuelson's reaper.

Highly commended: Whitwell's patent warming and ventilating fire grate.

Commended: Burdick's self-delivery reaper, and Kirby's mower and reaper, exhibited by D. M. Osborne and Co., Fox-street, Liverpool.

The Society's medal to H. Smith, Midland Carriage Works, Northampton, for Stanhope wagonette.

At the dinner, Sir RAINALD KNIGHTLEY, M.P., was glad to find that they had not been much troubled with the labour movement which they had all been watching with the greatest interest. He was very glad the struggle had terminated as it did. It was perfectly right that the poor man should endeavour to obtain the best price he could for his labour; but if they had persons living at a distance and knowing nothing at all about the districts coming amongst them and dictating to the farmers what wages they should pay, it would be utterly impossible for farming to be carried on; the greater part of the land would have to be laid down in grass, and only a certain number of labourers—a very few—could be employed; and as these few would be the best men the others would have no resource but to go to the union. He did not want to see landlords deprived of their rents, farmers of their profits, or the deserving labourer obliged to go to the workhouse. The question then was what was the best way of meeting the difficulty, as it would inevitably crop up again some time or other. What had been resorted to in the Eastern counties was a perfectly legitimate mode of warfare; the lock-out was the only means of protection the employer had against the strike. Both, however, were harsh and objectionable measures, which should be resorted to as little as possible; and the best way to avoid those measures was to endeavour to make the labourers as comfortable as possible. The best means of doing this was by letting them have comfortable, well-drained, and well-ventilated cottages, with allotments let at a moderate rent—this, however, was a landlord's question—and by the establishment of coal and book clubs as counteracting influences to the attractions of the public-houses; while it was the duty of all those amongst them to employ the intellect and means with which they had been blessed for the amelioration of the condition of their less fortunate fellow-men.

Mr. PICKERING PHIPPS, M.P., said the interest of the town and country were not all divided, and one of the very best things for agriculturists was that they now obtained comparatively high prices in consequence of the beef-consuming and bread-consuming power of the artisans in towns being increased by the prosperity of trade. All classes of which this country consisted had an interest in each other's welfare; and the greatest enemy to be found in this country, in which all ought to be striving to do their duty to the Queen and constitution—the greatest curse was the man who went about striving to set class against class. The union had been tried and had failed, but there were two other kinds of unions—one which they should try to keep out of, the union workhouse, and the other which he should wish all to try and maintain, the union of good fellowship and kindly feeling. So long as the interests of the large centres of commerce were prosperous, so long would agriculturists be prosperous. But they must take care that their local burdens were not allowed to increase. He was quite sure that real property in this country—the land and houses—bore quite as much as it ought to do of the share of taxation, and he was glad to find that allowances had recently been made from the Consolidated Fund for some purposes formerly looked upon as local, but now recognised as imperial.

Lord SPENCER, the chairman, regretfully alluded to the removal from amongst them, he was afraid on account of his health, of Mr. Owen Wallis, and to the recent death of Mr. John Beasley, who, not only as an agriculturist set them an excellent example in high farming, but who was at all times ready to give them the assistance of his valuable and wise counsels. He felt that he could to-day congratulate the Society on the success of its meeting. What they wished to do by means of these societies was to give the highest possible examples of what good stock and horses should be, and also to show the most recent and useful inventions in the way of agricultural implements. In both these particulars they found as good examples in their showyards that day as could be found in the whole of England. They had in Telemachus an animal of which the county ought to be proud—an animal who had travelled about England almost as much as the young

hero, from whom he got his name, travelled about the Grecian seas. And he understood that he had brought to his noble owner nearly £1,000 in prizes. They could not have a nobler example of what stock should be than in Telemachus. So in the horse classes, they had had splendid specimens of what horses should be; whilst implements for ploughing, carting, and other agricultural operations had been fully represented. When they saw the increasing space which was taken up by the implements it led them to reflect what a great change was taking place in the culture of land—in the mode in which it was cultivated, and in the population who lived on our soil. Seeing how much agricultural machinery was lessening the necessity for human labour, that their own observation supported by the results of the last census indicated that there were fewer men engaged in the cultivation of the soil than there were ten years ago. Another indication of this was to be found in the large number of empty cottages in many of their large villages—a large village in his neighbourhood having no less than fifty-two empty cottages, which a few years ago were full of tenants. Though this was partly to be accounted for by the use of labour-saving machinery, yet there was another cause, and one upon which he thought they might congratulate themselves. The farmers and occupiers of the land were most anxious to get their labourers as close to their work as possible. Some years ago there were many places with hardly a single cottage on the farms, and the labourers had to go a great way to their work, and a great waste of power was the result. This had been largely obviated by the erection of cottages on the close parish, and the open parish had lost many of its inhabitants. It was a great advantage to the farmer; and it was an advantage and an additional comfort to the labourer, not only to find himself nearer to his work, but with a better house, and probably at a much cheaper rent. What became of a large class who used to remain in our parishes, often to fall into idleness, and eventually on the poor-rates? Most of them he thought, went to the towns, and there got assistance in the shape of employment from commerce and trade, to which the member for Northampton had referred in such sensible terms. This was a great advantage, but it pointed to the importance of their giving, as far as possible, a good education to the labouring classes. With steam cultivation and the employment of agricultural machinery in other operations of the farm, they would need more education and intelligence in their labourers. And as to what he might call the surplus labour, that, if educated, would be enabled to gain an independent livelihood in the towns. They would see a yet greater increase in machinery, and a greater need for an intelligent and educated class of labourers. The result of recent changes had been to make a certain class of our labouring classes not satisfied with the lot in which they lived. He was

not referring to this county, for here, as a rule, the agricultural population were in a satisfactory position. The labourers, as a rule, were well housed, and the farmers had met the demand for increased wages with liberality. No one would deny that in some parts of the country the agricultural labourer was in a wretched condition; and he was not surprised that an endeavour should be made to improve his position by combination. No one would deny that the agricultural labourer had a full right to combine; and in dealing with these matters, as Sir Rainald Knightley had justly observed, they should try to use the utmost forbearance and moderation. With regard to the strike and lock-out in the Eastern Counties, one side took matters with too high a hand, and were hardly justified in the demand they made. But still, on the other hand, extreme demands were made. A useful lesson would perhaps be learnt by both sides. Each party would see that the other could combine, and that in dealing with each other there should be the utmost forbearance and moderation. If they did this throughout the country he thought they would get rid of this difficulty of agricultural strikes. It was a necessary consequence of a popular movement that some men who joined it would use intemperate and violent language; but they ought not to repudiate a whole movement on that account. Looking over some recent Government returns, he observed that there were more allotments in Northamptonshire than in any other county in England, save one—namely, the county of Leicester. There was a per-centage of 6·78 of the whole of the allotments in England to be found in Northamptonshire, the per-centage in Leicestershire being 7. He attached great importance to this, because, although a labourer might not get much from his allotment, yet it gave him an amount of self-respect and independence which he would not otherwise have. If they by such means led their labourers to be self-dependent, and to rely on their own exertions, they would be less liable to become the victims of agitators who went about the country, and more likely to be reasonable with their employers. He believed that at this moment there was considerable prosperity amongst the agricultural classes of England. He believed they would find, when the returns were published this year, that there were more lands under corn crops than last year, and that the head of stock had greatly increased. He was sure they would receive the announcement with enthusiasm, and very heartily acknowledge the liberality of Lord Exeter—that as the Agricultural Society held its next year's show in Burghley Park, he desired to give certain special prizes. The prizes were exceedingly handsome and would do much to attract from all parts of England the best stock to compete for them. The noble marquis would offer a £100 prize for the best bull in the yard; £50 for the best cow; and £30 for the best pen of sheep. He added that if Telemachus were successful to-day—as he had been—he would give a further prize for the labourers.

WARWICKSHIRE AGRICULTURAL SOCIETY.

MEETING AT KNOWLE.

The entries of cattle were sixty-seven animals, against forty-three of last year; and these were generally useful, but without any of great repute. The Shorthorns took the leading place, and the Longhorns the second; the Herefords, though prizes were offered for them, being entirely absent. In the class for Shorthorn bulls over three years old, of five entered the two best were Puck and Earl of Warwickshire, both bred by Mr. H. J. Sheldon, of Brailes, but exhibited, the one by Mr. R. Penson, and the other by Mr. J. W. Wilson. The judges differed as to which was the better bull, and Mr. Lynn was called in, and the premium was awarded to Mr. Wortley's fancy, appropriately enough here, as a Warwickshire noble. For two-year-olds Mr. Ackers took the first prize with Cymbeline. In the Shorthorn bulls over 10 and under 20 months, the first prize was awarded to Mr. J. J. Sharp, of Kettering; and for the second, Mr. Robotham, who took second at Tamworth, was beaten by Earl Beauchamp with Robin Adair. The next three classes were those for Shorthorn cows and heifers, and

among the exhibitors was Mr. Owen Benion, of Cresswell, Stafford, whose cow, which was disqualified, as it is not in milk; and Mr. Sharp took the first prize, the second going to Mr. W. B. Gibbins, of Eatonington. The class for heifers under three years old, in milk or in calf, was poorly filled. The best was Mr. B. St. John Acker's Queen of the Georgians, which took first prize at the Worcestershire show. The seven heifers under two years old were better, Mr. Ackers taking the first prize with Lady Carew, and Mr. J. J. Sharp second. The only remaining Shorthorn class was that in which entries could be made to compete for the prizes of £22 and £7 offered by the local committee for the best Shorthorn bulls from any place in the kingdom, introduced into or bred in the neighbourhood, of not more than ten miles from the show, and to be kept for the use of tenant farmers in the district, at a price not exceeding £1 ls. per cow during the succeeding twelve months. There were only three competitors, and the prize was awarded to a red-and-white three-year-old, bred and exhibited by Mr. Thos. Walker,

of Berkswell. Six animals were exhibited in the three Longhorn classes, of which four were the property of Mr. S. Forest of Kenilworth, and Mr. John Godfrey, of Wigston Parva. The entry chiefly served to show that the breed is now falling away even in the Midland Counties. The pairs of cows for dairy purposes ran to six entries, and the first-prize pair was that exhibited by Earl Beauchamp, and the second by Mr. J. Dugdale, both being good. There was a class for pairs of dairy cows belonging to tenant farmers residing in the county, but the animals exhibited were of little merit.

The show of sheep, as of cattle, was larger than last year. Mr. G. Turner, of Thorpeldans, sent in some of his Leicesters, and took the three first and three second prizes. The Cotswolds, a breed seldom found on farms in this district, was represented by Messrs. Raynbird and Wheeler; while Mr. T. W. D. Harris, of Wootton, Northampton, took the prizes which were offered for "other" longwools. The Shropshires, as at all shows in the Midlands, were the principal feature in the sheep department; and the first prizes in the principal classes were set down to Mr. H. J. Sheldon, Mr. W. Baker, and Mrs. Sarah Beach. Mr. F. Street, of Bedford, was the only exhibitor of Oxfores, but with some very good specimens of the breed.

In several classes the number of entries of pigs was small. In class for boars of large breed Mr. Hicken, of Dunchurch, took first prize, and Mr. Matthew Walker second. Small-breed boars were scantily-filled classes; but in the Berkshire boar class the competition was keen, the show being large, and the quality of the animals high class, Mr. Heber Humfrey, of Shrivenham, Berks, sending a number. In breeding sows Mr. Hicken again won, as did Mr. Humfrey with Berkshires.

The show of horses was but moderate. In the mare-with-foal class there were several animals which would have been better away. There was only one entry in the cart gelding class above four years old, and although the committee offered a handsome prize for a pair of agricultural draught horses, there was no entry whatever. The hunters' classes filled much better, and there were some promising things amongst the four-year-olds. There were several weight-carrying hunters, Mr. Goodliff, of Huntingdon, taking the prize of £40 with Marshal McMahon. The mares were an uneven class, and there was a great falling off noticeable. Hacks were fairly good, and there was a good show of ponies.

PRIZE LIST.

JUDGES.—**CATTLE:** T. Morris, Maisemore Court, Gloucester; E. Wortley, Ridlington, Uppingham. **AGRICULTURAL HORSES:** T. Rush, Chalk Farm, Babraham; S. Burchnall, Cutton, Burton-upon-Trent. **HUNTERS, HACKS, PONIES,** &c.: Col. Luttrell, Badgworth Court, Axbridge, Somerset; H. J. Thurnall, Royston. **SHEEP AND PIGS:** J. Lynn, Church Farm, Stroton, Grantham; T. Horton, Harnage Grange, Salop. **IMPLEMENTS:** J. A. Beale, Brockhurst, Lutterworth. **CHEESE:** P. Jacks, Leamington.

CATTLE.

SHORTHORNS.

Bull, above three years old.—Prize, £10, J. Wilson Wilson, Broadway. Highly commended: R. Peason, Chipping Norton.

Bull, over twenty months and under three years old.—First prize, £10, B. St. J. Ackers, Painswick; second, £5, T. H. Bland, Dingley Grange.

Bull, over ten and under twenty months old.—First prize, £5, J. J. Sharp, Kettering; second, £4, Earl Beauchamp, Madresfield Court.

Cow, in milk, above three years old.—First prize, £6, J. J. Sharp; second, W. B. Gibbons, Eatington, Stratford-on-Avon.

Heifer, under three years old, in milk or in calf.—First prize, £6, B. St. J. Ackers; second, £3, A. Robotham, Oak Farm, Drayton Bassett. Highly commended: Earl Beauchamp.

Heifer, under two years old.—First prize, £6, B. St. J. Ackers; second, £3, J. J. Sharp. Highly commended: J. A. Mumford, Thame.

Bull, provided for the use of tenant-farmers within ten miles of the show, at a price not exceeding £1 ls. per cow, during the succeeding twelvemonths.—First prize, £22, T. Walker, Berkswell Hall; second, £2, with £5 added, J. Dugdale, Wroxall Abbey (Bismarek).

LONGHORNS.

Bull.—Prize, £5, J. Godfrey, Wigston Parva (Royal Charlie).

Cow or heifer, in milk.—First prize, £5, J. Godfrey (Fairy); second, £3, S. Forrest, The Chase, Kenilworth.

Bull, for breeding purposes, of any pure breed.—Prize, £3, W. A. Battine, Eathorpe Hall (Alderney).

DAIRY CATTLE.

Pair of cows in milk, which have been used in the exhibitor's dairy for the last two seasons.—First prize, £10, Earl Beauchamp; second, £5, J. Dugdale.

Pair of dairy cows in milk, belonging to a tenant farmer residing in the county.—First prize, £7, J. F. Packwood; second, T. Satchwell, Hearnfield, Knowle.

EXTRA STOCK.

Highly commended.—J. Dugdale (two Shorthorn calves).

SHEEP.

LEICESTERS.

Shearling ram.—First prize, £6, and second, £3, G. Turner, jun., Thorpeldans, Northampton.

Two-shear rams.—First prize, £6, and second, £3, G. Turner, jun.

Five shearling ewes.—First prize, £5, and second, £2, G. Turner, jun.

COTSWOLDS.

Shearling ram.—First prize, £5, and second, £3, H. E. Raynbird, Basingstoke.

Two-shear ram.—First prize, £6, H. E. Raynbird; second, £3, J. Wheeler, Long Compton. Highly commended: H. E. Raynbird.

Five shearling ewes.—No entry.

OTHER LONG-WOOLLED SHEEP.

Shearling ram.—First prize, £5, and second, £3, T. W. D. Harris, Wootton, Northampton.

Five shearling ewes.—First prize, £5, T. W. D. Harris.

SHROPSHIRES.

Shearling ram.—First prize, £6, H. J. Sheldon, Brailes House, Warwickshire; second, £3, S. C. Pilgrim, Hinckley. Highly commended: S. C. Pilgrim.

Two-shear ram.—First prize, £6, W. Baker, Moor Barnes, Atherstone; second, £3, S. C. Pilgrim. Highly commended: B. Long, Middleton.

Five shearling ewes.—First prize, £5, Mrs. Sarah Beach, Penkridge; second, £2, S. Wilkes, Brewers' Oak Farm, Shiffnal.

OTHER SHORT-WOOLLED SHEEP.

Shearling ram.—First prize, £5, F. Street, Harrowden House, near Bedford.

Five shearling ewes.—First prize, £5, F. Street; second not awarded.

Tup, the property of a member, and to be used this season in the county.—Prize, £2, E. Lythall, Radford Hall.

EXTRA STOCK.

Highly commended: H. E. Raynbird.

PIGS.

Boar of the large breed (except Berkshire), under 18 months old.—First prize, £3, J. Hicken, Dunchurch; second, £2, M. Walker, Stockley Park, Anslow.

Boar of the large breed (except Berkshire), above 18 months old.—First prize, £3, C. Benson, Grove Farm, Knowle; second, M. Walker.

Boar of the small breed, under 18 months old.—First prize, £3, M. Walker; second, £2, J. Wheeler, Long Compton.

Boar of the small breed, above 18 months old.—First prize, £3, M. Walker; second, £2, J. Wheeler.

Boar of the Berkshire breed, under 18 months old.—First prize, £3, H. Humfrey, Kingstone Farm, Shrivenham; second, £2, M. Walker.

Boar of the Berkshire breed, above 18 months old.—First prize, £3, J. Spence, Villiers Hall; second, £2, G. C. Greenway, Ashorne.

Breeding sow, suckling pigs of her own farrow, and in milk, of the large breed (except Berkshire).—First prize, £3, J. Hicken, Dunchurch; second, £2, C. Benson, Grove Farm, Knowle.

Breeding sow of the small breed, suckling pigs of her own farrow, and in milk.—Only one entry; prize withheld.

Berkshire sow, suckling pigs of her own farrow, and in milk.—First prize, £3 and second, £2, H. Humfrey.

Three breeding pigs of one farrow of 1874, of large breed.—First prize, £2, M. Walker.

Three breeding pigs of one farrow of 1874, of small breed.—Only one entry; prize withheld.

Three breeding pigs of one farrow of 1874, of Berkshire breed.—First prize, £2, H. Humfrey.

Sow of any breed suckling pigs of her own farrow, and in milk.—First prize, £2, J. Hicken.

HORSES.

AGRICULTURAL.

Stallion.—First prize, £15, T. Statter, Stand Hall, Whitfield, Manchester; second, £5, Messrs. Yeomans, Four Ashes, Wolverhampton. Highly commended: T. Tagg, Newhall, Barton-on-Trent.

Mare, with foal at foot.—First prize, £10, W. Hulston, Ditchford Friary, Moreton-in-the-Marsh; second, £5, S. Abbotts, Arley Hall, Coventry. Highly commended: T. Russell, Lower Shuckborough.

Gelding, under three years old.—First prize, £5, and highly commended, C. Barton, Temple Balsall.

Filly, under three years old.—First prize, £5, S. Davis, Woolashill, Pershore. Highly commended: W. Baker, Atherstone.

Cart gelding, above four years old, regularly worked.—First prize, £5, T. T. Burman, Hockley Heath.

Cart mare, above four years old, regularly worked.—First prize, £5, J. Dugdale, Wixhall Abbey. Highly commended: R. Timms, Braunstone.

Pair of agricultural draught horses, regularly worked, the property of a tenant farmer, residing within ten miles of the show.—No entry.

HUNTERS.

Stallion adapted for hunting purposes.—First prize, £15, R. Hutton, Portman-square, London.

Hunter ridden during the past season with the Warwickshire, Atherstone, Pytchley, Bicester, Quorn, Lord Coventry's, Heythorp, or Cotswold hounds.—First and second prizes, £15 and £5, W. Whitehead, Woolaston, Wellingborough. Commended: A. Robertson, Banbury.

Hunter, four years old and upwards.—First prize, £15, J. Hicken, Dunchurch; second, L. Riley, The Outwoods, Meriden.

Weight-carrying hunter.—First prize, £40, J. Goodliff, Huntingdon. Highly commended: R. Hutton, London.

Mare, best calculated to produce weight-carrying hunters, the property of a Warwickshire farmer.—First prize, £40, J. E. Bennett, Bosworth Grange, Rugby. Commended: H. Green, Hatton.

Four-year-old gelding or filly, adapted for hunting purposes, the property of a tenant farmer residing within the limits of the Warwickshire or North Warwickshire hunts.—First prize, W. Mann, Brookhampton.

Half-bred two-year-old colt or filly, the property of and bred by a member.—First prize, £3, J. Griffin, Burton. Highly commended: W. Tyler, Birmingham.

Mare best calculated to breed hunters, with foal at foot, the property of a member of the Society.—First prize, £5, T. Watson, Whitacre.

Weight-carrier, equal to no less than 15 stone, the property of a Warwickshire farmer, and that has been hunted during the past season.—First prize, £5, L. Riley, Meriden.

Hunter, hunted during the past season, the property of a tenant farmer.—Only one entry. No award made.

HACKNEYS AND PONIES.

Hackney, exceeding fifteen hands.—First prize, £10, W. T. Stanley, Leamington.

Hackney, not exceeding fifteen hands.—First prize, £10, Major Quentin, Woodleigh, Cheltenham.

Pony, above thirteen and not exceeding fourteen hands.—First prize, £5, W. S. Cooper, Hilmorton Paddock, Rugby.

Pony, above twelve and not exceeding thirteen hands.—First prize, £5, W. Tyler, Birmingham.

At the dinner Lord LEIGH thought with the Earl of Yarmouth that the department for horses was a weak part of the show, but he hoped that exhibitions in future years would be more successful in that respect. He was pleased to learn that there had been more competitors for the cottagers' prizes this year. It had often been said, and with justice, that it was most important that the labouring classes should have their cottages improved. He had visited that day some cottages in that neighbourhood which were setting a good example, and he was glad to see that the cottages generally throughout the country were being improved. But while they were building new cottages, he did think that it was important to give every encouragement they possibly could to make the labourers themselves know how to make those cottages comfortable. He knew from his experience that many cottages well built were miserably kept, and therefore he thought that encouragement given to cottagers to keep their houses and gardens neat and tidy was a step in the right direction.

Mr. MUNTZ, the chairman, said, in regard to the proposal which was made to amalgamate that Society with others, he could not see sufficient reason for it. He thought it would not be creditable to that Society to do so. There were many parts of the county that they had not visited. He was a believer in the usefulness of such societies as that, the primary object of which was the education of agriculturists, and as there were parts of the county which had not been visited, he thought that the work of the Society was not complete. They had felt the need in that neighbourhood of such a Society. They had a small local society, and by bringing the county society there they should accomplish greater good than they had done. One of the great objects of the Society was to establish competition, which was an excellent means of improvement and of gaining information. He only hoped that what was now done in Knowle would be repeated in other parts of the county which had not experienced the advantages resulting from a visit of the Society. Several gentlemen had expressed to him the opinion that the Society had done its work, and was getting antiquated, and that it would not go on much longer; but if they would only put their shoulders to the wheel the Warwickshire Society would not die, and he hoped it would live much longer than he should. He was in favour of a meeting of the associated societies of the counties, and no one would be a greater supporter of such a meeting than he, but he should, at the same time, like every county to maintain its own independence.

Mr. C. N. NEWDEGATE, M.P., felt that in the presidency of Mr. Muntz that day they had a union of all opinions in the cause of agriculture, which boded well for the success of that association, and it was creditable to the temper of good old Warwickshire. The agricultural interests had been exposed to storms, as they all knew, during the last four years. Social difficulties—that was, difficulties between employers and employed—he believed were passing away, thanks to the steadiness, the good temper of all classes employed in agriculture. There was an agitation, justifiable at first, but which some intended to urge beyond the legitimate objects of that movement. Those engaged in that agitation began by doing some good, but he thought they had shown that they meant mischief. The effect of that had been to draw closer together the landlords and tenants. He believed also that the effect of this movement was this—that the agricultural labourers, who were induced to believe that there were ready cultivated Edens open for them in foreign lands, had learnt that, though they were free to leave the country, still the homes they would find abroad were some of them colder, some of them hotter, and some of them less enjoyable than the homes they would leave behind. It rested with the landlords and tenants to improve that feeling amongst their employes, and he recommended them to consult with those whom they did employ. If they expected intelligent service they must consult with their labourers. They would be disappointed if they failed in intelligence, and how could they give to them intelligence but by conveying to them their own. Let this feeling pervade the agriculture of the country, any the difficulties that they had passed through would be for their good. In conclusion, the present Parliament had shown itself more ready to turn its attention in a practical and legislative sense to the requirements of agriculture than any Parliament of late years.

Mr. H. J. SHELDON referred to the system of over-feeding. He dare not, himself, at one of these exhibitions, show any animal above eighteen months old; as he could not afford to feed up an animal worth £500, and not make him worth a £10 note. If that system were amended, instead of thirty or forty beasts being exhibited, there would be 500. A man could not be expected to be preparing an animal for a show for twelve or eighteen months, and then not be any use after-

wards. As a practical man, he could not refrain from making these remarks.

Mr. T. HORLEX, jun., had been sorry to see the way in which the horses were worked. If any officers of the Society for the Prevention of Cruelty to Animals had been present, they might have objected. With regard to the relations between employers and employed, the farmers owed a debt of gratitude to the noble-hearted men in the Eastern Counties.

STAFFORDSHIRE AGRICULTURAL SOCIETY.

MEETING AT TAMWORTH.

The cattle numbered seventy-four entries, and consist of Shorthorn; but the strength of the meeting is in the Shropshire sheep classes, which, however, are so restricted by the regulations that the best breeders are unable to compete in many instances, and therefore several classes must not be taken as containing first-class specimens of the breed. It is time, says *The Midland Counties' Herald*, several of these regulations were expunged, as we observe that the committee do not even carry out their own rules in the selection of the judges, but appoint members of their own body in the face of the following, Rule 24: "That the judges appointed for general purposes shall be wholly unconnected with the Society." In the class for aged bulls the prizes were awarded to Hindoo Chief, a very promising two-year-old of Lord Shrewsbury, and to a large-framed white bull Duke, bred by one of the judges, and owned by Mr. F. Stanier Broade. For yearling bulls, Bloomfield, the property of Mr. A. S. Hill, M.P., was first, and Mr. A. Robotham's Red Rover second, the last named being purchased at the Bingley Hall sale in the spring, whence many other prize winners in the yard were obtained. In a large class of bull-calves Mr. A. Robotham was placed first, and Major Webb second with a calf of the Gwynne family. Mr. A. Robotham was again to the fore in the cow class, as the breeder of Miss Bloomer, the three-year-old shown by Mr. F. Cartwright, and also as the owner of the second-prize cow, Eleanor. In two-year-old heifers Mr. Wolfertan was successful, and Mr. A. Robotham completed his list of honours by winning in the yearling heifer class with a pair of reds of his own breeding. In the classes for cattle for dairy purposes, Mr. Joseph Bickford, of Moseley Hall, Bushbury, was the most prominent competitor. Mr. F. Cartwright's red Shorthorn heifer won as a fat beast, and also as the best Shorthorn in the yard, though closely pressed by Moss Rose, a frequent winner. Mr. Harcourt Griffin's two-shear Shropshire ram was first, and next to him Mr. S. C. Pilgrim's ram of the same age. Mr. Pilgrim also won with a shearling ram, beating a sheep of Mrs. Beach's, which obtained honours at Bedford, where Mr. Pilgrim's ram was unnoticed, one of the two judges acting on both occasions. Mr. Charles Byrd won with ram lambs, Mrs. Beach with ewes, Mr. Pilgrim with theaves, Mrs. Beach with ewe lambs, and Mr. Owen with wethers; Mr. Coxon taking second for ewe lambs, and the other seconds for ewes and theaves going to Messrs. Thomas and Charles Smith, from the neighbourhood of Ashborne. There was a good entry in the classes for 20 ewes and theaves, for the former of which Mr. Thos. Wood was first, Mr. T. F. Cheate second, and Mr. R. Wyatt, third; and for theaves Mr. H. Lowe was first, Mr. W. Tidy second, and Mr. T. F. Cheate third; but it is quite possible that the awards in these two classes may be altered, as there were several protests talked of on account of the peculiar conditions under which the prizes were offered. The long-woolled sheep comprised three cross-bred

Lincolns and Leicesters, from Mr. Robert Johnson, of Kirkireton, who farms these prizes.

The pig classes were short in number of entries, and Mr. Matthew Walker's pigs carried off every prize for large and small white breeds and Berkshires to Stockley Park, with the exception of two second prizes for Berkshires, which go to the Earl of Shrewsbury. There are just under 100 entries of horses in 14 classes, the competition being fair except for Suffolk stallions, which the Earl of Shrewsbury vainly tries to introduce to the district; and the Clydesdale Young Lofty was once more first in the All-England class. The Earl of Lichfield is a successful exhibitor of working cart horses, and Mr. W. W. Riddell sends the best mare and foal. The nag horses were mainly from the immediate district.

The implement trials were a failure, only a few ploughs, and a horse rake, and a haymaking machine, being entered, and of the ploughs not one was worked by steam. The only exhibitors of ploughs were Barnes, who showed implements made by Ball and Sons, Howard, and Ransome, Sims, and Head; and Perkins, who exhibited ploughs of his own make. Prizes were given to Mr. Barnes for Howard's and Ransome's ploughs, and to Mr. Perkins for those of his own make.

JUDGES.—SHORTHORNS AND FAT STOCK: W. Nevett, Yorton, Shrewsbury; J. Robinson, Clifton, Olney. SHROPSHIRE SHEEP: T. Mansell, Ercall, Wellington; J. Evans, Ullington, Shrewsbury. DAIRY CATTLE, LONG-WOOLLED SHEEP AND PIGS: E. Little, Lanhill, Chippenham; W. Tomlinson, Bradley, Ashbourne. AGRICULTURAL HORSES: J. Belcher, Moreton, Gnosall; W. Power, Brancote, Stafford. NAG HORSES: C. Randell, Chadbury, Evesham; C. Milward, Moseley, Birmingham. CHEESE AND BUTTER: H. Smith, Wyastone, Ashborne; J. Swain, Leicester. CORN: J. H. Masfen, Tamworth. IMPLEMENTS: J. J. Rowley, Western Bank, Sheffield; R. Craven, Uttoxeter. ROOTS: R. H. Masfen, Pendeford.

At the judges' dinner, Mr. R. H. MASFEN said, what he wanted was the opinion not of men whose farming was confined to the office, or the club, or the editor's room, but of practical men, and he would like to hear from the latter how stock was to be kept during the coming winter; and if there were any gentlemen present who were in favour of rearing stock from cross-breeds, he would like to hear their reasons for preferring that plan to the use of pure-blooded animals. For his own part he hoped that the judges would stick to true type, and not award prizes to mongrels or to animals of doubtful lineage. He was interested in knowing whether there was any gentleman who would have the boldness to get up and say that cross-breeds or mongrels produced superior animals to those which came from pure-breeds. He was in favour of rearing from pure-breeds in the case of Shorthorns, and he hoped nothing would be done to encourage those breeders of sheep who put themselves forward as pioneers, but who reared from cross-breeds. It would also interest the company to know the views of Mr. Rowley and Mr. Craven with regard to the progress made by inventors and manufacturers of implements. It would, too, be in Mr. Hewitt's power to give them some very valuable informa-

tion with regard to poultry, and more especially with regard to breeding. If he did not mistake, Mr. Hewitt once told him at Market Drayton that a goose from two pure-breeds weighed twice as much as a goose got by cross-breeding. If that was true with regard to geese, it might also be true with regard to cattle and sheep, or to any other class of animals. For breeding purposes let the stock have as pure blood as it was possible to get. Cross-breeds might have great weight, but it should not be forgotten that they were great consumers.

Mr. ROWLEY claimed for the department of implements as great importance as attached to the stock classes. He was not prepared to endorse all the remarks of Mr. Masfen, for he did not think it was advisable to confine breeding for a series of years to one kind of animal. It was a very important matter to assimilate animals to soil and climate, for great failures sometimes followed the removal of animals from one district to another, especially if the districts were distant from each other. Close breeding was of less importance than assimilation to soil and climate. The question, "What were they to do with their stock during the coming winter?" was one which it was very difficult to answer. "Give them plenty of cake." He would like to ask whether there was any gentleman present who could speak from experience with regard to the use of the liquid manure-drill this dry season. He knew of one farmer in Oxfordshire who had this season used that drill with results so satisfactory that he had determined always to use it and never to use the dry drill again. He was also able to speak from his own experience with regard to the value of the liquid manure drill in raising turnip crops in dry seasons.

Mr. ROBINSON thought that as he was a judge the less he said about his department the better.

Mr. MANSSELL said Mr. Lowe had told them to give their cattle plenty of cake, but how could that be made to pay with cake at £13 15s. a ton? (Mr. E. LOWE: You can get it at £13 delivered.) The question was, "What was wheat worth?" With wheat selling at £10 a ton, how could they afford to pay £13 for cake? No; the best thing to do would be to mix wheat with cake and oat straw and other things, and feed the animals with it. Let treacle and water be poured over the wheat, and a capital food would be made for the winter; but it was absurd to suppose that farmers could at the present time afford to pay £13 a ton for cake. He trusted that other gentlemen present would take up this subject.

Mr. LITTLE said he had not sown turnips for the last fifteen years without using the liquid manure drill, and during the whole of that time until the present year he had not lost a "plant." This year they had no rain in his part of the country from the 9th of April to the 10th of July, and the consequence was that the plant was attacked by the fly and then by the green aphid. He had some turnips which were as good as could be shown, but they were not a "plant." It was usual for him to begin about the middle of May and go on until about this time. He could show a regular "plant" over the whole of his farm, but the black grub and the dry weather had been great enemies. The rough wind of Sunday week blew the plant by hundreds into heaps, and it was found that the grub had eaten them through excepting a small portion of the heart. Every man who grew turnips should have a liquid manure drill, with a well or pond, a pump, and all proper appliances. He endorsed all that Mr. Mansell had said with regard to using up their own produce as food for stock during the ensuing winter. With wheat at £2 a quarter, they could have nothing cheaper, and in fact there were some inferior qualities, like the Rivett, which could be bought for less than £2 a quarter. When boiled, wheat made a very fine manure, and when mixed with oat-straw and hay it would make an excellent food, and save the growing of extra turnips. If they could only tide over the winter they might depend upon being able to get a good price for their stock. Every pound would be wanted to feed the population, and even if they had to go to a little extra expense some means must be devised for keeping the animals. They must make the most of every bit of hay and straw that they had.

Mr. MANSSELL feared that coal was too dear to permit of the boiling of wheat.

Mr. EVANS thought that the end would be gained by soaking the grain for 24 hours.

Mr. LITTLE thought not; it was desirable that the wheat should be made into furmety.

Mr. EVANS thought it no compliment to exhibitors to suppose that they would show cross-bred animals, though of course any man might sometimes make a mistake in purchasing. It might be taken for granted that a man who bred sheep or cattle would do so from animals of the right type and character. That principle would no doubt be recognised by the judges, but perhaps the less that was said on the subject before the show the better. He trusted that all the exhibitors would be satisfied. Of course those who won would be content, and he trusted that those who were unsuccessful would resolve, like true Englishmen, to win another year.

Mr. JOHNSON said they heard a good deal about modern breeds, but 25 or 30 years ago they used to rear animals which at this day would take a good deal of beating—a right good, honest, sound type of sheep, with good features and plenty of wool and mutton, and with a hardy constitution. They were sheep upon whose backs you might have jumped to ride. In that neighbourhood they had made the mistake of selling all the best ewes and taking the inferior animals for breeding.

Mr. TOMLINSON said he would be the last in the world to deprecate good breed, but he must say, as a dairy farmer, that you could not make cheese without milk, and it was frequently found that the more blood the less milk. He wished to impress upon breeders that it was of importance to dairy farmers that they should have milk-yielding animals as well as true shape and quality. Dairy farmers must have cows which give milk for eight or nine months in the year and not three or four months. He could not help thinking that of late, while they had cows of good breed, they had been deficient as milkers, and he supposed this was to be attributed to the fact that cows used for breeding had not good firm udders and had not been accustomed to give milk for eight or nine months out of the twelve. There would be more satisfaction in purchasing pure Shorthorns if they could only give plenty of milk.

Mr. NEVITT said breeders must be very particular in the choice of the bull if they wanted to get good milkers.

Mr. HEWITT said many persons made the mistake of buying fancy poultry which had been kept up in small pens and were not of strong constitution, and turning them out on to large bleak farms, expecting they would do as well as fowls which received careful attention from regular exhibitors. The fact was that an ordinary farmer could not grow show poultry and make it pay. They sometimes read of fowls fetching £3 10s. a pair, but how many pairs were sold at that price? When fowls were very high-bred they did not lay anything like so many eggs as birds less distinguished. For the use of the table simply there was nothing better than to get two first-rate birds of two breeds and cross them. As to geese, he thought there was no more useful bird for a working man with a family than the much-abused goose. If they took an Empden gander and a Toulouse goose, they would get a very much larger bird than by other parents; but if they took a Toulouse gander and an Empden goose, the birds would be three or four pounds heavier than with the sexes reversed. The Empden was white with blue eyes, and the Toulouse was a grey bird; when crossed they produce a saddle-backed bird with a little brown on the thighs, the geese weighing 15lbs., and the Ganders ranging from 18lbs. to 26lbs. If, however, they were to breed next year from the produce of the cross, the birds would not weigh more than 7lbs. or 8lbs., which was a wonderful fact. One great advantage in the case of geese could not be passed over: they lived to a greater age than almost any other bird. He once knew a goose which positively lived on the side of the same common for 42 years. Her mistress was ill upon a sofa, and the old bird laid her eggs at the foot of the sofa, and hatched two goslings when she was 42 years old. As a poultry judge the bird was placed before him, and he guessed it was about a quarter of that age. The wisest plan in breeding turkeys was to get the largest-framed hen possible, and it did not matter if the cock was not so large so long as it was strong and lively. It was well known that a turkey which weighed 25 or 30 pounds was worth more than four turkeys of half that weight, because almost any price could be got for birds exceptionally heavy. If farmers would breed from Dorkings and Bramahs and then kill off they would have as good a fowl as possible for their purpose. Game was undoubtedly the best for the table; and the best time to kill the pullets, if they wanted a luxury, was just before they lay. When a game fowl was reared with proper attention to the framework it carried more flesh than any other kind. For

eggs they would cross game and Malay, and then they would have eggs more like those of a guinea fowl than anything else. He repeated that if farmers tried to breed fancy poultry on bleak lands without the care and coddling which they got from exhibitors they would get neither prizes nor profit.

Mr. E. LOWE said the only legitimate cross for the table must have game on one side or the other. He had proved this fifty times. No rule could be laid down with regard to the keeping of fowls in exposed places. He once took with golden-pencilled Hamburgs all the prizes which could be obtained by

one man, and the birds never roosted anywhere but under a hedge in a bleak field.

Mr. MANSELL: It is quite clear there are no foxes in your country.

Mr. HEWITT thought Mr. Lowe had misapprehended him. He said that if fancy birds were taken from a place where they had been coddled up, and were turned on to a bleak farm, they would be of no service; but if the eggs were bought and the chickens were acclimatised they would do more good.

THE RUMOURED REFORM OF THE GAME-LAWS.

TO THE EDITOR OF THE MARK LANE EXPRESS.

SIR,—Remembering that many of the members of the present landlord administration, and the great majority of its supporters in Parliament—thanks to the tenant-farmers of England—are game-preservers, and having due regard to the rumour which is afloat, that it is contemplated by Disraeli and Co., in the next session, to legislate upon the game question, it is pertinent, I think, to ask, through your columns, How is such a ministry, backed up as it is by such supporters, likely to deal with such an important subject? And before the question is answered, it is to be hoped that many of your readers will well consider (1) what the Game-laws are, and (2) what they are accountable for.

Of this there cannot be a doubt, namely, that these laws are of feudal origin, and still retain a feudal character. By the common law of England game is the property of the occupier. But then comes in the operation of what the landlords of England call "free contracts;" and under these very *precious* "free contracts" the occupier is universally coerced into contracting over to his landlord his lawful right to possess the game. The game is thus "freely contracted" over to one who knows no better wisdom seemingly than to oppress if not to "kill the hen which lays the golden eggs," and who, judging by actual facts, does not think that he has any interest whatever in keeping game within reasonable bounds, or his tenants from being despoiled by it; and if the enforcing of such contracts for such purposes means anything, it means simply the exercising of a power which is unreasoning, reckless, imperious, arbitrary, and entirely feudal in its nature.

In the second place, the Game-laws, when taken in connection with the preservation or over-preservation of this form of vermin upon the occupier's crops, and in despite of his consent, are a serious tax upon the said occupier, and, by the human food which is partly destroyed and partly consumed by the referred-to vermin, ultimately a serious tax upon the consumer—in other words, upon the nation. This tax, too, is imposed in the face of the fact that foreign food to the annual amount of some £140,000,000 sterling, which is virtually an impoverishment of Great Britain to that amount, requires to be imported to supplement the inadequate supplies annually grown at home. By all this a sample is shown of what our Farmers' Friends and "old nobility" are capable of, for sake of self-indulgence, or of what they term "sport"—that is, sport at such a sacrifice pecuniarily, at the expense of so much destruction to the tenants' crops and to the people's food! In days of yore, when "he took who had the power, and when he kept who could," the feudal lord openly levied what was then called black-mail and what was really a plunder tax upon his inferiors. This was long ago declared to be oppressive and illegal, and as such put down by Government by force. Under, the preservation of game system, however, what is virtually the same thing as was the levying

of black-mail has been revived, and he who at the present day either preserves game upon his tenants' crops, through means of an *enforced* contract, or receives a game-rent of his farms in addition to an agricultural rent, is doing neither more nor less than levying black-mail upon his tenants and inferiors under another name.

And, in the third place, the Game-laws are carried out at the expense of a violation and suspension of the British Constitution, inasmuch as by the Game-laws Amendment Act, commonly known as Sir Baldwin Leighton's Act (certainly it was not the Act of the majority of the British people), any ordinary policeman, on the merest suspicion, or even in the gratification of private malice, is empowered, of his own accord, to seize upon and to search any of her Majesty's subjects on the highway. He requires no magisterial warrant or authority whatever for doing so. Such is a part of the Game-laws, such an Act is the insolence of a class, and such is the Christianity, or the flunkeyism, or the moral cowardice of the people, or whatever else the supineness may be called, that the said insolence has been hitherto quietly, calmly, and tamely submitted to! It is under these circumstances, be it remembered, that the present landlord Ministry, with the aid of their game-preserving majority in Parliament, propose to reform the Game-laws! and it is hoped and supposed by the said landlords and game-preservers that the British lion will neither "roar nor lash his tail" under the *infliction* of the sort of game-law reform which need only be expected from such legislators—legislators, as already said, returned as their representatives by the highly-educated and intelligent body of English tenant-farmers.

The above, however short it may fall of the whole truth, is a description of what the Game-laws are. With your kindly permission I will, in a future letter, endeavour to describe what these iniquitous laws are accountable for.

Your obedient servant,

THOMAS ROBERTSON.

Narragmore, Athy, Sept. 16th.

THE NORFOLK COUNTY SCHOOL.—The pile of buildings erected at Elmham has just been opened for the accommodation of 300 boys. The style of architecture adopted is described as Old English Domestic. The buildings are substantial and commodious, but there is little, if any, superfluous ornament, and the contract price of £8,000, for which the erection of the entire structure was undertaken, has not been exceeded. The exterior of the building is of red brick, with flint dressings, and with large dormers at intervals. All the timber work, externally and internally, is stained and varnished. There is a hall on the ground floor where a distribution of prizes was made by the Rev. J. L. Brereton.

THE IMPEDIMENT TO AGRICULTURAL IMPROVEMENT.

TO THE EDITOR OF THE MARK LANE EXPRESS.

SIR,—We are a loyal people, not given to sudden changes, but strongly attached to old customs, which is a safe and proper desire within certain limits; but we resisted the introduction of railways, and most of our great towns repented when too late; we smashed up the first power-looms, spinning jennies, and thrashing machines; and it took us thirty years to make us believe in the potato. Jethro Tull's drill and horse hoe required half a century, and the Rev. Patrick Bell's reaping machine quite as long, before it was partially used, and even now the reaping machines are by no means general. The steam plough is working its way slowly, but it will require at least another century before town sewage and human voidances are appreciated and utilised. The hedge-row system and roaming at large of animals, and the attachment to plenty of poor permanent pasture, slowly give way to arable land and a more profitable practice. My neighbours took twenty odd years to believe in the iron fold hurdle on wheels, instead of cheap wooden ones, and it will be fifty years before a fixed engine will be considered indispensable on every arable farm of 200 acres.

Landowners, tenants, and labourers participate in this loyal attachment to old things and old practices, but it is a sad bar to rapid advance. We want more food, much more home-grown food, so as to keep our money at home, and our people employed in producing it. This, I know from thirty years of observation and practical experience, can only be done by giving up some of our ancient but now unprofitable agricultural attachments.

I frequently converse with landowners and land agents who are desirous to improve land, but the great difficulty is to get tenants willing to pay a fair interest for such improvements, and invest the necessary increased tenant's acreable capital. On the other hand, intelligent wealthy farmers lament that their landlords cannot or will not make the necessary landowners' improvements, or give, by lease, a valuation for such improvements when made by the tenant at his own cost. In backward districts there is an unfortunate satisfaction with things as they are, and a want of belief in modern agricultural innovations. In such a case it becomes necessary for the landowner gradually to lead the way, and also to exercise a mild despotism as the late admirable Mr. Coke did. Twenty-seven years ago the late Sir Robert Peel expressed to me his difficulties in this respect, and why he could not suddenly "convert" certain tenants. When the itinerating meetings of the Royal Agricultural Society found their way to benighted but very self-satisfied districts, how it astounded the natives to see the old plough worth £5 superseded by Fowler's £2,000 plough, and the old flail represented by a £450 thrashing machine; as the song said, "What an alteration!" Liebig in his *Modern Agriculture*, p. 198, gives an amusing instance of strong prejudice when red clover was first introduced into Germany: "The Birkenfeld peasants of last century grievously complained that Government wanted to compel them to cultivate a foreign weed (clover). They told the officers in the plainest terms 'to stick to their lasts,' and concern themselves about things they had learned. As for husbandry, they (the peasants) were likely to know much more about it than all the margraves and overseers in the world. They did not wish to give the matter a single trial, and when ultimately compelled to sow the clover, they demanded, after a time, a magisterial inspection of the fields, and showed 'that not a leaf of the clover had come up.' And no wonder, for it turned out at last that the peasants had boiled the seed before putting it in the ground. In our day scientific principles are treated

somewhat in a similar manner, the professors of modern agriculture boil them in their pot, and it is then openly shown that not a grain has come up."

Many do not know that at one time—before the introduction of clover, root crops, and oilcake—we had no roast beef at Christmas; for, as soon as the grass failed, the fattened beasts were killed to prevent their becoming lean, and were then salted. The past history of agriculture is interesting as showing how gradually we have become civilised, and also points to still further changes than have yet taken place. I am, therefore, justified in foreseeing the time when we "clever" people of the present shall be looked back upon as "the lights of other days."

I am a believer in improved agricultural education combining theory with practice. It will dispel much of the fog of doubt and disbelief. The intelligent farmers who have emanated from the Royal Agricultural College at Cirencester, afford ample evidence that the multiplication of such institutions in every county of Britain would be of vast benefit and encouragement to a more enlightened and more profitable use of the soil. Our landowners would be none the worse for an education in modern agricultural principles. They would then, concurrently with their tenants, adapt their fields, roads, and buildings to the modern requirements of the steam plough, the covered yards, and the modern sheepfold, which render hedgerows and trees unnecessary.

The evidences of non-education are painful, and nationally disgraceful. None of my men of 50 can read or write. When two of Fowler's great ploughing engines came on to my farm last week, and brought their "house," in which four men and a boy reside, I offered them newspapers to interest them in their leisure hours, but none of them could read, except the boy! That made a deep and painful impression upon my mind, and I said to myself, "Ignorance cannot be bliss."

Two farmers in my neighbourhood (one deceased) could neither read nor write, though successful men. The education movement has come none too soon, for it is the general education of the American people that has, in the brief period of their independence, enabled them to excel by far in enterprise, and equal in wealth, their British parents; but then they have more than 120,000 public schools and colleges, &c., and 132 agricultural colleges to our poor "one." Each agricultural college has a farm of 400 acres attached to it. The American people and their Legislatures are keenly alive to the importance of education in its relation to the business of life.

Not quite so with us, for I have heard many a wealthy farmer say that education would spoil his best men. The Americans have 67,000 miles of railway against our 16,000.

I am quite aware that I have been, and perhaps am now, considered by my "practical" brother farmers "a torment" to agriculture, never letting old things alone, and disquieting the agricultural mind; but so strong is my conviction of the necessity for progress in the art of filling the British stomach (the most important of all the arts), that the short period still allotted to me shall, D.V., be a continuance of my determination in the good cause of *Frugibus vita alitur*, which is the motto on my armorial bearings at the Herald's College, believing that my efforts are for the good of my country and of my brother agriculturists.

Yours,

Tiptree, August.

J. J. MECHI.

BUSINESS HOURS AND BUSINESS HABITS.

TO THE EDITOR OF THE MARK LANE EXPRESS.

STR,—Why do so few well-educated city young men turn to agricultural pursuits as a business? and those country-born turn from their fields, and find their way to city and town, to office and warehouse? Is it because these are more inviting than the sweet fresh valleys and bracing hills? Scarcely so, for the summer holiday is anticipated with pleasure because of the opportunity to get away from the smoke and din. Is not the reason to be found in the fact that, as a class, farmers and corn and flour factors are not so business-like in hours and mode, but conduct their affairs in a muddling old-world style, particularly irksome to those who possess the faculties of promptitude and method? I speak more particularly of buying and selling as conducted amongst the middle-class country traders. To illustrate my meaning I will give an instance which I witnessed. A farmer had some wheat for sale, and called on a neighbouring factor with the sample: time, soon after dinner. Well, he made various remarks on weather, markets, and so forth, discussed at some length the mode of his neighbours' farming, how many times a certain field had been used for a certain produce in so many years, which was "altogether wrong;" then the manner of fattening his cattle was brought forward, but not a word about the wheat. He was asked to take refreshment, and decanters were introduced; after which he was increasingly eloquent upon what "ought to be done" by others. Well, I thought, how long is this to last? The afternoon sped on. At length the sample was produced, and much praised; but no price asked. His customer was asked "what he would give for such a fine lot?" and of course the figure did not suit. Some perfectly irrelevant subject was started, which occupied his reasoning powers till nearly five o'clock; then came, "Well, shall I send in the wheat?" "Oh, not at that price;" he objected, and thought and thought again, shook hands, walked to the end of the premises, and in another fifteen or twenty

minutes decided to take the price. Three hours over one transaction! and this is not by any means unusual.

Another objection to the country mode is people coming on business are brought into the family room. Now, there are many persons who meet us often in business whom *we* cannot take as friends, and would not wish our wives or sisters to; why then intrude upon them, at any hour, men—possibly plainly evidencing a recent visit to cowshed or piggery—whom they cannot be pleased to associate with? Their city cousins are not subjected to such annoyances, and their expressions of dislike doubtless influence the young men to choose a different profession.

There should be neutral ground for business transactions. Every mill and farm should have an office, so as not to disturb that sweetest blessing of home—privacy, without which home is but a name. Much discomfiture is often brought upon a family where there is no provision of the kind.

A tradesman has his shop, the accountant his office, and so on, and certain hours. When closed, the public know that they must wait for re-opening; but in the country at any hour from 6a.m. to 10p.m. the miller, at least, must be open to his customers' calls. And, in consequence of the style of doing business already noticed, the family are also deprived of the privilege of feeling free from intrusion, which sometimes is most inconvenient. Many feel this, and take steps to have it different; but it is regarded almost as an absurdity, and they are esteemed as being above their business; something, as the old Scotch gude wife considered her neighbour who had taken to clean her house, "So ower proud to want her floor clean soopit; na such fash in the gude old days."

But our business-like young people wish for a better mode of doing things, and if they cannot succeed at home they will try elsewhere, leaving many who are unable to wish they could do likewise. Yours,

A MILLER'S WIFE.

AUSTRALIAN WINES.

It is not very probable that the wines of France, Spain, and the Rhine will be surpassed, or even equalled by any competitors, near or remote; but however ample the resources of existing vineyards, it is certain they cannot keep pace with the constantly-increasing demand produced by the rapid growth of our wealth and its accompanying habits of luxury. An opportunity has been afforded at the International Exhibition, held at Kensington, for the growers throughout the world to enter into competition; and in addition to the wine from the wine countries *par excellence*, the public have been enabled to form an acquaintance with the vintages of Italy, Hungary, Greece, Sicily, Australia, and even America. This collection possesses considerable interest, for it has not been possible hitherto to bring together such a variety as may be seen in the limited space afforded by the cellars of the Albert Hall. The older wine countries of Europe have up to quite a recent period produced all the wine consumed in England, and the advantages attached to the sale of such undoubtedly excellent products has retarded the introduction of any less known or favoured. There is enough, however, in this exhibition to show that no speciality of climate and soil exists, and when viticulture shall have become sufficiently established elsewhere, the monopoly

enjoyed by them at the present time will not remain altogether unchallenged.

The success of the samples of Australian wines that have been tested at Vienna, and again in the British metropolis, has encouraged the belief amongst the colonists of Australia in the capabilities of their country to produce a good drinkable wine. By competent judges, who have made it their business to traverse all the principal wine districts of Europe, it is asserted that in Australia many millions of acres may be found, which, from their situation, as regards climate, aspect, and soil, are especially adapted for the culture of the grape. Superior advantages may be derived from the seasons, which are not so uncertain as in Europe, whilst the fruit obtained is equal to any in the world; and with experience in the different niceties during the manufacture, it is confidently anticipated that an article can be produced that will be in no way behind many of the productions of Europe. The progress of the vine since its introduction is worthy of attention, as it may hereafter form an important element in the material resources of Australia, already so rich in mineral, vegetable, and animal products.

The first vine was planted in the valley of the Murray by German settlers, who were struck by the resemblance

in the locality to their own native Rhineland, and the success attending this first attempt led to the whole of the hills and slopes around being transformed from rough wild bush into blooming vineyards, orchards, and gardens. The example of the Germans was followed by British settlers in this part of the colony, and an industry unknown twenty years ago now extends over a distance of one hundred and fifty miles along the banks of the Murray River, yielding abundant crops, and producing various wines known in the market as "Murray wines." From this original stock cuttings were transferred to Victoria, whilst in South Australia certain other enterprising settlers were introducing the varieties of plants derived from the wine districts of Spain, Portugal, and France, accompanied by foreign labour to superintend their growth. Both as regards variety of stock and of locality the vine, therefore, has been tolerably widely diffused, and only awaits the encouragement of the public to make it a substantial and remunerative industry, as in every probability it will hereafter become. Under the disadvantages attached to a modern culture in an article that has been matured in the greatest possible perfection in Europe, even at the present time the wines of Australia, comparatively speaking, show much promise. In character some closely resemble the Rhenish, while others approximate more to the finer description of white Portugal, and the old wines of the Rhine. Amongst the grapes that have been found by experience to produce the best white wines are the Riesling, which, although not a large bearer, is always a hardy vine, and the fruit is less liable to damage from wet before vintage than other kinds. The Verdelho that produces a fine bouquet, the Aucarot, the Chasselas, a hardy plant, and the Pedro Ximenes. Amongst the red varieties preference is given to the Shiraz, Maalbec, Carbinet, Burgundy, and Roussillon.

The difficulties attending the first cultivation of the vine were far greater than in the case of any other natural product. There were difficulties in the choice of the soil, the kind of grape, the mode of planting, the making of the wine, its treatment and transport; and it must be borne in mind that although the colonies possess every variety of climate and soil obtainable in any of the wine producing countries, yet they have not been fully tested or even reviewed as to their capabilities. The vines best suited to each locality are yet by no means clearly ascertained, and the system of making wine must for some time longer be experimental. The earliest introduction of the vine took place about the year 1850, and statistics show that South Australia in 1871 possessed 6,131 acres of well-established vineyards under culture, in which 5,783,674 vines were bearing and 385,084 unbearing, and from which 801,694

gallons of wine were produced, and 8,584 cwt. of grapes sold. Next in order was Victoria, which had in 1872 5,523 acres under cultivation, in which were planted 9,671,292 vines, producing 713,609 gallons of wine and 30,896 cwt. of grapes. In the same year New South Wales possessed 4,152 acres, producing 413,321 gallons and 508 tons of grapes sold, besides 607 acres of vines unproductive. The whole extent of land occupied by the vine exceeds therefore 16,000 acres, and the production nearly approaches two million gallons. At the outset the prejudice in Australia against the home-grown wines was very great; but the consumption, which is principally colonial, has increased to such an extent that the article has a prominent place in every household, and far exceeds the ordinary imported wine. By acting as a check upon the use of ardent spirits, perceptible effects have been produced upon the morality of the people, particularly amongst the rising generation. Before the introduction of Australian wines, the majority in the colonies, especially the working classes, drank nothing but strong rum or brandy of inferior quality, and the effects of the unrestricted consumption of these liquids had become most demoralising. But owing to the resources possessed by the manufacture from the pure juice of the grape, a very sensible change for the better has taken place in the habits of all classes. The labourers now prefer colonial wine, which can be procured at a cheap rate, instead of bad spirits. The decrease in the imports of foreign wines shows clearly that similar preference has been given over the stronger fortified wines imported from Europe. The vine may therefore be regarded as a salutary instrument to further the rural progress and consequent prosperity of the great island-continent of Australia.

It is to be hoped that when the Australian wines become better known and more generally used that they may commend themselves to the British public. There is said to be something new in their flavour, not to be found in the strongly fortified kinds of Spain and Portugal, and the purity for which they are now condemned may cause them hereafter to be liked and appreciated. The success of the *vignerons* will depend upon their own appreciative faculties, and the awards of jurors, so far satisfactory, must be followed by the verdict of the great body of the consuming public. The high rate of alcoholic properties produced by the climate are found to hinder their importation into this country under the lower scale of duties accorded to the French clarets, and we should gladly welcome any adjustment that would foster these distant efforts at viticulture; but at the same time much might be urged upon the Australian colonists upon the subject of reciprocity in commercial tariffs.

FARMERS' POLITICS IN SCOTLAND.

At the Tarland show dinner Mr. M'COMBIE, M.P., said: I am certain every one here has the interest of the tenant-farmers at heart, and, as I only wish to speak on their behalf, I am sure that even those gentlemen who are on the opposite side of politics will favour me with a fair hearing. I trust it may not be out of place in a meeting of farmers whose interests are identical to make a few observations with regard to the past, and our present and our future prospects. In the few observations I should wish to make, I will make no difference as to the Liberal or Conservative interest. Neither shall I speak on any subject that had not the concurrence of the Conservative candidates at the last election, and the concurrence of my honourable opponent at the late contested election in West Aberdeenshire. A great number of our large landed proprietors supported Mr. Edward Ross, and are compromised to his utterances. I should be sorry to say one word as to their consistency, but in speaking a

few words as to our common interests, to which the Conservative members pledged themselves at the late election, and on questions where we all agree, I trust my remarks will not be offensive to any one. Now it cannot be denied, and it is deeply to be regretted, that the late Government did less than nothing for the tenant-farmers. There is no doubt we were deeply injured, for it was to the Scotch counties they mainly owed their majority. Now, what was the result? The farmers at the late election resented the injustice, turned out the Liberals, and put in the Conservatives. The old Liberal members of the Scotch and English counties had generally to give place to Conservative candidates. The Conservatives are now in power, with an overwhelming majority at their backs. How have they redeemed their pledges? The Scotch Conservatives who turned out the Liberal members pledged themselves to repeal the Law of Hypothec, virtually to repeal the Game-laws, to give compensation for unexhausted

improvements, and to abolish the gun and shepherds' dog-tax. The English farmers were promised repeal of the Malt-tax, security of tenure, and compensation for improvements. How have these solemn pledges been fulfilled? Not one of these measures has even got a hearing. We have got no redress for our grievances. But an influential member of the Conservative side of the House, professing to be a tenant-farmer and the tenant-farmer's friend, introduced a bill—the Rabbit Bill. I had nearly forgotten about it. It was just a new Game-law in disguise. The members of his own side of the House were so much ashamed of it, that after the few remarks I made in proposing that the bill be read a second time that day three months, which was so ably seconded by my friend Sir George Balfour; without further discussion the bill was withdrawn. And this is the only measure that has been brought before the House by the Conservatives for our relief. Now, as to Mr. Vans Agnew's Hypothec Bill. From week to week we found it on the paper, but as the session advanced it was always further down, and the last time there were twelve important measures before it. To do Mr. Vans Agnew justice, I do believe he wished to pass his bill, and at the beginning of the session he had strong hopes of it being carried, but a great opposition arose against it by a few influential Conservative members, and their influence prevailed, and the bill never even got a hearing. I know more about the postponement of the bill than it would be prudent to mention. I was deeply interested on the subject, and I do not blame Mr. Vans Agnew; but this I may say, that it was shelved by a few noisy agitators, who wish to give no concession to the farmers. But the tenant-farmers will continue to press their questions, and if they are resolute and firm they will, I feel sure, obtain from the country the justice which is due to them. The tenant-farmers will, I believe, be offered a sop, viz., the repeal of the gun-tax and the shepherds' dogs tax next session. But will the tenant-farmers accept of this sop? No. We will only take it as an instalment, but we will support the repeal of all such obnoxious taxes. The tenant-farmers were indebted to the right hon. gentleman, Mr. Lowe, for the gun-tax, the shepherds' dogs-tax, and many other good actions during his imperious reign. But it is my belief that, except compelled, the majority of the Government are not particularly anxious to redress our main grievances. The truth is we have been completely sold by the late Government, and still more egregiously by the present, for they pledged themselves more deeply than the former. Now I should wish to put it to the tenant-farmers, "How long are you disposed to allow the present state of matters to go on? Are you to sit down and rest on your oars under such injustice staring you in the face? If you do not bring your members to book during the recess for the gross injustice you have received at their hands, you are not the men I believe you to be. You have the matter in your own hands, and you will have yourselves to blame if you do not assert the influence of your position." I can safely say, speaking for the tenant-farmers of Scotland, that if the present Conservative members don't redeem their pledges—"it is as sure as death"—that at the first opportunity their services will be dispensed with. It is but justice to say that the farmers have a few friends in the Government, but they are puzzled and over-weighted by other members of the Government, but the great farce has been principally played out by the wirepullers behind the curtain, who are determined to give no concessions that they can prevent to the tenant-farmers.

The MARQUIS OF HUNTY said the suggestions of Mr. McCombie were such as every landlord should take specially to heart. He wished to say upon his own behalf, and he was certain on behalf of most of the landlords upon Deeside, that they would certainly freely give to the tenants the right they claim, if they would show that they were right. He went a great length with Mr. McCombie, and was clearly of opinion that there were some things which the Legislature would do well to set right. There were gentlemen who differed from him, and some in a way that sometimes amused him. Of this stamp was the writer of a letter in the *Aberdeen Journal*, signing himself "Donside," who made several pointed references to himself a splaying off ærated politics in the north. Without taking further notice of "Donside," he advised him to make himself master of his subject before he commenced writing about it. The writer dealt out a good deal of abuse on him (the Marquis) for naming the Enclosure Commissioners as unpractical people, and was evidently unaware that this present moment

no landlord could move hand or foot without the Enclosure Commissioners of the Court of Session. Landed proprietors under the Law of Eutail, who wished to do anything on their property and to charge the property a reasonable rate for it, cannot do so without going to the Enclosure Commissioners or the Court of Session, necessitating a long and expensive process.

At the New Deer cattle show dinner, Provost Leslie, proprietor of Nethermuir, said the constituency of Aberdeenshire were favoured with two most excellent members, who stood true to their colours and faithfully performed the promises which they made. The present company were, doubtless, better acquainted with Mr. Fordyce than he was, and knew well the attention he paid to his duties, while his kindness and urbanity to every one was of the most laudable nature. On questions affecting agriculture, Mr. Fordyce was in Parliament always to be found on the side of progress, and the speeches made and measures produced there spoke more forcibly of his worth than he could. Mr. McCombie was a tried man, who had done very much to raise the character of Agriculture in Aberdeenshire. His name was not only well-known in this district, but in England and abroad, as a successful rearer of cattle, and he had helped more than many to advance that great interest upon which so much depended in Aberdeenshire, namely, the rearing of fat stock, which brought so much revenue into the country. In all Mr. McCombie had done he had shown himself to be a good man and a true. Mr. McCombie did not speak often, but always spoke with effect on subjects which he understood, and when he did speak he was listened to with attention from both sides of the House.

Mr. FORDYCE, M.P., spoke in high terms of McCombie's worth, both as a Member of Parliament and a colleague. The past session has been exceeding devoid of interest when looked at from an agricultural standpoint; and from his own experience of the present Parliament, he thought that the tenant farmers of Scotland had very little to expect from it. They might possibly find that collie dogs might be exempted from taxation, and that the occupiers of land would be allowed to destroy wood pigeons and crows free from the necessity of taking out the gun licence, but as for any thorough revision of the Game-laws and land-laws, he feared they would look in vain. For himself he expected more from the gradual formation of public opinion and its influences upon the minds of the landowners, apart from legislation. He had read with great interest the discussion in the Chamber of Agriculture, and the report upon leases of Patrick Murray, of Ochertyre. It seemed to him that the terms of these leases furnished a good basis for securing the tenant farmers of Scotland in the benefit of the capital which they put into the soil, apart from legislation. He was of opinion that if this suggestion was carried out by the landowners, the land question would be practically settled. Unless the law of entail was abolished such form of lease would be inoperative in many cases, because many proprietors could not afford to pay large sums for improvement. He meant, however always to urge upon the members of the Government the necessity of having the law of entail abolished. The bill which he and Mr. McCombie had brought before Parliament this year and which, like many more bills, had to be withdrawn, he had good reason to believe that if it had gone on he would have received the support of the majority of the Scotch members. It seemed surely a reasonable proposition, and very moderate, that where the tenant had to build additional houses for his accommodation, if he did not get compensation for them at the end of the lease, he should be allowed to remove them; and that where labourers' cottages did not exist for every 100 acres of land cultivated, and where the tenant supplied the deficiency, he should be allowed for every cottage found suitable by the Sheriff of the county, £100 of compensation. These propositions were embodied in his bill, and he thought they were not only fair and just, but very moderate. If any one cared to read the evidence of Mr. Caird he would find that that gentleman was much dissatisfied with the labourers' cottage accommodation, and brought forward the fact that on two-thirds of the farms in Scotland the working classes were living in houses deficient of the requisites of decency and comfort. Such statements were to a great extent the means of inducing him to bring in the bill, and he intended to peg away at it till he got it carried through. It had been said that when bills were first brought into Parliament they were laughed at, secondly they were abused, and thirdly carried. He thought his bill had passed the first stage at least.

THE AGRICULTURAL STATISTICS OF IRELAND, FOR 1874.

TO HIS GRACE JAMES, THE DUKE OF ABERCORN, K.G., LORD LIEUTENANT-GENERAL AND GENERAL GOVERNOR OF IRELAND.

MAY IT PLEASE YOUR GRACE,—I had the honour of submitting, on the 31st ultimo, a return by counties of the acreage under flax in the years 1873 and 1874, with the number of scutching mills in 1873. I now beg to submit the annual general abstracts, which give, as usual, by counties and provinces, the entire area under each description of crop; also the total number of horses, cattle, sheep, and pigs, and their estimated value. The collection of the Agricultural Statistics, which commenced on the 1st of June, occupied about two months. The enumerators, of whom nearly 3,800 were employed, were selected from the Royal Irish Constabulary and Metropolitan Police, and, I need scarcely observe, discharged this duty with their usual efficiency. The various holdings, which amount in all to about 600,000, were visited by them, and the names of the several parties from whom the particulars of tillage and live stock for each holding were obtained, are stated on the returns, with a view to further inquiry in any case, should it be found necessary. Your Grace is aware that the information given to the enumerators is altogether voluntary; and I feel assured it will afford pleasure to your Grace to learn, as, I beg to say, it is most gratifying to have it in my power to state, that so far as I am informed by the officers who acted as superintendents of districts, the returns have been collected without difficulty—a fact highly creditable to the good feeling and intelligence of all ranks and classes connected with land in this country. In all Ireland there was this year only one refusal to give the required information reported by the enumerators; but on my writing to the party, and sending him blank forms for tillage and stock, as I have for many years been in the habit of doing in similar cases, I in a few days received the returns filled up, together with a very courteous reply. The abstracts have been carefully compiled from summaries made by the enumerators for their respective districts. They may differ in some degree from the revised figures which will be hereafter published; but I do not apprehend that any changes of importance will become necessary.

The total acreage under all crops this year was 5,267,839
 Ditto in 1873 (revised numbers) 5,270,746

Showing a decrease in the extent under crops in 1874 of 2,907

The crops which increased in extent this year are—

	Aces.	Aces.	
Cereals..... { Wheat	21,157	21,796	
{ Bere and rye	639		
Green crops { Mangel and beet-root	65	8,119	
	{ Cabbage		4,930
	{ Carrots, parsnips, and other green crops		3,124
Meadow and clover		67,835	

Total increase on the foregoing crops 97,750

The crops which decreased in acreage in 1874 are—

	Aces.	Aces.	
Cereals..... { Oats	30,786	51,026	
{ Barley	18,769		
Green crops { Beans and peas	1,471	27,220	
	{ Potatoes		10,841
	{ Turnips		14,361
	{ Vetches and rape		2,018

Total decrease in the foregoing crops 100,657

Making a net decrease in the area under all crops of 2,907

It appears from the foregoing summaries that, compared with 1873, wheat shows an increase of 21,157 acres, bere and rye of 639 acres, mangel and beet-root of 65 acres, cabbage 4,930 acres, carrots, parsnips, and other green crops of 3,124 acres, and meadow and clover 67,835 acres.

In oats there is a decrease of 30,786 acres, barley of 18,769 acres, beans and peas of 1,471 acres, potatoes of 10,841 acres, turnips of 14,361 acres, vetches and rape of 2,018 acres, and flax of 22,411 acres.

* Exclusive of the larger Rivers, Lakes, and Tideways.

The acreage under the head of "Bog and Waste unoccupied," had not any Live Stock on it at the period of the enumeration.

The entire number of emigrants (*Irish*) from Ireland, from 1st May, 1851—the period when the Enumeration commenced—to the 30th June last, was 2,298,526, of whom 1,228,863 were males, and 1,069,663 were females.

LABOURERS' DWELLINGS.—It is impossible, both on social and sanitary grounds, to exaggerate the importance of improving the dwellings of the labouring classes in Ireland; the Legislature has enabled the Treasury to grant loans for this most desirable object through the medium of the Board of Public Works, Dublin. According to the census of 1871, the number of fourth-class houses in Ireland, most of which had only one room for the entire family of every age and sex, was ascertained to be very considerable, and in these were living nearly half a million of persons.

WEEDS.—Although very great improvement in the breeds and value of every description of farm stock has been effected in Ireland, it must be admitted that a corresponding improvement has not taken place in the cultivation of the land. On several occasions I have felt it my duty to solicit public attention to the incalculable injury arising from the unchecked growth of weeds which is, unhappily, permitted in almost every part of the country, and also along the sides of roads, railways, and canals. On this subject I have now given extracts from former abstracts containing valuable information from the writings of Sir John Sinclair and other eminent persons, which I trust will prove useful to those engaged in the cultivation of land. I have also appended some extracts respecting the vast injury and great pecuniary loss (estimated at nearly two millions sterling) caused by weeds in Ireland from that valuable publication, the "Leisure Hour," in its number for May and June of last year, together with two articles on the subject which appeared in the "Freeman's Journal." At the annual meeting in 1872 of the Royal Agricultural Society in Belfast, the noble President, Lord Lurgan, K.P., referred to "the necessity of acting on the suggestions thrown out in the reports of the Registrar-General in relation to the extirpation of weeds. They did a deal of mischief, and he thought they should carry out the sentence which the old Scotch law pronounced, declaring anyone to be a traitor who poisoned the queen's land with weeds."

I again beg to repeat my respectful acknowledgments to the landed proprietors, tenant-farmers, the clergy of all denominations, and to the public press in Ireland, for a continuance of the same generous and valuable assistance which I have now for so many years experienced in connexion with these statistics. I have the honour to be your Grace's very faithful servant,
WILLIAM DONNELL, Registrar-General.

General Register Office, Charlemont House, Dublin,
14th August, 1874.

A HONEY YEAR.—1874 will be better for honey than any of the six preceding years. March and the first half of April were very unfavourable for bees in this part of the country; also the whole of May. This, together with the weak state of the hives, made swarming late generally. In June the weather took a more favourable turn for bees, which have been doing moderately well ever since. From a bee-keeping point of view, rain is much wanted in this locality; we have had one shower only for many months, and that shower did not penetrate more than three inches deep. Here we have a thin peaty soil resting on twelve or fifteen feet of white sand and gravel. Hence the fields are parched, and white clover is not yielding honey so plentifully as it usually does in similar hot weather. On heavier land, where clover is more plentiful, bees are doing better. Still, all are moving onwards; swarms are filling their hives, and old stocks that yielded them are now pretty well filled with honey. We have turned out a lot of ours from which we get about 20lbs. per hive of excellent honey. Though honey-dew appeared on sycamore and oak trees, the bees fortunately did not touch it this year. I am encouraged to believe that the honey harvest will generally be large throughout Great Britain and Ireland. Apianians should take notes of observations and results, and send them to the editors. The practical work of the bee-master is now to prevent swarming, by giving his bees room enough in ekes, supers, and nads.—*Journal of Horticulture.*

THE GROWTH OF FLAX IN IRELAND.

RETURN, showing, in Statute Acres, the Extent under Flax in each County and Province in 1873 and 1874, compiled from information obtained by the Royal Irish Constabulary and Metropolitan Police, who act as Enumerators; also the number of Scutching Mills in each County and Province in 1873.

1861	147,957	1873	129,297
1862	150,970	1874	106,886

The foregoing Return—which exhibits a Decrease of 22,411 acres in the total area under Flax in Ireland in 1874, compared with 1873—is published, as in previous years, in anticipation of the General Abstracts of Tillage and Live Stock. In the Province of Ulster alone the decrease is 20,526 acres. Of the entire number (1,427) of Scutching Mills in 1873, 1,335 were in Ulster, 29 in Leinster, 33 in Munster, and 30 in Connaught. I do not apprehend that any important difference will be found in the acreage under Flax given above, and that which will appear in the Tables of the General Abstracts, which are now being compiled, and will soon be published; they will give the acreage under the various crops, and also the number of Live Stock, by Counties and Provinces.

General Register Office, WILLIAM DONNELLY,
Dublin, 31st July, 1874. Registrar-General.

THE LOCAL AUTHORITY IN SCOTLAND.

A special meeting of the Local Authority for Aberdeen-shire, under the Contagious Diseases Animals' Act, was held in Aberdeen, Sheriff Comrie Thomson, presiding.

The report from the Inspector of the County, with reference to the present state of pleuro-pneumonia, was read as follows :
Aberdeen, 12th August, 1874.

MY LORDS AND GENTLEMEN,—Since my last detailed report on 10th April last, I regret to say that there has been 22 new outbreaks of pleuro-pneumonia. The following are the particulars of each of these outbreaks, so far as they are known to me: Pleuro-pneumonia was declared to exist amongst the stock of Mrs. John Walker, Blackpots, Old Deer, on the 11th April. The stock consisted of 63 animals, 38 of which have become affected and been slaughtered. The last case occurred on 7th July, and the place has now been cleansed and disinfected. Mrs. Walker purchased a lot of Irish cattle in the month of January last, and there is little doubt but that they brought the disease along with them. That a great number of the animals on this farm became affected is to be attributed to the fact that a severe attack of foot-and-mouth disease broke out at the same time; free communication between the byres also assisted to spread the disease. On 28th April, pleuro-pneumonia was declared to exist amongst a lot of dairy cows belonging to Alex. Singer, South Deunore, Oldmachar. The stock consisted of 14 animals, 12 of which have become affected and been slaughtered. The last case occurred on 21st July. The owner purchased two cows from John Duncan, cattle salesman, Aberdeen, about the beginning of April, one of which became affected first. Pleuro-pneumonia was declared to exist at North Murcar, Oldmachar, occupied by Mrs. Beattie, on 28th April. The stock consisted of 9 animals, 3 of which have been slaughtered. The last case occurred on 16th July. The farm adjoins South Murcar where disease previously existed, and unless the animals on the two places came in contact, the cause of this outbreak is not apparent. Pleuro-pneumonia was declared to exist amongst the stock of Robert Wilson, Lethenty, Tullynessle, on 23rd June. The stock consisted of 43 animals, 8 of which have become affected and been slaughtered. The last case occurred on 22nd July. Mr. Wilson purchased some English cattle from William Gordon, cattle dealer, Aberdeen, on 17th October last, and disease first showed itself in one of them. Pleuro-pneumonia was declared to exist at Upper Cairnfield, Oldmachar, occupied by William Cruickshank, on 27th May. The whole of the animals (4 in number) have been slaughtered, and the place thoroughly cleaned and disinfected. The owner purchased a cow from John Duncan, Aberdeen, on 4th April, which became first affected. Pleuro-pneumonia was declared to exist amongst a lot of 6 one-year-old Irish stirks belonging to James Leys, South Meanecht, on 2nd June. Four animals have become affected, and been slaughtered. The owner purchased the cattle from John Duncan, Aberdeen, about 29th April, and they no doubt give rise to this outbreak. The last attack occurred on 16th July. James Hay, Little Ythsie, Tarves, purchased a cow from Wm. Wood, cattle dealer, Newmachar, on 28th May, which was killed and found to be affected, on the 3rd June. She had not mixed with the rest of the cattle, and no more cases occurred. Pleuro-pneumonia was declared to exist amongst the stock of Alexander Murray, Nethermill, Cruden, on 4th June. There

were 61 animals on the farm, six of which have been slaughtered. The last attack occurred on 29th June. Mr. Murray purchased seven Orkney cattle from John Duncan, Aberdeen, on 22nd April, and they have been the only animals affected. Pleuro-pneumonia was declared to exist at Berryhill amongst a lot of twelve Irish cattle belonging to John Hunter, brewer, Peterhead, on 9th June. Mr. Hunter purchased the lot in an Edon market on 2nd March. They were kept for some time at his farm of Damhead until put out to grass at Berryhill. Five of the animals have become affected and been slaughtered. The last attack occurred on the 11th July. The disease manifested itself at the same time in a cow belonging to William Alexander, Springhill, Peterhead, which had been brought from the farm of Damhead on the 28th of May, and had been in contact with the Irish cattle above alluded to. No more cases have occurred at Springhill. Pleuro-pneumonia was declared to exist amongst the stock of Thomas Findlay, auctioneer and cattle dealer, Peterhead, on the 11th June. The owner had placed eight cattle on turnips at the farm of Annieswells, Old Deer, and had removed them on the 25th May to a grass field at Little Kirkhill, where they became affected. Two animals became affected, and have been slaughtered. The last attack occurred on 15th June. In consequence of disease appearing amongst Mr. Findlay's cattle, after having been removed so recently from Annieswells, I examined the stock on this farm, belonging to John Mitchell. I made a *post-mortem* examination of a calf which had died on the 26th of May, and found undoubted evidence of the disease. The owner states that he lost two calves in the end of April, both of which he is now convinced were affected with pleuro-pneumonia. Five animals have become affected, and been slaughtered. The last attack occurred on 7th July. Mr. Mitchell has lost a number of calves at intervals, and these were principally purchased from Mr. Anderson, Clochean, Old Deer, who imports large numbers from the south. There is little doubt but that disease has been brought to this farm by one or other of those imported calves. Pleuro-pneumonia was declared to exist amongst the stock of Charles Watt, Meikle, Balthangie, Monquhitter, on 23rd June. There were 28 animals. Five became affected, and have been slaughtered. The last attack occurred on 23rd July. The owner purchased an ox in Cuminstown fair about the 30th April from James Carmichael, cattle dealer, Keith. It died about the 6th of June. I examined the lungs, and found that the ox had been affected with the disease. One of two cows belonging to William McWilliam, crofter, Getherdams, Tullynessle, became affected on 24th June, and was slaughtered. The other cow and a calf, being the whole stock on the croft, remain healthy. The owner, who is grieved to Robert Wilson, Lethenty, had taken the cow from that farm about six weeks previous to the outbreak. The disease was declared to exist at Wester Kinglesser, Fraserburgh, occupied by John Oliphant, on 6th July. The stock consisted of 20 cattle, 4 of which have been slaughtered while suffering from the disease. The last attack occurred on 1st August. The owner purchased two cows at a sale of cattle belonging to John Smith, Fraserburgh, about 20th February; one of these cows was the first to become affected. I examined a cow belonging to George Elmslie, crofter, Hill of Cotburn, Turriff, on the 7th July, found her affected, and ordered her slaughter. James

Carmichael, cattle dealer, Keith, sold an ox in a Turriff market, about 13th May, to Alex. Thom, crofter, Litterty, Monquhitter, who resold the animal on the 27th May to George Elmslie. The animal died, but the true nature of the disease was not ascertained till the cow became affected. A cow, the only animal on the place, belonging to James Henry, crofter, Davishill, Foveran, was found affected on 14th July, and was slaughtered. The cow was purchased from William Wood, cattle dealer, Newmachar, on the 1st May. Pleuro-pneumonia was declared to exist among the stock of Andrew Cowieson, Millseat, King Edward, on the 17th July. He purchased an ox in a Turriff market about 13th May, from James Carmichael, cattle dealer, Keith, and there is little doubt the ox brought the disease to this farm. There were 27 animals on the farm, one of which has become affected and been slaughtered. Pleuro-pneumonia broke out among the stock of James McKessor, Percyhornie, Fraserburgh, on 18th July. The stock consisted of 25 animals, 4 of which have become affected and been slaughtered. The owner purchased a cow from John Mowatt, Moss of Cardno, Fraserburgh, on the 20th of April. Mowatt was a purchaser of cattle at the same sale of stock in Fraserburgh, at which John Oliphant, above mentioned, bought, and it is therefore not unlikely that the disease has been brought to this place by the cow. Pleuro-pneumonia was declared to exist at Brae-side of Kinnundy, Skeue, occupied by John Henderson, on 6th August. The stock numbers 34, one of which has become affected and been slaughtered. The owner had a calf which died on 15th July, and affected in the lungs. I have not yet ascertained the cause of this outbreak. I visited Abbotshauigh, parish of Monquhitter, occupied by Walter Allan, on the 19th instant, and found 2 cows affected. One calf, 7 months old, died about the end of May, and the owner is now convinced it also was affected with pleuro. I have not ascertained particulars as to the cause of this outbreak. Yesterday I examined 12 cattle belonging to James Carmichael, cattle dealer, Keith, which are in one of the Castle Parks at Huntley, and found one of them affected with pleuro. The owner had removed the animals about the middle of May from the farm of Colleonard, Banffshire, where disease was afterwards found to exist. I have before reported that I consider 30 days after the last case too limited a period during which an infected place should be under the restrictions of the Act. And you have more than once memorialised the Privy Council on the subject. I am still convinced that a considerable extension of the period is absolutely necessary before we can effectually deal with the disease; and I hope you will again urge upon the Privy Council the expediency of increasing it to 60 days at least. In many cases I find that cattle have been removed from an infected place shortly before the declaration of disease. I am of opinion that Local Authorities should be authorised, if the removal has taken place within 30 days prior to the discovery of disease, to put the places to which cattle have been removed also under restrictions.

I am, my lords and gentleman, your obedient servant,

JAMES THOMSON.

The following communication from the Clerk to the Banffshire Local Authority was read: In consequence of the prevalence of pleuro-pneumonia in this county, the Local Authority under the Contagious Diseases (Animals) Act, 1869, met and passed an order prohibiting the holding of cattle markets within the county for the next month. And I was instructed to forward a copy thereof to you, in the hope that your Local Authority would issue an order to prohibit the holding cattle markets at Turriff, as disease exists in that district. I send herewith a print of the order. I also, by desire of the meeting, send you a copy of the memorial to the Privy Council, which explains itself; and will be glad to know if the Local Authority of your county will make any representation.

Mr. THOMSON, the Inspector, at the request of the Chairman, gave his opinion on the question of whether it was of much practical use to stop the cattle markets. As long as the sales of dealers were allowed to go on he did not see that the suspension of the ordinary markets would produce much good in the way of stopping the spread of the disease. It was well known that it was at these sales and auctions that the disease was spread, where parties could easily get their beasts put up for sale without their own names becoming known as the sellers.

Mr. BARCLAY, M.P.: I am sure we all sympathise very much with the Local Authority of Banffshire in their anxiety to take measures to limit and exterminate pleuro-pneumonia, which, I believe, in certain respects, is a more troublesome and dangerous disease to deal with than cattle plague. We are all very glad to see the vigilance which is being exercised by the people in Banffshire, for, although they have always been ready to deal vigorously in checking the disease, as much cannot be said for other Local Authorities elsewhere. We are also all very anxious, I am sure, as well on our own behalf as that of the people of Banffshire, to take any measure which promises to be effective in preventing the spread of disease; but I think it incumbent upon us, before taking steps which will certainly give inconvenience to many, to satisfy ourselves that the restrictions contemplated will really have a tendency, or are calculated to produce results preventing the spread of the disease. In our experience in Aberdeenshire, we have found, and I think the Inspector will bear me out in saying so, that the disease has been introduced into and spread in the county, not so much by local markets as by English or Irish cattle introduced directly to the county, or by the public sales of dealers which periodically take place in various districts. No doubt cattle imported into the county are exposed in the local markets, but to prevent the holding of these markets would be to encourage these local dealers' sales, which have been the great means of spreading the disease in this county. Were this a proposal to prohibit the import of cattle from the south—say Irish and English cattle—I am quite of opinion that such a measure would have great effect, coupled with a vigorous treatment of the existing cases within the county, in exterminating the disease, but I do not say that, looking to the very serious inconveniences that would arise, I am prepared to advocate or support such a proposal. Before the House of Commons' Committee last year, it was conclusively proved that pleuro-pneumonia could not be communicated by any external matter; that attempts to communicate the disease from one animal to another by inoculating with diseased lung—by introducing parts of the diseased lung into the nostrils—or by any other extreme measures that could be devised, had entirely failed. The only exception was the evidence of Mr. Gamgee, who stated that in one case he had succeeded in communicating the disease. But the Committee from the evidence laid before them by all the leading authorities arrived at the conclusion, without any doubt, that pleuro-pneumonia could only be communicated by the live animal to the live animal, and with the death of an animal affected with pleuro-pneumonia all risk of infection ceased. If, therefore, the Local Authority in Banffshire took care—and I have no doubt they will take care—to prevent animals being removed from farms where disease exists, that is, with the present powers which Local Authorities possessed, the only really effective measure which could be adopted. But I do not believe that the stoppage of the markets would produce any material result in the direction they hope, and would cause very serious inconvenience, not only to the cattle trade, but to other agricultural business. I think it would be unfortunate to cause inconvenience unless there was reason to believe that advantages would arise from the restrictions, because when the county was subjected to restrictions which were of no use, it made people impatient and unwilling to submit to such restrictions as the Local Authority might afterwards come to see would really be of benefit, and likely to prevent the further spread of the disease. I therefore propose that we should express our regret that we cannot comply with the request of the Local Authority for Banffshire, and that we do not see it expedient at present to prohibit Turriff markets.

Mr. H. L. MORRISON, of Blair, seconded.

The CHAIRMAN concurred entirely with what Mr. Barclay had said in regard to the matter. The Banffshire Local Authority had ever since the Act had been passed, been anxious to carry it out, and they had never had to complain of that Local Authority, as they had of others. He therefore came to the consideration of this memorial with the feeling that unless some good reason could be shown to the contrary they should accede to the suggestions it contained, and adopt the course they had taken in Banffshire. Although he had not the practical knowledge of some on this question, yet his own observation—and he had made it his business to observe the matter closely—concurred with the views of the inspector and Mr. Barclay, and he believed they need not at present take

the very strong step of putting a stop to the ordinary local cattle markets.

The motion proposed by Mr. Barclay was agreed to.

The CHAIRMAN drew attention to the reference in the memorial from Banffshire, and in their own report, of the extension of time from thirty days to sixty or ninety days. He had no hesitation in saying that they entirely concurred with the views of the Banffshire Local Authority on that subject. The Aberdeenshire Local Authority had for years repeatedly memorialised the Privy Council on the subject, and they could have no hesitation now in expressing concurrence with the Banffshire Local Authority; at the same time, however, bearing in mind that it was the House of Commons and the Government that had to memorialise, and not the Privy Council, as the point involved an alteration in the Act of Parliament, and not a mere Order in Council.

Mr. BARCLAY: It occurs to me that the most direct way for the people of Banffshire to give effect to their views on the amendment of cattle legislation would be to submit their suggestion to the Duke of Richmond, who is a large landed proprietor in the county, and who is at the head of the veterinary department of the Government. Formerly the Vice-President of the Council, Mr. Forster, had charge of this department, but when the subject was before the House of Commons, Lord Sandon, the present Vice-President of the Council, informed me that he did not know anything regarding the veterinary department, which the Duke of Richmond had taken under his control. If the local authority for Banffshire then can satisfy the Duke of Richmond as to the expediency of the change they suggest, that will be the direct way to the amendment of the law, for the Government would doubtless

give effect to and support any measure which the Duke would recommend in a department under his own charge; and as regards the proposal to extend the period from thirty to sixty days during which cattle should not be removed from a place where pleuro-pneumonia existed, the committee of the House of Commons was unanimous in recommending that change.

On the suggestion of the chairman, a committee was appointed, consisting of the following gentlemen: Colonel Innes of Learney; Mr. Barclay, M.P.; Mr. Cochrane, Little Haddo; Mr. McCumbie, M.P.; and Mr. Scott, Glendronach; and Sheriff Thomson, to confer with the committees that might be appointed by the counties of Banff and Moray, for the purpose of making representations to the Duke of Richmond by deputation and otherwise.

A communication from the Elginshire local authority, in reference to a letter from the Queen's Remembrancer, requesting that payment be made of a moiety of the penalties that had been recovered in prosecutions under the Contagious Diseases (Animals) Act, 1869, was read. The chairman pointed out that, according to this Act, one-half of the penalties recovered fell to the Crown, but hitherto this had not been paid. The Elginshire authority wished them to join in a representation that this claim might be departed from, as the counties had been at considerable expense with regard to the matter, and to this suggestion he supposed there would be no objection. From their own accounts, it appeared that £155 had been paid for the prosecutions, and only £61 penalties recovered. It was agreed to concur with the Elginshire authority in any action they might take on the matter.

SCOTCH GAME CASE.

In the Justice of Peace Court at Forfar—Baillie Grant on the bench—the case of Major Lyon, of Ballintore, Forfarshire, against James M'Nicoll, jun., farmer, Wester Ballintore, was disposed of. The question involved was, whether the son of a tenant-farmer can go upon the uncultivated portion of the land of which his father has the right of pasturage and shoot rabbits.

Wm. Lindsay, gamekeeper, Ballintore, said, on evidence, that three or four years ago respondent commenced to shoot rabbits, and three years ago went on to the muir. Latterly he went to the hill pasture. Witness found respondent's son there, with his gun and dog, and often remonstrated with him for disturbing the game. On 17th July last saw him on the hill in question, which did not form part of the arable land. There were rabbits there. He fired several shots. There were also hares and grouse there. He killed two rabbits. He did not see the dog on the first occasion. When witness remonstrated with him he said he was ordered to shoot rabbits by his father. His dog disturbed the game. There was a fence across the hill for the benefit of the tenant. William Dunn, game watcher, Ballintore, corroborated.

James M'Nicol, farmer, Ballintore, said his son was employed on the farm and managed it for him. He looked after the sheep on the hill. The rabbits had increased greatly since Mr. Austin became tenant of the shootings. Witness found it necessary to keep them down for the protection of his crops, and furnished his son with a gun licence for that purpose. His crops had been injured by the rabbits. They seldom saw any grouse on the ridge between the pasture and the arable land.

David Clarke, farmer, Clintlaw, Airlie, said the rabbits appeared to have damaged the crops to a greater extent than he had ever seen.

Peter Smith, Easter Coul, said the rabbits had increased to a great extent since Mr. Austin became tenant of the shootings.

Mr. Anderson, for the petitioner, maintained that, though it had been held by a narrow majority of the Court that a tenant cannot be said to trespass on his own farm yet that the son or brother of a tenant can be said to trespass in exactly the same way as it had been held that a farm-servant may be guilty of trespassing on the farm on which he is a servant, because he trespassed in pursuit of game. The tenant's copy

of the lease was put in process, but Mr. Anderson, for the petitioner, held that that was not sufficient. However, even if it were sufficient, he maintained that he was entitled to a conviction in respect the tenant's right to the ground on which the trespass was alleged to have taken place was restricted to pasturage, the reason being, he understood, that the rent payable for the pasturage was so small compared with that given for the right of shooting. He had proved that the trespass took place not on the arable land, but on the pasturage.

Mr. Thornton, for respondent, maintained that, it had not been proved that the respondent shot at hares or grouse or other game. The point, therefore, was whether the tenant had a right to shoot rabbits. Now, rabbits were not reserved in the lease, and he quoted cases to show that an agricultural tenant was entitled to shoot rabbits if they were not reserved in the lease, and in this case the reservation in the lease was game only. This was the usual way in which farms were let, and the respondent was as much tenant of the hill as of the other portion of the farm. Were this low-lying country instead of hill, it would have been let as an agricultural subject. The hill could not be ploughed. Then a neighbouring farmer had told the Court that at the sheep-clipping, before there was any word of this action, the respondent had said that his reason for not trapping instead of shooting the rabbits was that he did not want to trap hares. This prosecution had been brought because, the year being so bad for grouse, the tenant of the shootings, Mr. Austin, wanted to get as much as possible out of the land.

The Justice, in giving judgment, said: It is not proved here that the respondent was in search of anything else than rabbits. There is no evidence to that effect. In point of fact, the gamekeeper spoke to the fact distinctly that he was only killing rabbits, and nothing else, and as they are vermin I hold it proved that he had authority from his father to kill them, and that his father had the right to grant him that authority, and he had an equal right to act upon it. I shall find that rabbits are vermin, that his father was tenant, and that he granted the right to his son, and dismiss the complaint. This finding does not in the slightest degree touch the civil case.

Mr. Thornton: I move for expenses in this case.

The Justice: Of course.

Mr. Anderson: I shall intimate an appeal in the usual way. The expenses amounted to £3 7s. 6d.

MANCHESTER.

To Manchester belongs the honour of having formed a distinctive school of public men in the Free Trade struggle; but Reform preceded, and was, indeed, the necessary forerunner of Free Trade. Like Birmingham, Leeds, and other large centres of industry, Manchester had been unrepresented in the House of Commons. The member given by Cromwell was of course taken away after the Restoration. The French War resulted in dear food, heavy taxes, and distress. The colliers dragged two cart-loads of coal from Bilston to Carlton House, the residence of the Prince Regent, in the hope that if they could bring their sufferings and want visibly before the actual head of the State he might put an end to them. A similar fancy took possession of the poor workmen of Manchester. In 1819, a year of fearful distress, they proposed to March to London and lay their complaints before the Regent. They proposed, of course, to walk all the way, to sleep under hedges or in barns at night, and the poor simple souls had provided themselves with blankets for that purpose. They were rather roughly treated by the not over-scrupulous authorities of the time. These eloquent though almost speechless proclaimers of the people's miseries were dispersed, imprisoned, and never allowed to reach the august presence of him whom they fondly hoped to move by their tale of woe. The remedy in which the people believed was Parliamentary Reform. Early in this memorable year of 1819 a great meeting was held at Manchester, and again the people resolved not to apply to Parliament but directly to the Prince Regent. Their profound disbelief in the want of sympathy between the Legislature and the people led to this infatuation. The year was destined not to pass without making wider the gulf between the rulers and the ruled, and the hatred of class against class, which had recently been of a grievously quick growth, was intensified by the shedding of innocent blood. This was the Peterloo massacre. The Government had published proclamations against "seditious meetings." The two "legislatorial attorneys and representatives for Birmingham" had been elected, and a proclamation against mock elections had also been issued. Nevertheless it was determined to hold a meeting in Manchester to petition the House of Commons for a reform of Parliament and the repeal of the Corn-laws. August 16 was the day fixed for the meeting, and a field near St. Peter's Church, called St. Peter's Field, the place. The people were assembled—60,000 in number—and the chairman, "Orator Hunt," was addressing them, when they were attacked by a body of yeomanry, who killed eight persons and wounded about 600 in the attempt to disperse the meeting and arrest its chairman. This attack of the yeomanry on the people has inspired several local ballads. I quote a verse from one of these broadsides as a specimen of the popular political muse of the time:

Mr. Hunt new com forrard an' spoke a few words,
When the Peterloo cut-my-throats shaken'd th' swords;
Aw thort sure enoof they were running their rigs,
Till aw seed morn nor twenty lay bleeding like pigs.

From this time the people of Manchester became bitterly earnest supporters of Parliamentary Reform, and when the time came rendered effective help in carrying the bill. It was here that in 1832, on the last defeat of the bill by the Lords, the advice was first given to "go for gold and stop the Duke." That this advice was given in earnest and with the intention of carrying it out to the fullest is proved by the fact that there was a run on the Manchester savings-banks, and no fewer than 620 depositors gave notice of withdrawals to the amount of upwards of £16,000. In a few graphic sentences Lord Macaulay has described the Manchester of 1685, when its population was under six thousand people. The Rev. W. N. Molesworth says that in 1830 "it was a political cypher, unrepresented in Parliament, and having the municipal institutions of a village." By 1846 it had grown to be "the metropolis of a great part of the northern and midland counties, and was more especially the centre of a district which was regarded as one that was emerging from barbarism, the inhabitants of which still used an uncouth dialect which provoked the derision of their southern countrymen, and which was chiefly known by its smoking chimneys, its perpetual

rains, the length and severity of its winter, its almost sunless summer, as well as by a lawless turbulence which embarrassed the Government, perplexed the Legislature, and dismayed the inhabitants of the more favoured parts of the kingdom." But the day of Manchester's political greatness was approaching. The inventions of Arkwright and the application of steam had developed her old cotton trade into one of the most thriving industries of the kingdom. The passing of the Reform Bill gave two members to the constituency, and hastened on the agitation for the repeal of the Corn-Laws—an agitation which was organised and conducted mainly by Manchester men, and carried to a successful issue by Manchester influence. Free Trade had its birth and growth in this great town, and its victories are due to the skill, the indomitable energy, and the irresistible logic of the Manchester School. The first members returned for Manchester were Ponlett Thompson, "afterwards Lord Sydenham, who at that time was the most conspicuous Free Trader in the kingdom, and Mr. Mark Phillips, well known as an ardent radical and a zealous Free Trader." Public opinion in the great towns was being educated by the teachings of these early advocates, by the stirring poems of Ebenezer Elliot, and by those still more effectual tutors—bad trade, low wages, high taxes, and empty stomachs. Manchester was by situation and by condition of the people admirably fitted to conduct such an agitation. She was the active and industrious centre of the rapidly increasing cotton trade, a trade largely depending on foreign markets, and the great mill owners and manufacturers found their energies crippled, their skill baffled, their resources jeopardised, and the industry and skill of their workpeople rendered of little avail by the influence of the Corn-Laws and the prevalence of protection. It was a question of life and death to the manufacturing interests, who entered on their Free Trade crusade with all the resolute calmness and unflinching courage of men who had calculated the strength of the enemy's entrenchments and were resolved to carry the position. The struggle cost ten years of sharp and unceasing agitation. The first Anti-Corn Law Association was organised in London in the year 1836, but it did little work, had comparatively no influence, and speedily died of inanition. It was in 1838 that the agitation became powerful, and it was then that an association was formed which was not dissolved until the work was done. The Anti-Corn Law League was founded in Manchester. When the time was ripe the man was ready. Richard Cobden came to the front, and with him were associated a bold array of able and earnest lieutenants: Ponlett Thompson, Mark Phillips, Dr. Bowring, J. B. Smith, Milner Gibson, George Wilson, C. P. Villiers, and John Bright. Cobden and Bright were the Achates of the agitation. They were in some respects the antitheses of each other. Cobden was calm, logical, unimpulsive; strong in reasoning, powerful in figures, a perfect master of the subject, he exercised an enormous influence over hearers and readers. Bright was fervid, eloquent, "terribly in earnest," and denunciatory. The difficulties were increased by the course taken by a large portion of the working classes. The time of the Corn Law League was also the period of the Chartist agitation, and Feargus O'Connor and his forces were arrayed against those led by Richard Cobden. Free Trade meetings were disturbed by Chartists. Amendments were proposed, although rarely, if ever, carried; and the battle of Protection was fought by Protection's own victims. The Chartists contended that the shortest way to repeal the Corn-Laws was to pass the Charter. Yet the corn laws were repealed twenty-five years ago by the unreformed Parliament, the Charter is not yet the law of the land, and the second Household Suffrage Parliament is governed by the old Protectionist party. For six years the Anti-Corn Law League worked unceasingly. The Leaguers built a Free Trade Hall in Manchester, and when that was burnt down they erected another: "the largest room available" for such purposes "in the kingdom." Bazaars were held in support of the League, and at one of these the money realised amounted to £25,000. The money raised for this agitation was enormous. In a speech at Covent Garden Theatre on February 19th, 1845, Mr. Bright said: "In the year 1839 we first asked for subscriptions, and £5,000 was given. In 1840 we asked for

more, and between £7,000 and £8,000 was subscribed. In 1841 we held the great conference at Manchester, at which upwards of 700 ministers attended. In 1842 we had our great bazaar in Manchester, from which £10,000 was realised. In 1843 we asked for £50,000, and got it. In 1844 we called for £100,000, and between £80,000 and £90,000 has been paid in, besides what will be received from the bazaar to be held in May. This year is yet young, but we have not been idle. We have asked our Free Trade friends in the northern counties to convert some of their property, so as to be able to defend their rights, and properties at the hustings. This has been done, and it now appears that, at the recommendation of the Council of the League, our friends in Lancashire, Cheshire, and Yorkshire have invested a sum of not less than £250,000 in the purchase of county qualifications." But this was not enough. Another appeal was made to the Manchester free-traders. A meeting was held at the League offices on December 13, 1845, of seventy of the largest subscribers to the funds, and it was resolved to make appeal for £250,000. Another meeting for this purpose was held on the 23rd, at which in an hour and a-half upwards of sixty thousand pounds was subscribed. Such is provincial public spirit in England. London was little more than a spectator of this stupendous agitation. Manchester was the political capital for the time. Free-traders throughout the land fixed their eyes on Manchester and from Manchester took their cue. To the great cotton capital belong the chief honours of the campaign and the victory. Manchester converted Sir Robert Peel and the Duke of Wellington from the old dogma of Protection to the new creed of free-trade. The town, which was unrepresented in the House of Commons in 1830, in 1846 dictated to the British Parliament a policy which is revolutionising the commerce of the world. The bill was adopted by the House of Lords on the 25th of June, and on the 2nd of July the League was dissolved. Its last acts were to vote £10,000 to its chairman, Mr. Geo. Wilson, and to take steps to raise a fund sufficient to enable Mr. Cobden to devote himself to the public service. The public influence of Manchester culminated for the time in the success of this famous agitation. To-day the "Manchester School" is a phrase of history and not of current politics. But its work did not quite cease in 1846. The Manchester School was inspired by two leading principles: Free-trade and non-intervention in foreign affairs. Non-intervention is not now the badge of a political section or the motto of an agitation; but the theory has had an immense influence on British statesmanship, and Manchester may fairly lay claim to much of the honour of such incidents as the Geneva Arbitration and the French Treaty. But if non-intervention has set its mark pretty deeply on British Imperial policy, as a banner of agitation it almost extinguished the "Manchester School." Cobden defeated Lord Palmerston in 1857 on the Chinese question, but it was upon our policy in the Crimea rather than upon our acts in China that in the general election which followed the Manchester School was defeated along the whole line. Cobden lost his seat, and Manchester rejected both John Bright and Milner Gibson by large majorities. But the decadence of the direct influence of the Manchester School is not a measure of the fall of the city's political influence. The school dies, but Manchester lives, and presently, when the time comes for understanding the political developments through which we are now passing, it will perhaps be seen that the great town which was once the capital of the free-trade movement became the real centre of that "Conservative Reaction" which has had almost as potent an influence upon a period of Parliamentary history as had the Anti-Corn Law League of thirty years ago. It must not be forgotten that the Manchester School, or rather the great body of politicians identified with it, were early leaders in the agitation for national education. In 1849 the Lancashire Public School Association was formed for the purpose of obtaining a system of national education very like that now advocated by the League. In October, 1850, a conference on the subject was held at Manchester, at which it was resolved "That the Lancashire Public School Association be resolved into a society to be called the National Public School Association, for the establishment by law in England and Wales of a general system of secular instruction, to be maintained by local rates and under the management of local authorities specially elected by the ratepayers." Mr. Cobden was one of the most earnest supporters of this association, and at a public meeting of the National Association

held also in Manchester on January 22, 1851, he moved a resolution and made one of his best speeches in support of the system proposed. The labours of this society prepared the way for future action on the education question; and although it failed in its direct object, it materially helped to form a healthy public opinion, to remove many prejudices, and to disseminate a large amount of information which has since been used with much practical effect. When this association failed it was speedily followed by the formation of an Education Aid Society, whose objects were to gather statistics, to create a demand for education, to inform and direct public opinion, and to pay the school fees, either in whole or part, of indigent parents. So useful was this society and so thoroughly praiseworthy its work that similar societies were formed in other large towns, and thus the way was prepared for the Government to deal with elementary education as a national question. In the formation of the National Education League Manchester took an early and somewhat influential part; but subsequently, in accordance with that turn of the great cotton capital towards Conservative reaction which began with the Crimean War and was strengthened by the course of the American War of Secession and its influence on Manchester manufacture, the chief educational influence of Manchester has been thrown into the scale of the rival society, the National Education Union, which has its head-quarters in that city. In fact, at the present moment Manchester is the greatest opponent of the doctrines of the National Education League; and if it is with any propriety that this last society is called the "Birmingham League" its formidable antagonist may with equal truth be described as the "Manchester Union." The town that accomplished free trade has done more than any other place in the country to prevent the repeal of the Twenty-fifth Section of the Education Act and to defend the denominational system of education from its enemies. The triumphs of Manchester are of various sorts, but they are triumphs none the less; and none can call in question the great influence of the famous metropolis of the North any more to-day than in 1846. In local matters the public spirit of Manchester has rarely been equalled and never surpassed. The wealthy have never failed in their duty. The public buildings which adorn the city are among the finest and most costly of modern structures. The Assize Courts, the Exchange, the new Free-Trade Hall, and the Town Hall are splendid examples of their kind. The charities are numerous, extensive, and munificently supported. Including the Peel Park at Salford, which is really a Manchester institution, there are four free parks, three of which were purchased by public subscription. To Manchester belongs the honour of establishing the first free library, in 1852, thanks to the unceasing exertions of Sir John Patten and Dr. John Watts. There are now one splendid Reference and six district Lending Libraries, each with a news-room attached. From the last published report (the twenty-first) I find that during the year 1872-3 "609,462 volumes were issued for home reading, 149,692 volumes were used by 137,723 readers in the branch reading-rooms, 92,852 volumes and 91,702 specifications of patents were issued in the principal or Reference Library to 54,172 and 984 readers respectively, being in the aggregate 943,708 issues to 703,300 readers." It is also stated that 1,741,960 persons have used the reading-rooms. "This, added to the number of borrowers and readers, makes an aggregate of 2,501,564 persons who have availed themselves of the free libraries" in one year. Every reader will remember the magnificent Art Treasures Exhibition which was opened in Manchester in 1857. In 1847 the town was created a see, and the Rev. Dr. James Prince Lee, then Head Master of King Edward VI.'s Free Grammar School at Birmingham, was appointed the first bishop; the second is the already famous Dr. Fraser. In the words of Mr. Disraeli, "What art was to the ancient world science is to the modern—the distinctive faculty. In the minds of men the useful has succeeded to the beautiful. Instead of the City of the Violet Crown, a Lancashire village has expanded into a mighty region of factories and warehouses. Yet, rightly understood, Manchester is as great a human exploit as Athens." It is, no doubt, to the doctrine of non-intervention, which was so conspicuous an article of the political creed of the Manchester School under Mr. Cobden's leadership, that is due in a great measure the change which has come over the course of Manchester politics. Free trade was thirty-five years ago a thing capable of realisation in the immediate future; non-intervention was a much more remote possibility. We are not

yet so civilised as to listen with cool blood to the trumpet of battle. The Crimean War was one of the turning points in the history of Manchester influence, and the doctors of universal peace came for the time to be regarded less as politicians than as prophets of the time foreshadowed by the poet—

When the war-drum throbs no longer, and the battle-flags
are furled
In the Parliament of man, the federation of the world.

There are other causes, however, for the more recent relations of Manchester towards the policy and progress of the nation. Apart from the Corn-laws, free trade was looked upon by the body of the working class rather as a manufacturer's than as a workman's question. No sooner was the Act passed abolishing the duty on corn than other social questions arose, in discussing which the Manchester School, true to its partcular principles of political economy, was placed in direct antagonism to the tolerably well-understood wishes and wants of the working classes. They opposed all factory legislation, and in opposing the Factory Acts they committed a political blunder, from the effects of which they have never yet recovered. The Protectionists, smarting under their recent defeat, supported Mr. Fielden's Bill for shortening the hours of labour in factories. The Manchester School opposed these measures. This was free trade with a vengeance, and Manchester was defeated, and the School lost its hold upon the sympathies of the working classes. The great body of the people in Manchester are divided into two classes—the wealthy mill-owners and the operatives who depend upon their daily work for their daily bread. It is almost impossible to avoid a certain lack of social sympathy between the two classes. They are too widely separated from each other in habits, tastes, manners, modes of

thought, and ways of living to produce that harmonious and organic whole which is required for joint action or for a deeply sympathetic pursuit of a common object and end. In this respect Manchester is in curious and not advantageous contrast with Birmingham. In the Midland capital, in consequence of the vast variety of industries and the small amount of capital needed to begin business in so many of them, the wealth of the place is more equally divided among its people, and there is consequently a closer union of interests, of tastes, and of common fellowship than perhaps under the circumstances is possible in Manchester. In Birmingham there are fewer millionaires and more well-to-do people in proportion to the population than in any other large town in the kingdom; in Manchester the case is reversed. Nevertheless in a city of upwards of half a million inhabitants, of almost exhaustless wealth, of great public spirit, of trained skill, of quick practical intelligence, the centre of one of the most important of the industries of the kingdom, it will always be comparatively easy so to awaken public interest and to excite public opinion as to give the city a powerful and for a time even a paramount influence in public affairs. That influence is less conspicuous to-day than at certain past periods in our political history. The school of politicians bearing the city's name on its banner, which passed laws and overturned ministries, has for all practical purposes ceased to exist. The work which has been done remains a great work in history; it has enriched our Statute Book, benefited the country, and earned and well deserved the thanks and gratitude of the nation; but the school is dead and its influence is gone, even before the departure of all those who took part in its creation. For such a city probably is reserved other and even nobler work in the future.—*The Gentleman's Magazine.*

THE ADULTERATION COMMITTEE REPORT.

The report of the select committee appointed to inquire into the operation of the Adulteration of Food Act, 1872, runs thus :

Your committee having held 14 meetings, and examined 57 witnesses, have arrived at the unanimous conclusion that the Act has done much good. It has, at the same time, inflicted considerable injury, and imposed heavy and undeserved penalties upon some respectable tradesmen. This appears to have been owing mainly to the want of a clear understanding as to what *does* and what *does not* constitute adulteration; and in some cases to the conflicting decision and inexperience of the analysts. Your committee, however, are of opinion that the Act itself is defective, and needs amendment.

TEA.—It appears that, since the report of 1856, certain grossly prepared teas have been imported from China, some being largely mixed with exhausted leaves and ferruginous sand, and others much too highly faced or coloured; the ingredients used for colouring being chiefly Prussian blue or indigo, powdered gypsum, and turmeric; but the total amount of such teas has been small, and is kept in check mainly by the low price of pure teas. The import of green teas has recently fallen considerably, in consequence, it is stated, of the operation of the act. Facing tea after the Act of 1872, practised to a small extent in this country; but whether in China or at home, the evidence is conclusive that in colouring tea no deleterious matter is used to such an extent as to be absolutely injurious to health; at the same time facing may be employed to conceal tea of a bad quality. Your committee have reason to believe that very little adulteration of tea is practised in this country. They would further observe that defacing tea, or removing artificial colour, seems now much more common, but this process does not appear to extract the ingredients which form the base of the colouring matter; it simply removes the colour, leaving all the other materials on the tea. It is proved that the bright green teas of China are always faced, and that the natural green teas of Japan, India, &c., are frequently of a colour hardly distinguishable from some qualities of black tea. While condemning the practice of highly facing tea, your committee cannot recommend that fairly faced green tea should be condemned as an adulterated article. Suggestions have been made that a certain percentage should be allowed for colouring matters and other

impurities in tea. But your committee consider that the limitation to a very small per-centage of foreign matter would exclude from the country some wholesome low-priced teas, which are largely consumed by the poor, and if a less stringent limit were adopted, it might have the effect of increasing the amount of facing laid upon the better descriptions of green teas. The Act has borne with considerable hardship upon the retail grocers, among others, from the following causes:—The evidence and samples being, in the first instance, entirely in the hands of the prosecution; the defendant being incapacitated as a witness; the sole employment of analysts, to the exclusion of practical judges of the article; the differences among analysts, and the magisterial decisions thereon; and the recent judgment of the Court of Queen's Bench, that under this Act the faced tea known as green tea is adulterated; but more especially that the alleged adulteration has taken place before the tea reached the retailer, and that he is not responsible for the frauds and tricks of the Chinese manufacturer. It has been repeatedly suggested to your committee that an examination of tea, for the purpose of detecting impurities, should be undertaken on landing by the Customs, and that all tea found to be seriously adulterated should not be admitted for home consumption. The Chairman of the Customs admitted that such an inspection of tea in bond could be undertaken by the Custom House officers, and that the great bulk of the tea would require but a brief examination by good practical officials, while suspected samples could be analysed at the laboratory at Somerset House. Your committee recommend that this examination should be made, as they believe it would practically stop the sale in this country of tea adulterated abroad, and relieve the retail dealer from the hardship which now arises from his being held answerable for certain manipulations of which he may be wholly ignorant.

MILK.—The evidence before your committee points to the fact that previous to the passing of the Act of 1872, milk was very generally adulterated with water. It has since greatly improved in quality wherever the Act has been enforced, but the good results in improving the milk supply have not been attained without some serious case of injury and injustice to milk-sellers. Too high and rigid a standard has been fixed by some analysts, and no sufficient allowances have been made for the natural variations in milk. Ten per cent. of milk solids may be more difficult to obtain under certain unfavourable conditions than 12 or 14 under a more generous diet, a

warmer atmosphere, and more comfortable lodging. Not only does the quality of milk vary with the food, the breed of cattle, the time of year, and treatment of the animals, but the milk of one cow of the same breed will differ greatly from that of another, managed under a precisely similar system; and further, the first and last pint of milk which a cow gives at the same milking will present all the difference between an extremely poor and an exceedingly rich milk. Allowances should therefore be made for these natural variations, which some purely scientific chemists seem to have occasionally overlooked. It has been argued that, notwithstanding all these discrepancies, a certain percentage of solids might be agreed upon below which no milk should be considered pure. If a low standard were fixed there would be a great inducement for the vendors of really rich milk to abstract a portion of the cream without reducing the milk below the recognised standard, and, on the other hand, it might offer a premium upon the production of a naturally poor class of milk. Your committee are decidedly of opinion that the fraudulent abstraction of cream should be punishable; at the same time they consider the sale of skim milk should be encouraged, as it is certainly a nutritious and valuable article of food; but your committee are unanimous that the sale of *skim* milk for *new* should decidedly be regarded as a punishable offence.

BUTTER.—Butter is often imperfectly made in the United Kingdom, and sometimes contains too much water, and now and then an unfair proportion of salt, beyond this, it does not appear that adulteration is much practised in this country. Certain foreign butters are mixed with lard and other fats, and there is reason to believe that salt and water, after the butter comes from the farmer, are added in some manufactories abroad. Attempts are being made in France and elsewhere to manufacture artificial butter, chiefly from the fat of animals; if these articles are composed of wholesome materials, and not sold as butter, your committee see no reason to forbid their sale. The slight colouring matter occasionally added to butter, cheese, &c., should not, in the opinion of your committee, be regarded as an adulteration.

BREAD.—Bread, on the whole, appears to be fairly pure. Potatoes are used to help fermentation, and rice flour is employed in dusting the loaves. No doubt the chief adulteration is alum, and evidence was adduced showing the great difficulty which the best chemists experience in discovering minute quantities of alum in bread.

MIXTURES.—Your committee have had under their consideration the sale of mixed articles of food and condiments; amongst them great prominence has been given to mustard and cocoa. The evidence tends to show that these articles have been sold pure, as well as mixed with other ingredients, to suit the requirements of consumers. And it has also been demonstrated to the satisfaction of your committee that the compounds are frequently made quite as much to suit the public taste as to increase the profit of the manufacturers, inasmuch as by using a lower quality of mustard seed or cocoa bean, a pure article may be made at a lower price than some of the mixtures. For this reason the statement of the proportion of each ingredient used could not be any real protection to the consumer, and should not be required. It is due to the manufacturer to record that mixed mustard and prepared cocoa are and have long been manufactured at the Deptford-yard for the supply of the navy. Your committee therefore come to the conclusion that the sale of such mixtures or compounds is allowable, and indeed needful to meet the public requirements, provided the fact of their being mixtures is plainly indicated to the purchaser by a legible label or notice conspicuously attached to the outside of each package in which, or vessel from which, such mixture is sold. A verbal declaration at the time of sale is impracticable, and if practicable would be unnecessary, when a proper label is used.

CORN FLOUR.—The attention of your committee has been called to the article known as corn flour, in reference to which important evidence as to its purity and its useful dietetic qualities has been given by some eminent medical and chemical authorities, which, however is denied by one witness. Your committee are fully convinced that the manufacture is quite legitimate, and that like arrowroot, sago, and other starch foods, corn flour is perfectly wholesome, but that it should not in any case be given to infants without a considerable admixture of milk.

WINES, SPIRITS, AND BEER.—The adulteration of wines, spirits, and beer has not been extensively examined under the act of 1872. The Licensing Act, which was passed in the same year, contained special clauses against the adulteration of these articles. The evidence before your committee is of a negative character, and it may be that alcoholic drinks have slipped through between the two acts. The adulteration clauses in the Licensing Act are sought to be repealed by a bill that has just passed the House of Commons, and there appears to be no reason to doubt that if this act is amended as your committee suggest, it will contain ample powers for detecting the adulteration in drink as well as the food of the people. Witnesses have stated that spirits are largely diluted with water, but are rarely adulterated with sulphuric acid; that almost all wines are more or less "fortified" for the English market; and the water is often added by the publican to beer and porter (perhaps with an addition of salt or sugar), but few of those villainous compounds with which malt liquors were formerly much adulterated have been recently discovered by any analysts. There was a singularly unanimous expression of opinion from many scientific witnesses as to the baneful and maddening effects produced by the consumption of very new and roughly distilled spirits.

Several witnesses have complained to your committee of the manner in which the cases under this act have been tried before justices. They state that, in some instances, the magistrates, considering the prosecution to be a criminal one, would not allow the defendant to be examined. Your committee believe that, in all cases, this privilege should be accorded the accused and his wife. Your committee also think that when a retail dealer, charged with adulterating an article, shall produce evidence that he bought the article under guarantee from a wholesale dealer, and that he sold the article in the same state and condition as he received it from such wholesale dealers, it shall be lawful for the magistrate, upon the retail dealer giving security for costs, to summon the wholesale dealer, as well as the retailer. In some cases, magistrates have declined to allow any other analysis than that of the analyst appointed to act for the district to be taken as evidence. Your committee think that evidence from well-established analysts should be allowed to be produced for the defence, and they suggest that when cases of dispute arise between the chemical authorities, there should be some court of appeal to settle the disputed points. It has been suggested that such an authority might be easily established at the laboratory of Somerset House, and the official witness from that department gave your committee to understand that, with a little enlargement and assistance, the existing laboratory and staff could undertake these important duties. In the absence of further information as to any better appeal, your committee suggest that where the analysis of the chemist of the local authority is challenged, the sample which is the matter of dispute shall be analysed at the laboratory of Somerset House, and the decision arrived at there be regarded as final. It was stated to your committee that some justices would not accept the analysis of the chemist of the local authority without his presence in court; others insisted on his signature to his analysis being duly witnessed, and in all cases it appears that the inspector is bound himself to deliver the sample of goods to the analyst. This, besides taking the inspector for two days from his legitimate duties, entails considerable expense upon the local authority, in the case where the analyst resides outside the district, or where one gentleman holds several appointments. Your committee consider that if the sample is duly secured, and properly sealed, it may be sent by post, or by other safe means; and they are of opinion that the analysis of the chemist of the local authority should be received in evidence without his presence being necessary, unless the defendant should demand the personal attendance of such analyst. There does not seem to be much necessity for attestation of the analyst's signature, nor is it apparently required by existing acts, but in any case your committee consider that the practice that proper forms for the analysis of different articles should be issued by some central authority, so as to secure greater uniformity and more detail in these documents in all courts of justice. Many witnesses have declared that the failures and hardships in carrying out the act have been chiefly due to the incompetence and inexperience of the analysts. Your committee, whilst refraining from endorsing this wholesale condemnation, admit that some of these gentlemen appear to have evinced more zeal than discretion in carry-

ng out their novel and difficult duties. In some cases indeed a decided want of chemical knowledge has been proved, but no more than was to be expected from the sudden call made for the services of adepts in a branch of chemistry which had not previously been very highly valued. Witnesses testified their belief that few really competent analysts were at present to be found in this country, and one eminent chemist stated he did not think more than "a dozen such men existed;" but, as chemical analysis will now be better taught and better understood, there seems to be no reason to doubt that in a few years there will be an abundant supply of reliable scientific analysts. In the meantime, it seems to your committee that small districts should be as much as possible consolidated; that, as a rule, the boroughs in a county should be united with the county for the purposes of appointing one analyst for the entire district, and that the only way of securing the services of really efficient analysts is to offer them a fair remuneration, which can hardly be done without the union of several local authorities in one appointment. To the Local Government Board has been confided the power of revoking or confirming the appointments of the analysts; but without any recognised authority to guide them (beyond the long list of testimonials which seem always forthcoming), the board have not the means of performing satisfactorily the task imposed upon them. Your committee think some practical test might reasonably be required from the analysts to prove their competency to perform the duties of their office. Evidence has been offered to your committee that the requisites for a thorough examination of the knowledge and skill of the analyst exist at the School of Chemistry at South Kensington; and they suggest that the local government board should have the option of calling upon the analyst for a certificate of having there passed such an examination. Complaints have been made by the metropolitan vestries that the fines inflicted under the act are paid to the General Police Fund. Your committee think that the act of 1860 intended that the fines should be paid to the vestries, and they are of opinion that it is only reasonable the fines should go to the local authority which has had the trouble and expense of enforcing the act. Your committee consider that inspectors, when traders refuse to sell them articles which are exposed for sale, should be

empowered to take samples of goods they suspect to be adulterated, upon tendering payments of the full value of the article. That in all cases the inspector should leave with the trader a duplicate sample of the goods he intends to have analysed, properly securing and sealing the same in the presence of the vendor; and that in no case shall more than one month elapse before the result of the investigation is made known to the trader. Your committee suggests that the two acts to which this inquiry refers, viz., the Adulteration Acts of 1860 and 1872 (23 and 24 Vict. c. 84, and 35 and 36 Vict. c. 74), should be repealed, and another act, consolidating and amending these statutes, substituted for them. That in the new act besides the changes already recommended, it should be provided that the fraudulent abstraction of important properties of any commodity should be a punishable offence, but that a distinction should be drawn between this and the fraudulent or noxious addition of ingredients, which more strictly speaking constitutes adulteration; and that clause 9 of the act of 1872 should be so far modified as not to make it incumbent on the analyst to give a certificate, except when he finds the articles submitted to him to be adulterated or debased. They further recommend that the act should be made compulsory.

In conclusion, your committee believe it will afford some consolation to the public to know that in the matter of adulteration they are *cheated* rather than *poisoned*. Witnesses of the highest standing concur in stating that, in the numerous articles of food and drink which they have analysed, they have found scarcely anything absolutely injurious to health, and that if deleterious substances are occasionally employed for the purposes of adulteration they are used in such minute quantities as to be comparatively harmless. Your committee believe that it is the intention of Parliament that consumers should be protected from frauds, and that they should be enabled to procure the articles they ask for and require. But your committee do not consider that parliament desires needlessly to hamper or fetter trade, still less to interfere between the buyer and seller with the view of regulating prices, or attempting to assist the consumer in ascertaining the real money value of any marketable commodity.

THE POTATO BUG.

The potato bug—the veritable Colorado potato beetle—is in our midst. Charles H. Moore, of Washington Mills, brought to us in a bottle on Saturday a handsome beetle which Roswell T. Eastman had caught upon the farm of Andrew J. Green, in the town of Paris, just over the New Hartford line. Our correspondents in the neighbouring counties report the approach of the beetle; and in order that our readers may know how to recognise the wandering insect and give him a warm reception, we enter into a brief review of his character and prospects, and of the materials which bring ruin upon his constitution. The Colorado beetle is an insect built something upon the "lady bug" model, but several times larger. He is striped after the cucumber bug style. An observing writer describes the insect as follows: "Imagine a grain of coffee, pulled up on the convex side, widened considerably, covered with a tough, shiny, yellow skin, with a row of black spots on either side; a small head, armed with strong claws, stuck on one end just behind; and underneath it the strong, short legs that drag the ponderous, humped body; and you cannot fail to know the hateful creature at sight."

Concerning the history of the Colorado bug, Walsh, the State-entomologist of Illinois, has written: "The Colorado potato beetle has been known to exist for nearly fifty years in cañons of the Rocky Mountains, feeding upon a wild species of potato peculiar to that region. When civilisation marched up to the Rocky Mountains, and potatoes began to be grown in that region, it gradually acquired the habit of feeding upon the cultivated potato. In 1859, spreading eastward from potato-patch to potato-patch, it reached a point one hundred miles west of Omaha. In 1861 it invaded Iowa, gradually in the next three or four years spreading eastward over that state. In 1864 and 1865 it crossed the Mississippi. In 1868 it reached Danville, Indiana; thus passing eastwardly at the

rate of about sixty miles a year. In 1869 it reached Ohio. In 1871 it made its appearance at Marietta." Since this date the insect has moved gradually eastward, and this summer finds it in our midst. In this section it comes late, and can probably do little damage this season; but if measures are not promptly taken, next spring will find the vines covered and the crop ruined.

Concerning the speed with which the insect produces its kind, Walsh says, "There are three broods of larvæ every year, each of which goes under-ground to pass into the pupa state, the two first broods coming out of the ground in the beetle state, about ten or twelve days afterwards, while the last one stays under-ground all winter, and only emerges in the beetle state in the following spring, just in time to lay its eggs upon the young potato-leaves." Mr. Walsh was the first person in the United States to breed the Colorado bug from the egg to the beetle, and found that it required less than a month to pass through its changes. The lateness of the appearance of the bug in this vicinity would lead to the inference that it will devote the time to a brood which will be ready for business early next spring. Next spring we may expect to see what an Illinois gentleman describes as follows: "They were found all over the county by the 10th of May, 1872, so numerous as to attract the attention of persons to whom the beetle was unknown. Its yellow eggs, in patches from twenty to forty, were soon found on the under-side of potato-leaves. By the 26th of May the larvæ were coming forth, and at this date the potato-fields were covered with the filthy, slimy-looking vermin." It is the larvæ that are the most greedy eaters, and from them comes the greatest injury to the vines. Although there is a probability that this year's crop will not be materially affected, a moment should not be lost in crushing out everything that promises next spring's growth. Fowls and birds will not touch the grubs; but it

has foes, and of these Walsh says: "Over twenty might be named. In the egg state the Colorado potato bug is preyed upon by no less than four distinct species of lady bug. The eggs of lady bugs greatly resemble those of Colorado potato bugs, and scarcely distinguishable except by a smaller number being usually collected together in a single group. As these eggs are often laid in the same situation as those of the potato-feeding insect, care must be taken by persons who undertake to destroy the latter, not to confound those of their best friends with those of their bitterest enemies." But the greatest reliance must be placed upon the war which the potato-grower is able to wage upon the insect with pressure and poison. The Western farmers have given much attention to this matter. One of them sends to the *Germantown Telegraph* his "remedies," as follows:

1st. Have rich soil, well prepared.

2nd. Plant early varieties only, in March, and thus have to fight but one generation.

3rd. Pick off and destroy beetles and eggs every day.

4th. Use Paris green, one teaspoonful to a common wooden bucketful of water, sprinkled on the tops as soon as the larvae begin to hatch.

Another Western potato-grower furnishes the same journal his method, as follows: "I use plaster, or gypsum, and mix about one part Paris green to twenty parts plaster, and

sprinkle or dust it over the vines just as soon as the bugs appear. If there is no dew or rain, I sprinkle the vines with a watering-pot, and then dust on the mixture. I claim that in this way the old beetles may be killed and the depositing of the eggs prevented. This is on the principle that prevention is better than a cure. As they travel constantly and are continually putting in their appearance, so must the poison be on the vines constantly, as long as any of the enemy is to be found. The plaster is an excellent fertiliser for the potato, and the poison is no injury to the plant or tubers. Good, clean ventilation is indispensable; for these vermin will deposit their eggs on weeds, grass, or anything they happen to fasten to. I have picked them six or seven years, and know all about the trouble it is; and my experience is practical, sharp, and sure, and the least trouble and expense of anything I have heard of. Don't wait to see the bunches of orange-coloured eggs, but don't let any be laid; and don't plant any more potatoes than you can keep free from these very unpleasant visitors."

We cannot urge too strongly upon potato-growers the necessity for close observation of their vines, and immediate war upon the bugs, if any be found. In this way next spring's danger may be lessened, and every bug killed this summer will be a marked decrease of next season's supply.—*The Utica Herald*.

A DISBANDED GRANGE.

The Good Hope grange of McDonough county, Illinois, on the Chicago, Burlington and Quincy railroad, have just held a meeting, and almost unanimously resolved to disband, surrender its charter and dissolve all its relations, social, business or political, with the State and national grange organisations. The Good Hope grange has been one of the largest and most promising in the country. It has not voted itself out of existence without substantial reasons. These reasons were clearly stated in a series of resolutions:—

1. That the original principles for which the organization was instituted have been entirely overlooked and ignored, in that the officers have assumed powers that are tyrannical, arbitrary, and entirely subversive of good order in the lodge and in the community; that the officers composing our grand or State organization are not the true representatives of the members of the order selected for that purpose, being ex-officio members of the same; and also, that the officers of the national grange have arrogated to themselves—and that, too, under the workings of the order—unwarranted and systematic autocratic authority, ruling as with a rod of iron, from whose edicts there is no appeal.

2. That large sums of money have been (and now, and in time to come) collected by the several State granges and the national grange, for which no adequate return has ever been realised by the individual members of the order.

3. And further, there has been, from time to time, through the State and other officers of the order, a disposition to change the organization from its original plan of mutual benefits to the members thereof, to that of a political party, thereby injuring and destroying all that was calculated to unite and elevate the community it was designed to benefit.

4. It is burdensome and expensive to the members of the order, without adequate compensation for money expenses; that it is now engendering a spirit of class legislation, mutual distrust between the agricultural and commercial intercourse of the land, thereby demoralising and debasing the standard of relations the community bears to each other. And further, that the order, as ruled by designing men connected therewith, has been entirely prostituted from its original purpose and brought into subjection to further their personal and political interests—to all of which we do most sincerely and emphatically protest.

The dissatisfaction expressed in the foregoing resolutions is not of a local or of a temporary character. The grange which passed them, has thus early had an experience which accords most strikingly with the predictions which were generally made regarding this organisation of the farmers in the early stages of the movement. Undoubtedly the rank and file of the grange enrolled their name upon its books and took its oath of secrecy in the utmost good faith, and with the sincerest convictions as

to the benefits that would accrue to them in their social and business relations. The members of the Good Hope Grange discover from experience, that these benefits are of a fictitious and impracticable character. We learn from various sources that one of the avowed objects of the grange—the securing of a uniform market for farmers' produce and the purchasing of their supplies through agencies at reduced rates—is found in many localities to be productive of more trouble than profit, to be prolific of dishonest practices, and to be wholly unsuccessful in accomplishing its object. But the chief complaint of these ex-grangers is, that the officers of the organisation are men with personal and political objects to serve, and bent upon changing the character of the organisation from its original plan to that of a political party. They well say that this has a tendency to injure and to destroy; to demoralise and debase the standard of relations in a community; to engender the mischievous practice of class legislation; and to breed a mutual and suicidal distrust between the agricultural and commercial interests of the country. They seem to have become fully cognizant of the unnumbered evils that must grow out of such a condition of things. Differences grow up between people, wholly unlike political differences. One class is arraigned against another in actual hostility. One class seeks to grasp another by the throat. Pure selfishness is at the bottom of such differences. Discord and strife are their inevitable fruit. The dwellers in one community work against each other, not only in political matters, but in all that relates to society, to business, to law, and to general prosperity. The material progress of a community can receive no greater check than that growing out of such antagonisms. The grange may not yet have brought any such unfortunate development in any community. But the tendency in that direction has been plain and progressive in many quarters. In some sections it has already taken the shape of a war to the knife against the railroads. If this war is persisted in in the spirit which has thus far controlled it, it can have but one termination. That termination will be the utter prostration of the railroads. The legislative body of a State is arrayed against these corporations. The executive is arrayed against them. The courts are arrayed against them. A large class of the people are arrayed against them. Instead of being in a condition to extort and to overcharge, the railroads are unable to obtain justice; are oppressed by an organised hostility which kills their business, destroys their profits, and will inevitably lead, if persisted in, to their temporary abandonment. Such a result as this would work more evil to the people than ever accrued to them from the extortion and monopoly of the railroads. They seek to remedy one evil by creating another and a greater evil. The remedy they have devised will, in the end, work

them infinitely more harm than the injury they would correct. This has been one of the extreme consequences of the organization and misdirection of the grange. There are other consequences equally unfortunate, of which the Good Hope disbanded grange complains. The workings of the order destroy all personal independence in political matters. This is a consequence which the originators of the movement hoped to avoid. But it has come about in almost every locality where the grange has obtained a flourishing footing. It is useless to say that there is nothing of a political character in its constitution and laws. This is probably the fact. But this does not affect the result. The farmers who belong to the grange have been drawn together into a solid, recognised, definite, political movement. Adhesion to this movement is made the test of their fidelity to the grange. The Good Hope grange deprecates this political combination as a great calamity, fraught with bad results, the beginning of which we have hardly yet seen. They see no way of withdrawing themselves from an unfortunate political movement save by separation from the grange itself. We have no doubt, that as the tendencies and consequences of this political misdirection of a great class organisation become more evident, other granges will follow the example of the Good Hope. The farmers are a class of men too intelligent and too independent to long consent to bind themselves by iron-clad

covenants to political movements which do not accord with their own convictions. They esteem good citizenship above all else. They pride themselves upon the high reputation which the farmer has always borne as a citizen and as a patriot. They will be found in the end to be unwilling to sacrifice or hazard that reputation, by committing themselves in favour of political action which is in its very nature unpatriotic, because it is un-independent—because it makes the greatest good of the greatest number and of the nation, secondary and subservient to good of one class alone. We say nothing against the grange as it was originally devised. We say nothing against the good objects which it was originally intended to secure to the farmer. Those objects were legitimate and proper. But they have been lost sight of. Or their attainment has been sought in ways most improper and unfortunate. When the grange becomes a political institution managed by politicians for political ends, then it ceases to be a benefit and becomes only an injury to the farmers. Then it becomes an unfortunate and a dangerous organisation, based wholly upon class distinctions. It is because they saw this tendency so clearly outlined that the farmers who composed the Good Hope lodge have surrendered their charter and resumed their political independence.—*The Utica Herald.*

POOR-LAW CONFERENCE IN THE NORTH.

At the annual conference of members of Poor-law Unions in the counties of Durham, Northumberland, Westmoreland, and Cumberland, at the Central Station Hotel, Newcastle-on-Tyne, Lord Eslington, M.P., the president of the conference, was in the chair. There was a large attendance.

The PRESIDENT said they were met, in pursuance of that which he was very glad to observe had become an annual custom, to discuss various matters of a particular character and of vital interest and importance to the most dependent classes of the community. It was a very high function, and he was very glad to see a very considerable assembly of, he believed, thoroughly practical men, who were prepared to bring to bear their knowledge and experience upon the discussion of that great crop of questions which might be summarised under the head of Poor-law administration. He attached the greatest possible value to these conferences, because they were the means of bringing together thoroughly experienced and practical men who came to compare notes, and, if he might speak in Parliamentary fashion, report progress on the various matters which he believed they were prepared to discuss. He wished to express his thorough concurrence in their utility and value. He thought it was of more importance now than usually that this conference and others throughout the country should be held to discuss some of the questions which bear on our paupers, and there were essential reasons which he, coming fresh from Parliament, would, with their permission, shortly lay before them, why this was an opportune time for a conference of this nature. Since they had met, some very important, and he might say large, steps had been taken by Parliament, steps with which he might be supposed to be more or less acquainted, in promoting the great objects that they had in view; and he would very briefly allude to them, in order that they might be *au fait* to what had been passing in the Imperial Parliament on these subjects. First of all, since last they met, a very important Commission, very ably composed, which sat for three years, had presented a report—namely, the Friendly Societies Commission. That was one of the subjects in which, he knew, they all took a very deep interest. The report was of a very lengthy, most able, and exhaustive character; and it required a very strong digestion indeed to digest all the matters contained in it. He had had an opportunity of only cursorily examining it. He might remind them that a bill embodying the main recommendations in that report was presented to Parliament, and the main provisions of the bill were to this effect: To strengthen and improve central machinery. It proposed to divide the country into forty or fifty registration districts, and to appoint in each district deputy-registrars. It proposed, too, this very important feature—a recommendation to publish correct tables of "premiums" and "benefits" based upon reliable statistics and calculations, for the use of industrial and

provident societies, charitable societies, scientific and literary associations, trades unions, and loan societies; to encourage and as far as possible enforce a system of periodical valuations at least once in five years; to promote an effective audit and appoint a competent staff of auditors; and last, but certainly not least, to consolidate in one bill the existing statutes regulating those most valuable institutions. There was only one clause to which he wished to make a short allusion. There were clauses in the bill which he confessed he viewed with the greatest possible dislike—those which proposed to prohibit the insurance of any payment on the death of a child under three years of age. Now, it struck him, when first he looked at the bill, that this clause contained a very unwise and certainly a very unmerited stigma upon the working classes of this country. He might be single in the opinion, but he certainly should feel it his duty to oppose any such provision as that in any future bill; for he believed, as he had said, that it contained a stigma certainly not intended, but certainly not deserved. He believed a very unfavourable impression had been created in the minds of the industrial classes of this country by that clause. There would be strong and good reasons given for excluding or limiting to some extent the assurance of young lives, but to prohibit it absolutely altogether would be an injustice, and, as he had said, an unmerited reproach to these classes. That bill was very wisely withdrawn by the Government. In the first place, there was not time for its consideration, and it was felt that a report of so exhaustive a character ought to be thoroughly understood and digested by the country before legislation was proceeded with, and he thought, as this matter had been relegated to another Session, it was most important that at this and similar conferences the subject should be most thoroughly discussed. To go on to what had occurred in Parliament this year, they had passed—and it would be law in two or three days—the Sanitary Laws Amendment Bill, which was also a subject deeply interesting to most of them. That bill was chiefly a bill of detail for explaining, amending, and extending the Public Health Act of 1872, and there were one or two very important clauses in it. The 20th clause was a most important one, because it empowered the Local Government Board to enforce any order of their own against a defaulting sanitary authority by writ of *mandamus*. Clause 21 was also an important clause, because it compelled the urban sanitary authorities to cleanse their streets, ash-pits, privies, &c., under heavy penalties upon the neglect of such duties. Clause 22 and some of the following clauses were still more important, and better understood by them than by him, for he was sorry to say that it was a subject with which he was very imperfectly acquainted. They were clauses to regulate the constitution and election of the Local Boards. They would

see by this short allusion that it was mainly a bill of detail, intended to carry forward the work of the great sanitary legislation of which we had heard so much, and it was chiefly important because it was, as described by its promoters, a consolidation of the Public Health Acts and sanitary laws, and he was sure he should receive the assent of every member of this conference when he said that such consolidation was very much needed indeed; for he believed the whole of our sanitary laws were in a condition of very great confusion, and extremely perplexing from that very fact. They wanted codification for those who had to administer them in the country. There were two very important subjects which had been dealt with already in the present Session of Parliament, and only on Thursday last the Home Secretary proposed to the House of Commons—and he was happy to say it was unanimously agreed to—such alterations in their standing orders as should require the promoters of railway bills and other great public works to furnish the committees of Parliament precise information as to the number of dwellings of the poor removed by such operations, and as to the facilities for providing accommodation elsewhere, and giving to such committees the discretion to provide such accommodation. He looked upon that as a very important step now taken by Parliament. It had reference chiefly to London and other large towns. He always had believed that there was no greater injustice under the guise of promoting public welfare than that enterprises of this kind, which were intended to benefit the wealthy and the great trading communities—shopkeepers, &c.—should be made at the expense of the poor, and that they should be disposed wholesale under these great Improvement Acts. He had always thought it a grievous injustice, and he knew it had been so felt, and now Parliament had taken an important preliminary step to take care that ample accommodation should be provided for the poorer classes if their dwellings were removed. He passed on to another great branch of their subject, namely, local finances, and here an important step had been taken in a late Session of Parliament. They had heard of, he would not call it a new Rating Bill, for it was a very old one, though it had never passed into law until now, and it was perhaps more accurate to define it as the Exemption Removal Bill. He looked upon it as in the right direction, for it was hardly necessary to remind them that all exemptions were necessarily unjust, inasmuch as the exemption of one class of property meant the increase of taxation to another class. If you increased the area of assessment, you naturally and necessarily relieved *pro tanto* the individual ratepayers, whereas by exempting property you increased the burden that ought to be borne by the ratepayers. Therefore, the Exemption Removal Bill, expressly for the purpose of removing the exemptions, was, to his mind, a step entirely in the right direction. Another and still more important step had been taken with reference to the great question of local taxation by the present Parliament, for the budget of the present year contained proposals to apply annually a sum of £1,200,000 in aid of local taxation, and a portion of it had been expended in increasing the grant voted for the maintenance of the police, and another portion was to be devoted in aid of the maintenance of lunatics. There was also a considerable amount of contribution to local rates in respect to Government property, amounting in the whole to £170,000, under the budget of this year, in addition to the £60,000 which had been vested in previous years in respect to Crown property in aid of local rates. £1,200,000 to local taxation seemed a very trivial sum, and was in itself a very trivial sum; but the principle involved in this was a most important one, because this was the first time that Parliament had thoroughly recognised the principle of imperial aid to local taxation raised for national purposes. That was a great principle for which many of them had contended in Parliament for several years. The principle was capable of extension in the future, and he hailed it as an imperial step in advance as a matter of justice, namely, that the imperial funds should contribute, in part at any rate, in aid of local taxation raised for national purposes. He would, with their kind permission, make a very few observations more in reference to the general question of poor-law administration. The remarks he had made hitherto had been to point out that Parliament had not been altogether careless of the local interests of the country during the present session, and, as he had already explained to them, some very important steps had been taken in reference to many of the matters which would occupy their attention. In regard to the general subject, he

took it that the objects sought to be attained by a proper administration of the poor laws were mainly three. First of all, how best they could check pauperism; secondly, how best they could relieve want; and thirdly, how best they could promote thrift. He took it these were the three great objects to be attained, and in dealing with them it appeared to him necessary that they should draw in their own minds a very clear distinction between pauperism and poverty; for they appeared to him to be two totally different things. Pauperism was a weed—if he might use a strong expression, and there was no expression too strong—a weed of noxious growth which flaunts itself in our very faces, in our streets, in our highways, in every sort of obtrusive form. He thought they should devise stringent and—he would go a step further—stern measures to repress it. But poverty was a very different thing. Poverty was a visitation of the Almighty, which he thought they were bound to deal with kindly, gently, and mercifully. Poverty was a silent, patient thing, and a suffering thing, and it was to be sought out in secret places. It was too often unknown to the relieving officers, and it was to be sought out in secret places by agencies beyond and outside the expensive Poor-law machinery; and it had always appeared to him, looking at it in this light—and he thought they would admit that there was justice in the comparison—looking at it in this light, he had never been able to see good reasons why the Charity Organisation societies, and the Charitable Aid societies, which were doing and working so well in all parts of the Metropolis, to his knowledge, should not, with advantage, be brought into co-operation with those who administered the Poor-law. He did not think there would be any jealousy between them, for he believed they might serve one common purpose. He had endeavoured to describe, under these two heads, the checking of pauperism on the one hand, and the relief of poverty on the other. But these were all questions for their consideration; he merely threw them out as suggestions for discussion. Well, then, they came to the next head, how best to relieve want. Now, it appeared to him that if they were to deal with poverty in a kind and lenient manner, that there was considerable necessity for an alteration in the system of the workhouse itself, and, therefore, he noticed with great satisfaction that on the paper that was one of the subjects put down for discussion. He thought that a somewhat different classification from that which had as yet existed was necessary within the workhouse itself for its members, and there was only one thing he should like to allude to, and that was a rule which he hoped did not exist in all workhouses, but which he knew existed in some—and it appeared to him to be a most arbitrary and cruel rule—that the aged and infirm married couples were *ipso facto* separated from each other after living together perhaps 50 years. He did trust that, under an improved system of workhouse accommodation, they would have an improved classification of its inmates into what they might call two parts—they might have that which would be a penal department, and a department which would render the workhouse no longer an object of dislike to deserving and aged poor, but an asylum of comfort in their latter days. He thought that that was a very necessary change, and these were all matters that they would discuss. In regard to the whole question of relief, he was perfectly convinced that it was impossible to lay down a hard and fast rule. He believed the cases were so different, and the circumstances surrounding them so various, and beyond the control even of the best-intentioned men, that a discretion must be left to the guardians themselves to deal with each individual case; but one thing he would say, that in order to repress pauperism it was absolutely necessary that each case should be considered strictly on its own merits, and with a view of doing this he could conceive no economy more mistaken and mischievous than that which would seek to starve the relieving staff in any Union, more especially in urban or crowded places. It was necessary to have a strict investigation into each individual case. He would only say this much with a view to the efficiency of the workhouse itself, which was really the only true check, with careful investigation, that they could place on the growth of pauperism. He had seen some remarkable instances of late. He would tell them one, and that was that, at a meeting of St. Pancras Guardians only last week or the week before, out of 174 applications for relief, the workhouse being made the test, only 18, or less than one-ninth of the whole number, accepted the workhouse as a condition of relief. That to his

mind was a very startling proof of the efficacy of the workhouse test when applied, as it ought to be, in the case of every able-bodied pauper. He might be told that, after all, these sentiments of his were mere truisms; that they all knew that, and that they were the principles on which they tried to act. But if they were truisms, how came it that they were collected there to discuss the various means and resolutions which their knowledge and experience suggested to their minds for the improvement of our Poor-law administration? He believed that that system was very far from being perfect at the present moment, and it was only by bringing different minds and different experiences upon these subjects that that improved administration could be reached, and therefore it was that he laid such value upon this conference. There was one more head—how best to encourage thrift. He knew that there was a scheme which had been very often advocated at their own conference (where it had been ably urged by his friend Mr. Wallace) and elsewhere by very influential persons. The scheme simply was to create a great national provident fund. Now, he was bound to say, fairly and openly, that it would take a great deal more discussion, much more careful consideration than this scheme had ever yet received, and much weightier arguments must be adduced before he personally should be prepared to throw in his adhesion to any such scheme. For what was the fact now in regard to these friendly societies? It was estimated that there were no less than 32,000 societies of this nature. There were four million members enrolled, and four millions more in the shape of widows and children, and the female relatives more or less intimately connected with this vast organisation, which was based on the highest principles which could actuate a people, viz., independence and self-reliance. He thought that Government interference should be a minimum and not a maximum in regard to those valuable associations. In addition to the eight millions of persons more or less intimately connected either as members or recipients with the funds of these associations there were no less than eleven millions of money subscribed. If a great central fund were to be established as proposed, it must be under the guarantee of the State, and under the management of Government officers; and if Government management was to supersede local management, they would open the way to a considerable amount of fraud, possibly, at any rate to a considerable amount of waste. He did not believe that it would be possible by any Government machinery that they could invent a substitute for that close supervision which every one could exercise over his neighbour in a locality. He believed that was of essential importance, and he was extremely loth and most unwilling to sacrifice the amount of independent feeling which they created and fostered among the working classes; and last, but not least, that which was a very important feature in these organisations, namely, the self-education which they furnished to the humbler classes of the country. And all this would inevitably be in very great danger if they substituted central and Government machinery for the local management which now conducted them. He was quite willing that Government should go this far—that they should increase, or rather extend, the system of life assurance, and facilitate the creation of life annuities among the industrial classes of this country. He was quite willing that Government should go this length, and even anxious that it should go a step further; and he believed, from the best information which he could obtain, that Government were prepared to move in that direction, namely, to facilitate the obtaining of Consols by dividing one hundred into small sums. The Chancellor of the Exchequer had expressed himself in favour of this scheme. But he was opposed to the Government mixing itself up with what was called sick and burial business, which local societies provided for. He was quite ready that Government should extend the system of life insurances, and extend and facilitate the obtaining of deferred annuities or small sums in the Consols by the working classes. And why did he say this? Because it appeared to him to be the highest stroke of public policy to extend through the whole body corporate an interest in the stability of the public funds of this country. He believed that to be more worthy of the highest statesmanship, because it would give to every man in the country, from the highest to the lowest, a stake in the country, and give the greatest amount of security that could be given to its interests. These were his views, and he was very thankful for the patience with which they had listened to him. He had expressed himself strongly

upon one or two points of general principle, but had not attempted to deal with detail; but they were perfectly competent to deal with it, and to give the result of their experience and practice in the administration of the Poor-law. He had merely thrown out certain points, which he trusted might commend themselves to their consideration, and receive at their hands some discussion.

Mr. JAMES CROPPER (Kendal Union) read a paper on "What accommodation is essential in a workhouse to enable guardians to carry out an efficient administration of the Poor-law, and to meet the present requirements of the Local Government Board." A long discussion took place, in which the Secretary (the Rev. J. Elphinstone Elliot), Mr. Heatley (Alnwick), Mr. Thompson (Berwick), Archdeacon Hamilton, Mr. Wallace, Mr. Hedley (Inspector), the Rev. Dr. Simpson (Kendal), Captain Johnson (Brompton), the Rev. W. L. J. Cooley (Alnwick Union), Mr. Dods (Hexham Union), Mr. Ridley (Hexham), and other gentlemen took part. The principal points discussed related to the separation in the workhouse of aged married couples, which was generally condemned; the education of pauper children, several of the gentlemen stating that in their union the children were sent to the national or other schools with no distinctive clothing; the use of wine and spirits, which, contrary to general wish, the medical officers usually recommended for pauper patients instead of medicine, the medical chests being suggested as means of remedying the evil; the place for pauper lunatics—the workhouse in preference to the lunatic asylum being disapproved of; the treatment, and, as Archdeacon Hamilton termed it, the "sorting" of vagrants; and generally the material and out-door or labour arrangements of the workhouse.

The PRESIDENT, in some observations at the close of the discussion, said that with their permission he would read them a passage which would interest them when they knew the source from whence it came. It was a short passage with reference to the relief of a famine, and if they would kindly follow him they would see that the principles laid down were the soundest and justest principles for workhouse administration which they could follow. It was written in reference to the relief of a famine in India: "The principle of the mode I propose to relieve the distresses of the inhabitants is not to give grain or money in charity. Those who suffer from famine may properly be divided into two classes—those who can, and those who cannot work. In the latter class may be included old persons, children, and the sick women. The former—viz., those of both sexes who can work—ought to be employed by the public; those who cannot ought to be taken into an hospital and fed, receive medical aid and medicines at the public expense; suitable buildings to be provided for this purpose. According to this plan subsistence will be provided for all. The public will receive some benefit from the expense incurred, and, above all, it will be certain that no able-bodied person will apply for relief unless he shall be willing to work for his subsistence; that none will apply who are able to work, and who are not real objects of charity; and none would come for the purpose of partaking of the food which must be procured by their labour, or to obtain which they must submit to the restraint of an hospital." These words were written seventy years ago in Bengal by no less a man than the Duke of Wellington. He had ventured to quote them because, *mutatis mutandis* they contained the principle of workhouse administration they had been discussing. They were interesting from the source from which they came, and instructive for the valuable principles they contained.

Mr. B. C. BROWN read a paper on "Self-help and Poor Relief," which gave rise to a discussion as to the best means of encouraging provident habits among the artisan and agricultural classes, and as to the mode of dealing with those applicants for relief who were reduced to poverty in spite of industry and prudence.

The conference then adjourned until the following day, when the sitting was resumed.

Mr. R. BURDON SANDERSON read a paper on "The Engineering Necessities created under the operation of the Public Health Act." Recent legislation, in imposing upon boards of guardians under the new name of Rural Sanitary Authorities the charge of the public health of their unions, had rendered it their duty to pay attention to and provide for the following matters: The removal of refuse, solid and liquid, injurious to health in such a way as to be innocuous, and the provision of proper water supply where it did not exist, with the supervision of that at present in use. To these must

undoubtedly very soon be added some control over the erection of human habitations so as to secure proper dryness and foundations and adequate ventilation, for which urban authorities already possess large powers. The construction of sewers, the dealing with sewage, and the providing of water seemed pretty fully provided for under the powers of the very numerous Acts embodied in the Sanitary Act of 1872. But it seemed to him that that Act contained one very great omission, which it was the purpose of his paper to discuss, in not providing for an officer in whose hands alone these matters could safely be left, and by whose advice the authority could only satisfactorily act. Two executive officers were provided for—the medical officer and the inspector of nuisances. In the hands of neither of these could the construction of the works he had mentioned be placed, nor did it fall to either of their provinces to say what were the proper means of construction to ensure the qualifications in a dwelling-house which the medical officer would state to be necessary. The laws that governed the proper arrangement of sewers and house drainage were so much more complicated than many uninformed persons suppose, that they taxed even the best-educated and most experienced engineer to arrange them satisfactorily to himself and his employer. What hope, then, had they of any success if these works were placed in the hands of men of the class of most of the sanitary inspectors, who, however worthy and painstaking, had neither the education nor the means of obtaining information requisite. To show the necessity of proper professional experience being at the command of the sanitary authority, Mr. Sanderson referred to the condition of sewers, the removal of sewage, and the water supply. On the latter point, and speaking of wells, he said these receptacles of underground waste when in the neighbourhood of houses or farmsteads required the very greatest vigilance. Unknown drains or porous subsoils caused impure water and other matters from the house or farmstead to find their way into them, and without in the slightest degree affecting either the taste or brightness of the water. And what was very important to remember was this—that a well which for years had provided a wholesome water, might suddenly, either from an exceptionally wet season or drought, or from some change in the upper drainage, alter the character of its supply and become a source of incalculable mischief. Mr. Sanderson concluded by moving, “That this Conference is of opinion that the Sanitary Acts are deficient, in not providing, in the person of a special officer for efficient engineering advice, for the guidance of rural sanitary authorities in the various matters now placed under their control and imperatively requiring such advice.”

Mr. CROPPER (Kendal Union) was much obliged to Mr. Sanderson for the remarks he had made as to the economising of water, and, with regard to the pollution of wells, his own experience was very much the same as Mr. Sanderson's. Until the present Act they could not close those wells which were polluted; and, even now, he believed they could be closed only by substituting some other source of water supply. They had to find out whether the sources of water supply must be equally near the population, and whether any one could stop a well without providing another. He did not intend that a sanitary authority was to encourage or go into any system for bringing the water from a distance. He did not think that that was contemplated by the Act; but he thought they were rather intended to obviate difficulties, and to meet immediate simple interests rather than to provide the means for a large outlay.

Mr. FORSTER (Chester-le-Street) spoke of the importance of utilising colliery water by filtering beds, and suggested the employment of scavengers in colliery villages.

The PRESIDENT asked, if in the event of a colliery or coal company in the course of their mining operations depriving a district of its water supply, there was any power by law by which the company could be compelled to give a supply.

Mr. RIDLEY (Hexham): No, my Lord.

The PRESIDENT: I think there is no power at law.

Mr. RIDLEY: There is not, my Lord. I have examined it closely.

The Rev. JOHN BIGGE (Stamfordham) said he had himself lost a very valuable spring by the Whittle Dene Water Company. He took counsel's opinion upon the manner, and he was told that they could not legislate upon what went underground. There was an enormous quantity of water taken underground by the collieries and wasted, while it might be

put into the reservoirs and supply the whole of the district. A very eminent architect in Newcastle told him that he considered that every house ought to supply itself with water for domestic purposes from the roof, while the water for drinking could be obtained from other sources. He knew that in one or two houses enormous tanks were placed under the kitchen, and these houses were never without water.

Captain JOHNSTONE (Brampton) said that as far as his experience went it certainly tended to show that they could not trust such important matters as the management and engineering of water supply, which might involve considerable expense and perhaps risk of failure, to ignorant persons. But he thought the manner in which it had been met, as far as the rural districts were concerned, quite met their wants in that respect. In the event of any parish wishing to raise money on loan for the purpose of sewage or water, they were required to send in a plan designed by a competent architect, and unless the Local Government Board were satisfied of the competence of the person, they did not grant the money. That appeared to him to give them the protection which the resolution asked. He quite agreed with Mr. Cropper as to his remarks on the supplying of water, and said that in his union they were carrying out the plan of bringing the water to villages and collections of houses, and making a charge not exceeding 2d. per week.

The SECRETARY (the Rev. J. Elphinstone Elliot) made some remarks on the waste of water and pollution of springs by collieries.

A long discussion followed, the general opinion being against the appointment of a third officer under the Sanitary Authority; more especially as the Local Government would make inquiries, and, if necessary, inspect, when any important works were proposed to be constructed. The gentlemen who took part in the discussion were—Mr. Culley, inspector; the Rev. W. L. J. Cooley, Alnwick Union; Mr. Ridley, Hexham; the Rev. Dr. Simpson, Kendal; Mr. Healy, Alnwick; Mr. Proctor, Tyemouth; the Rev. G. F. Weston, and Mr. T. P. Doos.

The PRESIDENT, in closing the discussion, said he thought they could all perceive from the course the discussion had taken, that they were in the infancy of this legislation, and that the subject was so large and the Acts of Parliament so intricate and in such a confused condition, that the first necessity which was incumbent on the Legislature was to press absolutely for the consolidation of the laws; that he believed to be the most important step that could be taken in order to enable those who had to administer the law really to understand in what position they stood. That appeared to him to be the essential duty which devolved on the Local Government of this country. They were told that the Sanitary Laws Amendment Act was a step in the right direction, but it would be the duty of members of Parliament, in the forthcoming session, to press for the consolidation of these laws. He was sorry, indeed, if he should appear in any way to differ from Mr. Sanderson, because he felt that his experience deserved great weight, and he (his Lordship) professed to have very little. He must remind them that Mr. Sanderson's experience was very different from that of most others. If Mr. Sanderson had exalted notions, they were derived from his large connection in a great town. But they had to deal with simple rural districts, and he confessed it seemed to him absolutely impossible to call upon a rural union to employ a permanent engineer for the sake of his advice, and for this reason—it would necessitate the employment of at least three distinct officers. And depend upon it if they once appointed a permanent engineer his business would be to create work for himself, and that was what they must guard against. If they took good advice at first, and constructed work which would last a long time, it would be worth while to pay a competent man. But he took objection to the appointment of a permanent officer. If the law did not give them the power, they must press for an alteration in this respect. [Mr. Culley: It does.] His Lordship concluded by thanking Mr. Sanderson for his paper.

Mr. SANDERSON withdrew his motion, and substituted the following, which was carried unanimously: “That this conference is of opinion that in cases where mines or other works by their operations, can be reasonably believed to have deprived a district of its existing water supply, it should be made incumbent on the owners of these mines and other works to make good the deficiency so created.”

Mr. T. P. DODS read a paper on "The Working of the Assessment Committees," as a supplement to his paper on "Local Taxation," read before the Farmers' Club some months since. He concluded by proposing a series of six resolutions. The first resolution was "That only one-third of the Assessment Committee (who may be eligible for re-election) retire in each year."

In answer to an objection that the Boards of Guardians appointed their committees annually, and that there was no guarantee that every member of the Assessment Committee would be returned,

Dr. SIMPSON said there was no reason why the Assessment

Committee should be members of the Board of Guardians at all, and the Board of Guardians might be permitted to elect the Assessment Committee from outside of their own body. By the motion they would only express an opinion: let the Legislature discover the mode of carrying it out.

The resolution was, after a discussion, carried unanimously.

Mr. DODS next moved, "That the qualification of members of Assessment Committees be considerably raised."

The motion was generally opposed, and was ultimately negatived.

CARMARTHENSHIRE FARMERS' CLUB.

TENANT-RIGHT.

At the quarterly meeting Mr. J. Buckley, Penfai, Llanelly, president, was in the chair.

Dinner was provided at one o'clock, and after the removal of the cloth the following articles were disposed of by lot: Horse-rake, winner to pay £4 to the fund of the Club, Mr. E. Humphreys, Tremisi; sack-lifter, Mr. R. Thomas, Woodbine Cottage; stubble-rake, Mr. J. Jones, ironmouger; clipping machine, Mr. J. Thomas, Penlan; knife stand, Mr. J. Buckley, Castle Gorfod; cart rope, Mr. Harris, Pilroth; dung-fork, Mr. H. Morgan, Llwyn; dung-fork, Mr. W. Jones, Llwynygroes; dung-fork, Mr. W. Lawrence; hay-fork, Mr. J. Lewis, Gurrey; hay-fork, Mr. H. Thomas, Pante; hay-fork, Mr. Philip Lewis, Carmarthen; hay-fork, Mr. Lockyer, Carmarthen; hay-fork, Mr. T. Davies, Wernddu; hay-fork, Mr. T. Rees, Llaithdy.

The CHAIRMAN then introduced the subject for discussion, viz., "The Landlord and Tenant Compensation Bill," continued from the last meeting. He said the Landlord and Tenant Compensation Bill was taken into Parliament by Mr. James Howard and Mr. Clare S. Read, and contained some 34 clauses and schedules, and it had been largely discussed at this Club, as well as, he might say, every other agricultural club in the country. On a former occasion he stated that in the main he quite agreed with the object of this bill—the protection of tenants; for it was only right and just that the tenant should have compensation for what he left behind him in the land, and termed in this bill unexhausted improvements. He believed that if the measure was passed what was stated in the preamble would in time become a consequence, viz., the increased production of food for the outgoing tenant would not attempt to exhaust the land. It would be to his advantage, in order to secure proper valuation, not to do so, and as a result the incoming tenant would enter the farm in its full state of production, paying for what the outgoing tenant had left unexhausted. He was, however, inclined to the opinion that this bill would be far too cumbersome to effect the objects stated, and that it would be likely to entail too heavy a charge on the incoming tenant. In giving this opinion he only referred to the valuation clauses relating to corn and cake that had been consumed by stock during the last four years, and other clauses under the head of durable improvements. The 12th clause, again, which would make the Act universally binding, would, he felt sure, never be got through Parliament. Why should freedom of contract be taken from the farmer when such freedom was in the power of others? Still there were some good things in the bill, and if a simpler measure were drawn up, and introduced, providing, in all cases where there did not exist a full agreement between the landlord and tenant, that the tenant should have reasonable and substantial compensation for unexhausted improvements, such a bill might perhaps be passed, and become law. His idea was that all improvement should be classed under two heads—durable or permanent improvements, and temporary improvements, or such as the tenant would do to bring the farm into the best state of cultivation and such as, it would be to the advantage of the incoming tenant to take and to pay for. The permanent improvement, if done by the tenant, should be done with the landlord's consent in writing. The amount of compensation, too, he thought, should vary according to the party by whom notice to quit was given. If such notice was given by the landlord the compensation might be extended, if by the tenant it might be limited. He firmly

believed the legislation in this respect would have the effect of raising the productiveness of some farms, and would in a few years be found to have considerably increased the produce of the country.

Mr. W. JONES (Llwynygroes) admitted that the subject had often been discussed during the last twelve months, and hoped the effect of all this ventilation would be a good bill in the end. He did not think farmers should be in a hurry to get a measure passed; it would be better to thoroughly discuss the matter, and then no doubt the resulting bill would be something worth having. He quite agreed with the remarks of Mr. Buckley with respect to varying the compensation according to which party gave the notice to quit. The tenants ought to have compensation for unexhausted improvement, and he could not imagine why they had remained quiet for so many years. The present was the strike epoch, and he wondered the farmers did not join together and strike. He hoped to see the day when a good Act would be passed to remedy the present state of things.

Mr. DAVIES (Cincoed) advocated arbitration as a means of settling the amount to be awarded to tenants.

Mr. LEWIS (Gurrey) quoted some remarks lately made by Sir John Pakington, who held that it would be no use passing an Act giving the tenant the value of unexhausted improvements if the landlords were able to make contracts with their tenants. At the last meeting a charge was made, by a gentleman not present on this occasion, against a large landed proprietor in Wales, to the effect that a tenant of his who had made an outlay of two or three thousand pounds had been turned out of his farm without a penny compensation. He denied this statement altogether. He believed with the Chairman, that both landlords and tenants should be protected, and if a tenant left a farm in an exhausted condition he ought to pay for the exhaustion. Mr. Lewis concluded by saying that he believed the bill, if shorn of the 12th clause, would be useless. He hoped the tenant-farmers would not strike for the purpose of getting their rights, but should not be sorry to see them do so unless proper security was granted them.

The CHAIRMAN mentioned, in regard to the right of contract, that the Act under discussion was to come in where no agreement existed between landlord and tenant. The Act he had mentioned would, however, come into force in cases where there was no agreement, or in cases where there was an agreement which did not give the tenants substantial compensation.

Mr. BRODIE thought they would admit that he had taken a full share in regard to this matter at previous meetings. He had often heard children say to one another "open your mouth, shut your eyes, and see what the king will send you," and he thought the farmers might now open their mouths, shut their eyes, and see what Mr. Disraeli would send them. Mr. Disraeli attended well to the wants of the British farmer, and it seemed to him (the speaker) that it would be well to let him have a swing at this matter. He hoped the coming bill would be for the good of the agriculturists, and for the benefit of the community at large; and that it would also emancipate the land from the many old-fashioned shackles which now existed, and prevented its improvement. He earnestly hoped that Mr. Disraeli would go boldly into the matter, and gain laurels for himself that would never fade.

Mr. MORGAN (Llwyn) agreed with the Chairman that the bill under consideration was too cumbersome. There was no

doubt it was advisable to get a better understanding between landlords and tenants, the only question was how to do that. Difference in the soil, climate, &c., made it almost impossible to legislate for the whole kingdom, but they would see what Mr. Disraeli could do in the matter.

Mr. BOARDMAN (Llandilo) and Mr. JAMES approved of the bill, both arguing strongly in favour of security being granted to tenants—a course which would benefit farmers and improve the land immensely.

Mr. WARREN was then called upon, and in the course of his remarks said the question involved in the bill was a national one. There was no doubt but that insecurity of tenure paralysed the energies of any man, whether he was a farmer or not. He should like to see an Act passed providing security, and he almost believed that a bad Act would be better than no Act at all, because the effect of such an Act would be to draw the attention of the country to the matter,

and the defect would be remedied. There were thousands of acres of land in this country in a most imperfect state of cultivation, which could by means of capital and energy be brought to profitable and advantageous condition.

Mr. PROSSER, the secretary, being blessed with a good landlord, was not so much in favour of the bill. He knew, however, of farms in this country where four white crops had been taken from the land in succession, and the effect of the bill in such cases would be that landlords would claim compensation from tenants.

The CHAIRMAN, in closing the discussion, said if a good moderate bill was passed even then he did not believe it would suit all circumstances. He still thought that there should be freedom of contract between landlord and tenant, but that the tenant should have ample compensation for unexhausted improvements.

HORSE-BREEDING IN FRANCE.

The following correspondence respecting horse-breeding establishments in France has been published as a Parliamentary paper:

LORD LYONS TO THE EARL OF DERBY,
Paris, June 2, 1874.

MY LORD,—I have the honour to inclose herewith to your Lordship, extracted from the "Journal Officiel" of this day, the promulgation of the Law on "Haras" (horse-breeding establishments) and remounts in France.

I have, &c., (Signed) LYONS.

Law on Breeding and Remount Establishments.

The National Assembly has passed the Law of which the tenor is as follows:

Article 1. The chief managing body of the breeding establishment shall consist of a director-general, who shall be also the inspector-general; six inspectors-general; twenty-two managers of dépôts; twenty-two assistant managers, and an efficient number of superintendents.

Art. 2. A committee for the management of breeding establishments shall be named by the President of the Republic for nine years. It shall consist of twenty-four members, and shall be renewed every three years, by a third of its members retiring, and shall represent the different classes. Members retiring are re-eligible. It shall hold at least two sittings a-year. It shall report on the estimates of the breeding establishments, on the general regulations for exhibitions and race meetings, on the kind and amount of encouragement to be given for breeding and rearing, and on all questions which may be submitted to it by the Minister or, in his absence, by the Director-General of the Haras. The decisions of the Departmental Councils (Conseils-Généraux) as also their debates concerning the horse question shall be communicated to them. After each sitting a full and detailed report on its labours shall be drawn up, and this report shall be communicated to the National Assembly.

Art. 3. The school of the "Haras du Pin" shall be re-established. No one shall become an officer of the Haras unless he has received a diploma certifying that he has passed the final examinations of this school.

Art. 4. From the year 1875, the actual number of stallions kept by the managing body of the Haras shall be increased by 200 stallions each year, until the maximum of 2,500 shall be reached. These stallions shall be chosen from the different breeds, and there shall be as many thoroughbred stallions among them as possible.

Art. 5. Independently of the sums voted each year for race meetings, training schools, &c., the present grant of 683,000 fr. destined for prizes, shall in 1875 be increased to 800,000 fr., and after that by an annual increase of 100,000 fr. up to the sum of 1,500,000 fr., in order to provide prizes for—1. Stallions belonging to private individuals, clubs, or departments, that have been approved of by the managing body of the Haras; 2. Brood mares, fillies, and colts. A grant of 50,000 fr. shall be devoted to trials of Arabs and Anglo-Arabs.

Art. 6. The establishment for brood mares at Pompadour shall be re-established. It shall consist of sixty mares devoted exclusively to the breeding of Arab and Anglo-Arab horses.

Done in the public sitting at Versailles, of the 29th May, 1874.

(Signed) L. BUFFET, President.
(Signed) FELIX VOISIN,
FRANCISQUE RIVE,
Viscount BLIN DE BOURDON,
LOUIS DE SEGUR,
Secretaries.

The President of the Republic hereby promulgates this law.
(Signed) Marshal DE MAC MAHON, Duc de Magenta.
(Countersigned) L. GRIVART,
Minister of Agriculture and Commerce.

LORD LYONS TO THE EARL OF DERBY,
Paris, June 5, 1874.

MY LORD,—I have the honour to transmit herewith to your Lordship a despatch of this day's date from Colonel Conolly on horse-breeding establishments in France.

I have, &c., (Signed) LYONS.

COLONEL CONOLLY TO LORD LYONS,
Paris, June 5, 1874.

MY LORD,—Seeing by the newspapers that the subject of "horses" is likely to come again soon before the British Parliament, I have the honour to inclose copy of a Law which has just been passed by the French National Assembly for the encouragement of horse-breeding in general, and upon establishments for remounting the army. I shall be in a position to give further information on this subject by the next messenger, and to forward additional documents.

I have, &c., (Signed) JAMES CONOLLY.

LORD LYONS TO THE EARL OF DERBY,
Paris, June 9, 1874.

MY LORD,—I have the honour to transmit herewith to your Lordship a despatch from Colonel Conolly dated the 8th instant, on the subject of breeding horses for the French army.

I have, &c., (Signed) LYONS.

COLONEL CONOLLY TO LORD LYONS.

MY LORD,—With reference to my last two despatches on the subject of horses, I have the honour to forward the following additional documents: Law passed by the National Assembly upon breeding and remount establishments; Two days' debate on the above Law in the Chamber at Versailles; Observations on encouragement and improvement of the breed of horses in France. I now beg to offer the following remarks upon the whole question, which excites considerable attention in the French Government and throughout the country. The school of the Haras du Pin, in Normandy, re-established by Article 3 of the Law, is destined to give an education in the veterinary art, and in the judgment and management of horses, which will qualify young men who have diplomas from thence for the higher positions in Government "Haras." The utility of this school is contested by many who advocate, for such diplomas, a competitive examination open to all France. The establishment for brood-mares at Pompadour, in the Limousin, has many opponents, on the

ground of its interfering with private enterprise. A late work by M. de Croix, principal veterinary surgeon to the army, gives the following census of horses, mules, and asses in France:

Grand total in France	3,633,605
" " Algeria included....	4,000,000
They are divided thus:	
Colts and fillies under three years.....	400,454
Entire horses	351,654
Geldings	872,911
Mares	1,257,852
Mules	299,129
Asses	450,625
Among them are—	
Covering stallions	12,000
Brood mares	600,000
Which produce annually—	
Colts and filly foals	300,000

The rise in the price of horses during the last three years has given a great impulse to the breeding of them by the populations of Algeria. The debate in the National Assembly at Versailles is worth reading *in extenso* by any one interested in horse-breeding or the mounting of an army. The pith of it, however, may be extracted from the speeches of M. Bocher, reporter of the Committee, and of M. de Carayon-Latour, who is a large landed proprietor, master of hounds, and a good judge of all classes of horses. M. de Carayon is for restricting, to the utmost the action of Government in this direction, and insists that its stallions should not cover at a lower price than would remunerate a private proprietor. M. Bocher answers that this is all very well in England, but that, with the French system of subdivision of property, very few private individuals can stand the expenses of a well-founded breeding establishment. All parties agree that Government should interfere to prevent a circulation through the country of unsound covering stallions. The best remedy for such an evil consists in a heavy duty upon this class of animals, which can be mitigated or remitted where certificates are held from a superintendent of "Haras." It is also advocated that prizes should be given at agricultural meetings, horse exhibitions, &c., for the best brood mares and foals. The speakers in the

debate of the National Assembly were unanimous as to encouraging the breed of "Percherons" and "Limousins," that every good judge must have admired in the French diligences, omnibuses, and other heavy vehicles. It is seen by Article 4 of the Law that the number of Government covering stallions was eventually be raised to 2,500 instead of (as at present) 1,087, but that, by the introduction of judicious economies, the annual cost of each animal will be reduced from 2,018 fr. 90c. to 1,460 fr. 78c. The whole financial system of the bill is developed in the speeches of the Marquis de Damprière, page 3567, and of M. Bocher, page 3572 of the Debate. The late horse exhibition (spring of this year) was decidedly inferior to that of 1873. I can strongly recommend the inclosure of my despatch, "Observations by the Society for Encouraging and Improving the Breed of Horses in France," to the perusal of all of my countrymen who take an interest in this important subject. It gives a carefully prepared history of thoroughbred stock and of racing in this country, and it combats the argument that an excessive number of handicaps and of two year old and short races have had a deteriorating effect (combined with inordinate betting) as well upon the breed of horses as on public morality. Many good sportsmen in England, with whom I agree, and who are of opinion that evils of this kind have ensued from the multiplication of small race meetings, will read with impartiality this defence of the French system, which is not yet nearly as far advanced in that direction as our own. The pamphlet in question is not published for the trade, and copies of it are difficult to be procured. The military considerations which influenced the Committee are fully explained by its reporter, pages 3571 and 3572 of the Debate. When the peace establishment of the army required 70,000 saddle horses, France had to import annually from 6,000 to 7,000; that establishment is now raised to 90,000. To pass from a peace to a war footing under the new military law demands 176,000 horses, and a large proportion of them of superior quality to what was formerly considered serviceable. The movements of field artillery are now so much accelerated that many of the draught horses of that arm must come from the same class as those for the cavalry.

I have, &c.,
(Signed) JAMES CONOLLY.

WILTSHIRE BACON.

We recently had occasion to visit a small Wiltshire town which has been for many years, and still is, the principal seat of bacon manufacture. There is nothing in the cleanly, quiet appearance of the town itself to indicate either the nature or the magnitude of the trade there carried on. Though our hotel was within a stone's throw of the principal slaughter-house, we were greeted with no shrill dissonant cries of pigs in distress, and protesting in their own way against having their throats cut. There were no open sewers flowing with blood and garbage, nor blackened slums reeking with the smoke of burnt straw and hair. All was clean and orderly, as if there was no such a thing as a pig within fifty miles. The only thing which struck us as unusual was the passage of several waggons laden with huge blocks of Norwegian ice, the summer supply of fifteen hundred tons being then about to be laid in. An uniform temperature is thus secured for the curing vaults, under a system patented by the proprietors, who are thus secured against heavy losses by unfavourable weather, and also enabled to meet the constant demand for their bacon, and send it out in a comparatively fresh condition all the year round. It stands by reason that if sufficient bacon were cured during the cold weather to last all the summer months, which was the old-fashioned plan, the present system of curing would not answer, as the bacon would not keep. An immense stock must also be necessarily accumulated in the spring to meet the supply, and the consumption of the offal, instead of being equalised, as now throughout the year, would in some seasons be far in excess and in others far inadequate to the demand. Fifty thousand pigs per annum are slaughtered in this establishment, giving an average of about a thousand a week. Through the kindness of the proprietor I was enabled to see and make a note of the arrangements, notwithstanding the notice which met my eye at the entrance that there is "no

admittance except on business." I use the word proprietor advisedly, for this is no joint-stock affair, but is conducted by the skill and capital of one man, or rather one family, alone. The business has been in existence for more than half a century, and had comparatively a very small beginning, but has grown to the present magnitude through the indefatigable efforts of managers to meet the taste and requirements of the times. At first I was conducted to the shed in which the live stock are temporarily housed to await operations. There they were, comfortably nestling in clean straw, and with but little of the usual odour of the sty, a number of fine, plump, medium-sized pigs, grunting, snuffing, or growling contentedly, and happily unconscious of the fate which awaited them on the morrow. I had neither the opportunity nor desire to see them brought to the knife, but the *modus operandi* was lucidly explained to me by one of the operators. A chain is attached, by means of a noose, to one of the hind legs, and the animal is suddenly drawn up, head downwards, by means of a windlass. An incision is skillfully made in the throat. There is a muffled shriek, a copious discharge of blood from the orifice, a few convulsive kicks, and the sanguinary deed is completed. The carcase is then removed to the singeing furnace, for Wiltshire bacon must not have its hair entirely removed by scalding, after the Yankee method, or it would lose one of its characteristic marks, and consequently much of its value in the market. The old-fashioned plan was to lay the carcase on the ground in the open air, cover it up with straw, which was then set fire to, and the process continued as long as necessary, perhaps ten minutes or a quarter of an hour to a pig. This consumption of time and straw would never do on an extensive scale. A furnace is therefore contrived with a fiery aperture, into which the carcase of the pig is lifted by an ingeniously contrived lever, is there denuded of hair, and removed in

about half a minute. It is then washed and scraped clean, a gambrel is inserted under the tendons of the hind legs, and the carcass is suspended by an iron hook to a horizontal bar, which traverses the whole length of the slaughter-house, serving as a sort of tramway, having sidings and crossings along which the carcass is easily slid from one operator to another, until it is finally cut asunder and taken down. The disembowelling process comes next, the viscera, having the butcher's perquisites if the animal be bought by weight, are entirely removed; the liver, heart, &c., forming a cheap and savoury dish for a poor man's table, find a ready sale to meat pedlars, who hawk them about the country, the overplus being sent to London or the neighbouring towns. The entrails are passed down a kind of funnel to the vaults below, where they are denuded of fat, and passed on to women, who wash and cleanse them for sausage skins and "chitlings." The old-fashioned hog's pudding, composed of the blood and fat of the animal, mixed with prepared oats and savoury herbs, stuffed into the entrails, a revolting looking mass, but when boiled and afterwards toasted, a dish for an epicure, is not in so much favour now as formerly; the blood is consequently sold and highly prized for manure. The pig may now be said to be killed and dressed by a series of operations which are performed, when "in full swing," at the rate of about ninety per hour. It is next weighed, and then slit down the middle, the Lazarus, or back-bone, flake flat, head, and leg are removed, the sides neatly trimmed to shape, and they are then ready for salting. There is but little fresh meat taken from the pigs in this establishment; the spare rib is "spare" indeed, and seldom weighs more than one or two pounds. The griskin is a mere attenuated strip, composed mostly of short transverse pieces of bone. The whole side, consequently, from the abundance of lean meat in its constitution, partakes more or less of the character of delicately flavoured ham, whilst the difficulty of disposing of the enormous quantity of fresh meat which would accrue were the sides trimmed in the ordinary manner is done away with. In favourable weather the meat is cut into sausages and sent to London and other large towns, where they are readily disposed of in fresh and prime condition. At other times the meat is sold to the hawkers, or salted down to be consumed at leisure. I was next conducted to the curing department, which is vaulted over, and surmounted by the large quantity of fresh ice as before mentioned. Were it not for this contrivance, the system pursued here could not be properly carried out. Each side receives its just proportion of salt, and neither more nor less, the conditions being equalised throughout the year by an equalisation of temperature. As may be supposed, everything here is scrupulously clean. The flooring, which would otherwise be inevitably sloppy, is composed of a patent pavement, which forms a complete series of grooves and channels, and is so laid as to drain itself. Here were huge piles of hams, cheeks, and sides of bacon undergoing the curing process, which is performed with salt and finely-pulverised Bengal saltpetre alone, the use of sugar, which is only necessary to counteract excessive saltiness, being here unnecessary. The different sized sides are all arranged in separate piles, as the heavy ones require a somewhat longer time than the light ones. From the curing vaults to the drying houses, where they are either white or smoke dried, to suit the tastes of the purchaser, and then to the consumer, averages about a month from the time the pig is taken alive into the establishment. About ten millions of pounds of first-class bacon are sent out yearly, most of it finding its way to London and other large towns, where good things will always command a good price. Our sister countries, Scotland and Ireland, notwithstanding their pride in native produce, are not insensible to the charms of Wiltshire bacon, and figure largely as customers. The proprietor is thus enabled to obtain the highest price of any other curer in the world, though he has no advantage such as a monopoly of the raw material or a secret in the mode of treatment would give him. The method is open to anyone who chooses to exercise it with the same care and discretion as are here observed. We must not forget the lard, which is run into bladders and shallow tin pans, and sold by the ton to large consumers. "This is our reading room," said my guide, opening a door, and ushering me into a spacious and well-lighted apartment, well furnished with books, newspapers, and periodicals. Here the men who reside at a distance take their meals, and spend, if they are so minded, the intervals of labour. The literary character given to the apartment looks well, and shows that those who kill fat swine need not neces-

sarily be swine themselves. The proprietor is, we hear, a disciple of John Bright, and conducts his establishment as far as possible on teetotal principles. There was, however, an unmistakable odour in the room of the weed which soothes and not inebriates, which showed some amount of toleration of the weaknesses of our fellow men, inasmuch as smoking was not strictly prohibited.—*Wills Gazette*.

SLAUGHTERHOUSES ACT, 1874.—By the Building Act of 1844 certain businesses were put under regulation as offensive or noxious, as they were then carried on in a manner injurious to health. Dwelling-houses were not to be built within 50ft. from any buildings in use for such a business. If the building was destroyed or pulled down it might be rebuilt, but no new business could be established at a less distance than 40ft. from a public way, or 50ft. from a dwelling-house, and if then carried on within such distances it was prohibited to be so carried on after 30 years from the 9th of August, 1844, unless means were used to mitigate the nuisance to the satisfaction of a jury at Quarter Sessions in Middlesex, which was declared to be the *venue* for the whole metropolis. Last year those concerned in the trade of slaughtering cattle became alarmed at the existence of these prohibitory enactments, and the penalty of £50 a day for infringing them; and an attempt was made to get a repealing Bill passed, but it was withdrawn, and a Select Committee substituted to take evidence regarding noxious businesses. Those concerned in most of the business were fully heard, and much useful information was recorded to show how much the practice was improved in each trade under the system of inspection prescribed by the Metropolis Local Management Acts and the Nuisance Laws, which are executed by the corporative Vestries and District Boards. The trades specified in 1844 were blood boiler, bone boiler, fellmonger, slaughterer of cattle, sheep, or horses, soap boiler, tallow melter, and tripe boiler. Those who promoted the agitation were the Butchers' Trade Society, as they were most numerous, and, although that trade had never been required to conform to the law, they yet feared the penal construction which might be put upon it at the end of the period of 30 years. It did not appear to be understood that the "business of a slaughterer of cattle, sheep, or horses" did not refer to the butcher who killed his own beasts, but applied to those who killed for other persons for hire, or kept knackers' yards, and the letter used to be the most offensive places. By the new Act the trades are divided into two classes. The blood boiler, bone boiler, manure manufacturer, soap boiler, tallow melter, and knacker are prohibited from anew establishing such businesses within the metropolis, subject to a penalty of £50 for establishing, and also a like penalty per day for carrying on the same. The word "anew" has a wide meaning as given in the statute. The other businesses of a fellmonger, tripe boiler, or slaughterer of cattle, and any other businesses declared to be offensive, are not to be established anew without the sanction of the local authority. That authority is to inspect and make orders and by-laws for the regulation of these trades after hearing all objections. The local authority for the metropolis (except the City of London) is the Metropolitan Board of Works, and the Commissioners of Sewers within the City. The Vestries and District Boards are to inspect as to nuisances, and the Privy Council inspectors can inspect as to disease in animals. The magistrates are to enforce the law under the Summary Jurisdiction Act, subject to appeal to Quarter Sessions. Justices at Special Sessions are to grant licences for slaughterhouses, as a matter of course, where the sanction of the local authority is obtained. A "slaughterer of cattle" means a person whose business it is to kill any description of cattle, including sheep, goats, or swine, killed for use as butchers' meat. A "knacker" means a person whose business it is to slaughter any horse, ass, or mule, or any cattle, &c., not for use as butchers' meat. One notion is put in print—that business premises may be extended anew "half an acre," whereas it was "half their original extent in area;" but that is now altered to an enlargement without the sanction of the local authority. Great exaggeration has also been used in reference to public slaughterhouses and the defects of pri-

vate places, whereas the members of the committee who visited several of both kinds, found the latter greatly to be preferred to the former in regard to cleanliness. The butcher who slaughters can kill when it suits him and clean up, but the

public slaughterer has to meet the demands of numerous persons at any time, and may be always in an untidy state, as was found at the slaughterhouses of the Metropolitan Cattle Market by the members of the committee who visited it.

HIGHWAY LEGISLATION.

At the quarterly meeting of the Notts Chamber of Agriculture, the minutes of the last meeting having been read and confirmed, Lord GALWAY, M.P., the Chairman, said the attendance was probably not so large as it would otherwise have been owing to the Lincolnshire Agricultural Society holding their show at Grantham that day. The subject put down for discussion was Highway Legislation. He was bound to say that he did not exactly know what that meant, because there was nothing before Parliament at the present moment which bore on that question. The subject, however, was influenced by that of local taxation, which might be discussed another session, and it was no doubt highly desirable that this Chamber should discuss the matter. It was a great satisfaction to their representatives in Parliament to know their opinions on matters of this kind. It was a sort of guide to them, and although luckily they were not delegates and did not quite do what people told them to do, they liked to know the opinions of their constituents before voting on questions in Parliament. He had now to ask Mr. Gilbert to read his paper on the subject of Highway Legislation.

Mr. H. GILBERT, of Barnby-in-the-Willows, said it was perhaps presumptuous in him to have undertaken the task of introducing this question, but having been requested to do so by the Council of the Chamber, and believing it to be worthy of their attention, he would do his best to discharge the task he had undertaken. Mr. Gilbert then proceeded: Every public way which is a thoroughfare and common to all people is a highway, whether carriage ways, bridle, or foot ways. Some have become so by use, some by dedication, and some are awarded roads, and a few of these are repaired by private persons, but the greater part are now, and have been for a great length of time, repaired by the respective parishes in which they are situate. In 1285 an Act was passed enjoining the "lords of the soil" to enlarge those ways, where bushes, woods, and ditches were situated, in order to prevent robberies, clearly showing that the lands over which the public had a right of way belonged to the owners of the soil, which I believe is the case to this day, the public only having the right of way. An Act was passed in the reign of Philip and Mary enacting that two surveyors should be appointed annually, and the inhabitants of the parishes were obliged according to their respective ability to provide labourers, carriages, and tools, &c., to work on the roads four days in each year under the direction of the surveyor. In the reign of Charles II. power was given to raise an assessment and the power of levying a toll was first established. In the reign of William III. and following reigns turnpike Acts were passed, and commissioners appointed to carry them into execution, and in the reign of George II. turnpikes were distinguished from other highways. In the reign of George III. the turnpike Acts were consolidated. The highways were repaired at the expense of the parishes, and the turnpikes at the expense of the persons using them, tolls being collected, but if sufficient could not be collected then a portion of the cost was thrown upon the parishes. The Justices of the Peace had power to inflict a fine of £5 on any surveyor not doing his duty, or not keeping the roads in good repair, and in case of his neglect to put them in repair, then they had the power to fine him the full amount the road would cost, and also the expense of a person to superintend and put the road in good order. Notwithstanding these extraordinary powers which the magistrates still retain, our county magistrates have adopted the Permissive Act, and divided this county into highway districts—25 and 26 Victoria. The district we are now in—the Newark highway district—comprises 50 parishes, and 200 miles of road. There is one surveyor (and I must say the board are perfectly satisfied with him) to superintend it, and it is not competent for the board to appoint another, unless as a deputy under him. So he has to look over 200 miles, to see how the labour is performed, to set out the work

and see it is properly done, keep books, &c. Why, the thing is perfectly impossible. Some may say, "Oh, the waywardens may look after the men;" but if so what use is the surveyor at all. But the waywardens have no authority or power except as the board may order. After giving a humorous instance of the difficulty of men working under two masters, the waywarden and the surveyor, he proceeded: I find that this district cost last year about £18 per mile, and the turnpike roads £32—altogether £1,849. The Clerk, Mr. Newbald, has kindly allowed me to look over the expenses incurred by the fifty parishes before they were formed into a district, and I find that in the two years 1863 and 1864 the cost was £6,730. In the two years ending Dec., 1873, £7,677, being an increase of £97, or £173 per year. Add to this the cost of turnpikes last year, £1,156, and we find £1,630 per annum in excess of the old system chargeable to this district. I intended by request a few months ago a meeting of the Central Chamber in London, and a discussion took place respecting highway legislation. The feeling was most decidedly against the highway district system. One gentleman from Lincolnshire stated that a deputation from the parishes had requested the justices not to form these districts, but to fine the overseers £5—they not having done their duty. The consequence is that the roads are better looked after and only three surveyors have been fined. Only one district has been formed in that county—Gainsborough, and the chairman, Sir C. Anderson, has expressed his regret that that should have been made, and the gentlemen said they had declined to appoint a surveyor in their district, the waywardens performing that duty and so rendering the Act inoperative. Another gentleman placed in my hands a printed statement of the working of the Act in Worcestershire, which county is divided into seven districts. In one district the expenses are 6½ per cent. less than in the other six districts. The expenses are increased 4½ per cent. on the average. If the present Highway Boards thought the old system less expensive and preferable to the new, they should represent that to the magistrates who had still the power to deal with them. Should that be the case, and parish surveyors were appointed, they ought to be allowed a mileage to remunerate them for their trouble. He fully acceded with the abolition of toll-bars, believing that in many cases they were expensively managed. Having referred to the Worksop and Kelham turnpikes and Newark and Leadonham as examples, he concluded by moving the following resolutions: "That it is the opinion of this Chamber that the roads should be under parochial management subject to the control and financial supervision of the justices or of a local or district board. That compelling the various parishes (in the highway district) to repair and maintain the abandoned turnpike roads is an act of great injustice, thereby relieving the public at the expense of the country ratepayers, and that Parliament should be requested to pay out of the public purse annually three-fourths of the expenses of repairing and maintaining such roads to such parishes or highway districts."

In reply to the Chairman, Mr. GILBERT said he would not press his resolution to a division, but he should be glad to hear the opinions of members upon it.

Mr. C. NEVILLE (Thornley Hall) said the question of turnpikes and the maintenance of highways were matters that had not specially engaged his attention, but as a land owner and county magistrate he was compelled to have some general knowledge of these subjects. The difficulty seemed this, that assuming there was a grievance, what was the remedy? Now add to that he might say that some years ago a great statesman asked him his opinion on a matter of importance at that time. The statesman listened to him for a considerable time, and then asked what was his remedy? To that he (the speaker) replied that he was only a country squire, and that ministers were paid £5,000 a year to provide remedies. In the same way they should discuss matters of this kind, and their members of Parliament were the proper persons to provide

remedies. Reverting to the question of highways, he thought it very hard that a small parish should be taxed for the maintenance of a turnpike which the inhabitants never went on a single foot. He also thought the system was bad of having one surveyor in large districts. Take his own parish of Thorney. They paid a gentleman for driving about in a gig. Why he would engage to do that work for half the money. And as to his superintending the whole of the roads, it was an impossibility. He suggested as he did at a meeting at which the late speaker attended, that the Highway Board should occupy the same position as the bench of magistrates, and that if complaints were made of a road being bad, the parish should be ordered to repair them. There was no occasion to pay a surveyor to look after them, because if there was an intelligent man in any parish he could see the work was done.

The CHAIRMAN: You have some bad roads at Thorney, have you not?

Mr. NEVILLE: Very good, my lord. There is not a better parish going. He went on to say that every parish should be left to maintain its own roads. What with the poor-rate, highway-rate, and other burdens, local taxation was rapidly increasing, and whether it fell on landlord or tenant, they were both interested, and he thought no landlord ought to sit by and see his tenantry overburdened if he could help it.

Mr. CRIPWELL (Mansfield-Woodhouse) said he had had some experience in the questions raised by Mr. Gilbert. He was most familiar with the Mansfield district, the accounts of which he had now before him. He found that the Mansfield district compared favourably with the Newark, and that had led him to inquire the reasons why the Mansfield district did the work so much better. It seemed to him that there was something wrong in the system pursued in this locality, and that more money was spent than there was any good reason for. He made these remarks because Mr. Gilbert seemed to have based his observations on what was being done in the Newark district. With regard to the Mansfield district, they had 122 miles of road, whereas in Newark they had 201.

The CHAIRMAN: Newark is rather an awkwardly-fixed district.

Mr. CRIPWELL said the cost per mile for repairs only in the Mansfield district was £9 7s. 6d., whilst at Newark it was £17 14s. The common charges for turnpike repairs in the Mansfield district were £2 per mile, whilst in the Newark district they were £5 15s. Probably, however, they had a larger proportion of turnpikes in the Newark district. With regard to salaries the Mansfield district paid £1 5s. per mile, and the Newark district only £1. They paid a lower salary per mile because the mileage was less. Their clerk's salary was £30, and the surveyor's £120; in the Newark district the clerk's salary was £40, and the surveyor's £175. For manual labour they paid in the Mansfield district £5 16s. 3d. per mile; in the Newark district it was £7 16s.; for daily labour they paid in the Mansfield district £1 2s. per mile, whilst in Newark they paid £2 12s. 8d.; for materials (and they were rather favourably fixed) the cost per mile in the Mansfield district was £1 12s. 10d., whilst in Newark it was £6; tradesmen's bills were 7s. per mile in the Mansfield district, and 13s. 8d. in this district. As far as the Mansfield district was concerned it was admitted by all, that under the new system the roads had very much improved, and that they were getting the improvements made at a less expense.

Mr. PINDER: What kind of material do you use?

Mr. CRIPWELL said they used the materials best adapted to the various districts. They had one surveyor who looked over the whole district, but the waywarden was expected to supervise him in his own parish, and if he had any fault to find, it was his duty to attend the Board and make a complaint. The surveyor in their district had shown the greatest readiness to listen to any suggestion made to him. He had thought it his duty to lay this fact before the meeting, as showing how the system worked in his district.

Mr. GODBER asked whether there was any desire in the Mansfield district to return to the old system?

Mr. CRIPWELL said they would be very sorry to do it. Their roads had very much improved, whilst it had cost them no more.

The SECRETARY, Mr. Browne, stated that he had received a letter from Mr. Walker, of Mattered, in which he referred to the subject under discussion.

The CHAIRMAN proceeded to read the letter. Writing from

Scarborough Mr. Walker said: "I see your subject for discussion is 'Highway Legislation.' Under the old system of toll-bars the maintenance of the through roads was paid by those who used the roads and charged back on the consumer in the price of goods so carried. Now goods are carried by rail and the cross roads are cut up more than the through roads are. I have always held that all taxes gathered on horses, carriages, &c., should go towards the maintenance of through roads, the bye-roads being maintained by the farmers as theirs of right by usage. This is one thing to be brought forward in our Chambers, and is on the same principle as this, that all taxes should be paid by consumers either directly or indirectly, for all are consumers but all are not producers, and any tax which presses on the fully-manufactured article is a consumers' tax, but not unless. The incidence of taxation is the first thing to be considered, and is of much more consequence than some measures which, though good in principle, interfere with freedom of contract and drive the thin wedge into the rights of property. Conservatism should be to adopt what is right, root out what is wrong; let all the good we know of old be dovetailed with the new.

Mr. GODBER (Balderton) said in his opinion the whole subject seemed to resolve itself into two questions—efficiency and economy—how they could in the cheapest and most economical manner efficiently maintain the roads. He referred to the improvements which had taken place in the condition of the roads since the time when he was a boy, when it used to be said they were up to the axle-tree, and he observed that there had been a great improvement under the present system, not only with regard to the material used but in the securing a greater amount of uniformity. He wished to point out that here they were in a very bad condition as compared with the Mansfield district in point of material. It seemed that the question of material made up the whole of the difference between the two districts. The question was, could they mend themselves by going back to the old system? He was afraid not. He really thought that although the new system had cost a certain amount more money the increased cost would not continue. He maintained that their roads would not cost them so much henceforward as they had done in bringing them to the state they were in at the present time. The surveyors were not responsible for the size of the districts, and where a surveyor acted well with a waywarden they got on very well. In his own parish, where they had an efficient waywarden, they got on very well. He did not think so much cost would be required for years to come, and therefore he did not look upon this as money lost or thrown away. As to the turnpikes, it had been said that there was no agitation about them, that there was a great deal of dissatisfaction about it, and it was dissatisfaction that generally grew into agitation. The question arose, how would they remedy this real grievance? He believed the question would require a good deal of discussion before they could arrive at any satisfactory solution of it. During his last election Mr. Disraeli was asked by one of his constituents, "What about the turnpikes?" and his reply was that it was a mess. If they were a mess then, they were a mess now. It was for the agriculturists, however, to press their grievances, and to ask that some plan may be devised for relieving them of some of their heavy burdens. The education question, the sanitary regulations, and the turnpike question, had all come on during the last four years, and they had made a difference of 6d. in the pound. He pointed out that every man, woman, and child paid £1 per head to local charges throughout the country, quoting Mr. Goschen to the effect that the local taxation of the country amounts to 30 millions a year, and as agriculturists paid so much to imperial taxation, they ought to be relieved as much as possible of local taxation. He could not, however, bring his mind to vote for the old system of managing their highway, though he thought some more economical plan should be devised for dealing with the turnpike roads.

Mr. NEVILLE asked whether the expenses of the new system were diminishing?

Mr. GODBER said they were, and would do so in time to come.

Lord GALWAY said he was much gratified at the tone the discussion had taken. Mr. Gilbert's resolution he thought, from the first, was rather too general and sweeping in its character to command universal approval, and therefore he thought that gentleman had acted very wisely in saying he would be satisfied if a discussion took place without taking the feeling

of the meeting on the resolution. He thought they ought to return their thanks to Mr. Gilbert for bringing the subject forward. The more fully these questions were discussed the better able they were to form a judgment on them. Now, Mr. Gilbert's resolution almost seemed to express that the existence of these highway roads was very unsatisfactory to the country generally. There were two sides to the question however, and he knew there were many who considered that their roads were in a much better state than before. The question of expense was of course one of great consideration, and it only showed the difficulty of the subject when they heard Mr. Gilbert's figures, and the figures given by Mr. Cripwell in his excellent speech, and stating the difference between the Mansfield and Newark districts. With regard to the surveyors, it was said that it was impossible for them to go over the whole of a large district, but he would remind them that they had to keep accounts.

Mr. CRIPWELL: Only his own, my lord, not the general account; they are kept by a clerk.

Lord GALWAY: Still he would have to keep small accounts, and they required a fairly educated man to do this. One observation struck him as perfectly true, that surveyors could not be expected to see every portion of the roads kept in good order, but he must say that, as far as his judgment went, the waywardens did not exert themselves sufficiently. He would suggest that they ought to have the power to give directions to those who were repairing the road. If they saw a man acting wrongly in his work they ought to send for the surveyor to attend to it. (Mr. Cripwell: They do so with us.) It struck him (the noble lord) that a great deal more might be done by the waywardens if they would take a little more trouble. There was no one more alive to the advantages of local management than he was. In some of these Acts of

Parliament there was too great a tendency to centralise than to leave matters in the hands of gentlemen on the spot who are able to judge for themselves. With regard to local taxation, he reminded them that the Chancellor of the Exchequer had shown his good will to the country by putting £150,000 on one side for local expenses. That might be said to be a drop in a bucket, but still it was a step in the right direction. They were aware perhaps a new Valuation Bill had been introduced, bringing mines, plantations, and game into valuation. He told them fairly, however, that he did not see how game could be rated, except where it was let. He remarked that he had hitherto had his plantations rated as land in an uncultivated state, and if the Assessment Committee only used their common sense, and act fairly to the landowners and between themselves, there would be no difficulty about it, and it would be ten times better than going up to head-quarters to know how to do it. This proposal, however, would relieve the farmer of a small amount of rate, and he only mentioned it to show that it was a step in the right direction, and to express the hope that next session, if the present Government remained in power, of which he was glad to say there was very little doubt, something would be done to benefit the agricultural as well as the urban interests. The noble lord then remarked that he took great interest in the turnpike question, having been on a committee consisting of Lord Faurlyn, Lord G. Cavendish, Mr. Wvyl, &c., and said he thought they would be acting wisely in not committing themselves on this subject, inasmuch as some general Act would probably be introduced next session.

Mr. GILBERT, in reply, said he was perfectly satisfied with the discussion his paper had elicited, and now withdrew his resolution, and expressed his acknowledgments.

AGRICULTURAL GEOLOGY.

THE NORTHERN DIVISION.

At a meeting of the Institution of Surveyors, Mr. John Clutton in the chair, Mr. E. J. SMITH read the following paper:

In the discussion on Mr. Squarey's excellent paper on this subject [already given], I observed that the geological formations might be conveniently identified with the letters of the alphabet, and that whether we pass from hence to Cornwall, or to Wales, or to Cumberland, or to Scotland, we equally pass over a series of formations corresponding to the series of letters between V and A. The igneous rocks form part of the Scottish border, and the granitic rocks are the basis of the Cumberland mountains, and all the intermediate formations, except the old red sandstones, will be traversed between those rocks and the formations already described by Mr. Squarey. In the northern part of England, the formation which attains the greatest height and governs the climate and the directions of rivers and roads, and affected the course of traffic, is the great mountain limestone and Yoredale rock, corresponding to the letter E; the formation which is the most valuable is the coal formation identified by G; while the new red sandstone formation (marked K) is the most extensive; lying upon the rivers Tees, Trent, Severn, and Mersey, and touching the tidal waters of all the three seas which guard the English shores. This mountain limestone range forms the Penine change or backbone of England, the great watershed and high ground of the north with a length of 200 miles and an extreme elevation of 3,000 feet, whence the rivers fall rapidly westwards to the Irish Sea, and, by longer courses, eastwards to the German Ocean, whilst the ancient roads from south to north run along its eastern side, guided mainly by the facilities for passing each successive eastern river. Bounded to the westward by the igneous rocks which form the Cheviot hills, this mountain limestone range enters England on the Scottish border, and extending along the eastern coast for about thirty-five miles, strikes across the western sides of the counties of Northumberland and Durham to Crossfell, 3,000 feet above sea level, and thence enters Yorkshire above Barnard Castle. At Brough there is a remarkable depression of 1,000 feet, through which

run the British and Roman roads from east to west, after which the range again rises to 2,400 feet, and throws a northern arm westwards to Cocker-mouth on the Irish Sea. Brough is nearly the centre of the limestone range from north to south; from Brough to Clithero in Lancashire, it continues at its full width; and from Ingleborough, 2,360 feet high, a southern arm is thrown across Furness to the Irish Sea; the main body extending southwards to Ashbourne in Derbyshire, and reaching a height of 2,500 feet in that county. Detached portions of this range appear in the counties of Leicester, Gloucester, Somerset, Carmarthen, Brecon, and Monmouth, generally connected with coal fields; but these portions are comparatively insignificant in extent. This formation is of more value in a geological than in an agricultural point of view, and is chiefly in pasture; where there is sufficient soil and not too much height or exposure it is productive as arable, but this is upon only a small portion of the range. On the north side of Crossfell, at an elevation of 1,500 feet, land not worth one shilling per acre has been brought to ten times that value, by cutting surface drains to carry off the rain-water—some sixty inches of annual fall. At Alston, which is 900 feet above sea level, a very narrow strip of land on the South Tyne river may be worth £3 an acre, and this is surmounted by a zone of land worth 30s. to 20s. an acre, and then the hillside runs up to moorland very rapidly. Near here, at a level of 1,500 feet above the sea, the Gildersdale enclosure has remained uneffected for many years, because a recreation ground of 250 acres was considered indispensable. There is no house within two miles, and the nearest habitation is 800 feet below the common. Not far from Hlaydon Bridge, about 500 feet above sea level, Mr. Grey, the receiver for the Greenwich Hospital Estates, has also greatly improved a large extent of land. The sheltered lands along this part of the South Tyne, rising to a level of 700 feet, are now fair arable land, let at from 30s. to 20s. an acre. Lands let on lease at 30s. during the high prices of 1813, were in 1822 obliged to be reduced to 20s. on account of the fall in prices. The greater part of the lower land throughout Northumberland is on this formation, and has been brought into good cultivation, and is admirably farmed at rents

averaging fully 30s. an acre. On that coast line are several remarkable peaks of igneous rocks (Bamborough Castle and the ruins of Dunstauborough Castle stand upon two of them), and where these igneous rocks form soil they are very good turnip land, worth 35s. to 40s. an acre. They are, however, of small extent. From Barnard Castle to Clithero, and, indeed, wherever the elevation of the limestone range exceeds 700 feet above the sea, this formation is almost wholly in pasture; but there are variations in its character. Near Skipton and throughout the Craven district, it carries very good grass, worth 30s. an acre on the high grounds, and 70s. in the dales, and generally along its eastern side, where it is at all sheltered, it is fair pasture if well cared for. The western side is exposed and precipitous. The northern arm to Cocker-mouth (crossed at Shap by the Lancaster and Carlisle Railway) being chiefly at a high level, and subject to great exposure is, perhaps, the portion least capable of improvement. The southern arm crossing Furness, where not too much exposed to the westerly winds, presents on the contrary, some of its most favourable cultivation, for the range falls rapidly to Morecambe Bay, and this portion is good land, chiefly under arable cultivation, at rents of fully 30s. an acre. As a general rule altitude and exposure have more to do with the unproductiveness of this formation than its natural character; for wherever limestone soil on any formation has depth, the grass is sweet and healthy, and sheep farming can be profitably undertaken. There is very little residential value attaching to any part of this range, except where mineral springs have brought a population for medicinal purposes. On its western side, at sea level, the rainfall ranges from 32 to 65 inches yearly; while on the eastern side, at sea level, the rainfall ranges from 20 to 40 inches yearly. The western side, therefore, is more suitable for the growth of grass, and the eastern side for the growth of corn. The Government returns of agricultural produce have for some years been divided into two parts, the one headed grazing, and the other corn; but the grazing division includes Northumberland, Durham, and the North and West Ridings of Yorkshire, on account of the large proportion of mountainous land within them—the elevation and latitude occasioning a climate ill suited to the growth of corn. As regards minerals, this mountain limestone range comprises at the Derbyshire end four limestone strata, 1,800 feet thick, with three layers of basalt, 360 feet thick, with some lead ore and zinc. But as the range continues northwards, the limestone strata part from each other, and the basalt wears out, until in the vicinity of the junction of the three counties of Durham, Cumberland, and Northumberland, the limestone strata lie apart in sixteen beds, with 700 feet of sand and shale between the highest and the lowest, while the basalt is confined to one bed, 120 feet thick. At this northern end are lead ore, zinc, and some copper, and the lead ore has been so largely recovered that one-fourth of the whole annual supply of English lead has come from it. At this point also large detached ranges of iron ore, better in character than the Cleveland ore but not equal to the hæmatite iron ore, are found. At this point also seams of coal put in as the limestone thins out, and one of the best house coals is found in part of this range, although at other points the seams contain comparatively inferior coal. I may add that the limestone strata continue to diminish after entering Scotland, and the coal strata to increase, so that in Scotland the greater part of the house coal is derived from this formation. These coal seams have nothing whatever to do with the Newcastle or with any other of the English coal fields, being part of a previous geological formation. Near the western extremities of both the arms of this range is found that most valuable iron ore called hæmatite. There are no certain surface indications, but pots or bowls of hæmatite iron ore, without connections with each other, or anything to indicate whether any one will prove to have only a trace of iron ore, or will extend to fifty or to any larger number of acres, are found and worked. This ore on the surface may be worth 30s. a ton, and by this iron ore has been raised the newly-erected borough of Barrow-in-Furness. It contained 200 inhabitants in 1851, and in 1871 returned to the census a population of 18,585 persons. In this borough a single order to build 1,000 new houses has been given, and each house has been occupied as soon as finished. Having taken as our central basis the great mountain limestone range passing down the centre of the North of England, we shall find on the western coast that many earlier formations are altogether absent, and on the eastern coast that three steps take

us from the oolitic series marked N, to alluvial soil marked Z; an interval which, in the south-east of England, requires all the intervening letters of the alphabet. I will first remark upon the country westward of the range to the Irish Sea. There are three granite rocks in Cumberland (marked A), and at the central point where Cumberland, Westmoreland, and Lancashire meet, there is the green slate and porphyry rock (marked B), and this appears to be the centre of disturbance which brought upon the surface the Cumberland mountains and their accompanying lakes. Agriculturally, this area is of little value; but for residential purposes many sequestered nooks and sheltered lake-side spots are of a value dependent entirely on the enthusiastic temperament of the purchaser. Nothing is more thoroughly enjoyable than a well-selected residence in the lake district. On its northern side this green slate has the before-mentioned northern arm of the mountain limestone immediately upon it, and the coal measures (marked G) are immediately below the mountain limestone. The upper silurian, and the old red sandstone, and the millstone grit, above the coal, and the magnesian limestone below it (denoted by C, D, F, and I), are all certainly absent in this district. These coal measures were long used only for local consumption and for the supply of coal to Dublin. Some mines are 1,000 feet deep, and have, in part, been worked under the sea for many centuries, and at one point the workings extend nearly two miles from the shore. Occasionally the sea breaks in and drowns a colliery—the last instance was in 1837. The coals are now worked also further inland, as the facilities for railway carriage have rendered inland pits commercially practicable. The coal measures rest directly upon the conglomerate sandstone (marked H), and this upon the new red sandstone (marked K)—the rock which lies lowest between the sea and the Cumberland hills, and chiefly along the courses of the rivers. The Valley of the Eden contains as good land as any in the north, letting at from 70s. to 40s. an acre, and good feeding land is found along the rivers; but the greater part of the higher land of the district is arable, ranging from 10s. to 30s. an acre, surmounted by pasture land of little value, and by mountain moorland. There are many residential situations within this area, but they are not easily accessible from the great centres of wealth. Reverting to the before-mentioned central point, where Cumberland, Westmoreland, and Lancashire meet (marked B), and proceeding southwards instead of northwards, the green slate rock is followed by the upper silurian (marked C), which is entirely wanting on the northern side, and which is divided into four sections, and this rests upon the mountain limestone. The old red sandstone, and the millstone grit, and the coal measures, and the conglomerate sandstone, and the magnesian limestone (denoted by D, F, G, H, and I), are all absent, and the new red sandstone (marked K) rests directly upon the mountain limestone before referred to. This new red sandstone extends southwards over the western side of the whole county of Lancaster, and is low-lying (seldom more than 100 feet above sea level), fertile, sheltered from the east winds, and subject to much rain, and is specially fitted for market gardens. The district in Lancashire, called the "Filde," has for many generations been famed for its fertility; a great part is in pasture, and there are many portions possessing a high residential value, as well as the more immediate vicinities of the great towns and of the city of Manchester. This new red sandstone continues southwards from Lancashire through Cheshire to the tidal level on the Mersey. Cheshire is, as you are aware, the great dairy county. About four-fifths of the dairy farms are in grass, the other fifth providing the straw and the turnips, and a good dairy farm may average a rent of 38s. an acre. The land runs naturally to grass, so that a grass field, which if ploughed up in Yorkshire or Nottinghamshire would take twenty years to restore itself, would in Cheshire become, in four years' time, indistinguishable from old pasture. The new red sandstone continues to Staffordshire, and then sweeping round at the lowest level which would effectually create a watershed, unites with the Derbyshire, Nottinghamshire, and Yorkshire red sandstone plain, which reaches the tidal level on the Trent, the Ouse, and the Tees, while another portion runs down southwards from Staffordshire to the tidal level of the river Severn. This formation is sometimes a thick sandstone, and there the land is sought after for building purposes, and is very costly. The millstone grit (marked F) appears on this western side, chiefly between Clithero and Preston, on the edge of the mountain limestone, and the conglomerate sandstone and the mag-

nesian limestone (marked H and I) are, I believe, altogether absent. The coal field, which we shall presently find on the eastern side of the mountain limestone, seems to have been broken through by its upheaval, and is in full view on this Lancashire side. This Lancashire coal field still contains 5,000 millions of tons of coal, and if the coal in the whole of the seams existed under any one acre, and could be produced at the same moment on the surface, its value would exceed £4,000. Preston, Blackburn, Bolton, Bury, Rochdale, St. Helen's, Manchester, and the other western manufacturing towns owe their existence to this coal, and depend entirely upon its cheap production. I will now leave altogether the western side, and pass in review the formations to the eastward of the mountain limestone. The several formations, from the mountain limestone to the upper oolite, appear successively on the coast of the German Ocean, and extend in a south-westerly direction, as does also the chalk formation. The millstone grit (marked E) fails to proceed further southward than Derbyshire; the coal (marked G) extends with intervals as far as the Bristol Channel; the conglomerate sandstone (marked H) exists as far as the magnesian limestone extends, and both fail to appear further south than Nottinghamshire. The rest of the formations run through from the German Ocean to the Dorsetshire coast. Along the east side of the mountain limestone, from the German Ocean to Derbyshire, lies the millstone grit (marked F). Three miles, perhaps, in width from the coast at its northern extremity, it rises to an elevation of 1,500 feet, not far from Brough, about twenty miles south of the highest elevation of the mountain limestone at Crossfell, and forms the eastern side of the Yorkshire hills, by Hawes, Middleham, and Halifax; one portion crops out under the limestone near Chesterfield, and another east of Macclesfield, near Cheadle. In Lancashire it is found, as before stated, from Clitheroe to Preston, and it runs up again to Ingleton, where a little detached plot of coal is found above it. There is little agricultural produce upon it, and in many parts there is peat moss, which may become valuable when our coal is exhausted, but not till then, and a part of the range is valuable only for grouse. From want of staple and its poor character, the arable and pasture land of this formation is far less improvable, agriculturally, than those of the greater part of the mountain limestone, but lying at a lower level it is more sheltered. Nor are there any mineral treasures within it. The portion immediately to the south of the Tees is, however, full of residential mansions of great antiquity, lying between the Roman roads, which passed from Catterick to Walsend at the eastern and to Carlisle at the western end of the Roman wall. Next to this formation follow the coal measures (marked G), to which we owe our commercial prosperity for the last 100 years. The certain exhaustion of our coal in a very few years, in consequence of the enormous consumption to be occasioned by the use of steam-engines, was one of the griefs of the author of the Agricultural Survey of Lancashire, in 1793. But the use of these steam-engines enabled the recovery of thousands of acres of deep coal, and added fuel for 400 years. This formation contains little land of much agricultural value, its general characteristic being a cold, poor, wet, clay; when in pasture, full of carnation grass; and when in arable, expensive to cultivate. Lime is the only alternative calculated to render it productive, and is generally to be obtained at a moderate cost. Well limed, well drained, and well farmed, the soil is remunerative, and as soon as the tenant saves money he invests it in coal mines and gives up farming. The high price of labour, consequent on the contiguity of the coal mines, is met by the ready sale of the produce when the land lies among the collieries; but the cost of labour, at a slight distance from the collieries, has long been to northern agriculturists an item of more importance than it has been, even during the late scarcity of labour, in the southern counties. The leading coal fields, within my limits, are those of Cumberland and Lancashire before mentioned, of Durham, of Yorkshire and Derbyshire, of Staffordshire, and of Leicestershire, in addition to the first-mentioned Northumberland coal field on the mountain limestone. There are reasons for believing that all these (except the last) once formed one continuous coal field. The Durham coal field was certainly worked 700 years since for the London market. It comprises about 1,000 miles square, with two remarkable arms: one less than half a mile broad running due west, near the South Tyne, for thirty miles; and the other extending along the coast of Northumberland due

north from the main field for a distance of twenty miles, with an average width of eight miles. The main body of the Durham coal crops out on the western surface, against the millstone grit, reaching its most distant point from the sea in the neighbourhood of Raby Castle, and gradually falls to a level of 1,500 feet below the surface of the land under the sea coast at Sunderland. It contains about 5,500 millions of tons of unexhausted coal, and the present rate of yearly consumption is about 25 millions of tons. The coal measures have been washed out from beneath the southern part of Durham and the northern part of Yorkshire, so that there is a distance of sixty miles between the southern end of the Durham coal field and the northern end of the Yorkshire coal field, which also crops out on the millstone grit, and falls eastwards, and there is no coal-pit east of Rotherham. But there is no geological reason why the coal should not be found further eastwards. The Yorkshire and Derbyshire coal field is one continuous range, extending eighty miles in length, and containing 1,800 square miles. Its unexhausted contents would be moderately estimated at 25,000 millions of tons, and the present consumption is about 25 millions of tons yearly. The Derbyshire and Nottinghamshire portion has only been largely developed since railways afforded facilities for the sale of its coal, and of the produce of its iron furnaces. New pits are now in course of being won in these districts, equal to one-fourth of those in existence within them before the late coal famine. If the Shire Oak Colliery, 1,600 feet deep, lies in the centre of the Nottingham coal basin, and the seams rise (as is suggested) to the eastward, the whole of Nottinghamshire along the Trent, and of Lincolnshire nearly up to Lincoln, may contain workable coal. But this is very doubtful. The little but valuable North Staffordshire field lies thirty miles from the Lancashire and the Derbyshire coal fields, in a basin, with iron furnaces and the potteries upon it. This coal is chiefly used for manufacturing purposes, and no other article used in the manufactures for which the potteries are famous is found within the district. The china clay comes from Cornwall, and the pottery clay from the coast of Dorset. * Separated from the North Staffordshire coal field by a distance of thirty miles, the South Staffordshire coal field, recently enlarged by the Cannock Chase district, is next to the southward. The distinguishing feature of this district is the ten-yard or thirty-foot coal, on which its prosperity was founded. This seam, which is now for the greater part exhausted, divides, as it passes to the north-east, into several seams. The coal was very shallow over a great part of this South Staffordshire district, and was, therefore, won very cheaply. The shale lies upon the surface for miles together, rendering the land incapable of cultivation. Many acres are in possession of tithe-owners, because the tithe rent-charges on them are not paid; but the possession is worthless, and the tithe rent-charge is irrecoverable. The land cannot be made available for any purpose. The Leicestershire coal field is deserving of special mention. Charwood Forest is formed of the green slate and porphyries, which we met with in Cumberland (marked B). On each side of it is a small coal field, at Moira on the east and Coleorton on the west, identified like the other coal fields by the letter G, and the intervening portions of the series of formations between B and G are wanting, or are too insignificant to be recognised. The seams of coal are 50 feet thick at Moira and 40 feet at Coleorton. At Moira, at a depth of 600 feet, is a salt spring of a character very much resembling sea water, and it is raised and carried to the medicinal baths at Ashby-de-la-Zouche. The only other case of such a spring is in a coal seam under the bed of the sea on the Durham coast, and there, as here, the water, although as salt as sea water, is composed of different ingredients. The worst clay land I know is upon the Durham coal field. The consumption of produce by the towns of Newcastle, Shields, Sunderland, Durham, and Stockton, and by the masses of colliery population scattered about, keep the greater part of the district under arable cultivation, at rents of from 10s. to 30s. per acre. The same character pervades the other coal fields. Leeds, Wakefield, Sheffield, and the other manufacturing towns of Yorkshire keep up its rental value, and the masses of population congregated at the iron works of Derbyshire operate in like manner; but the shale and sandstone of the coal series are ungrateful to the agriculturist. Colliery sites pay at least double agricultural rents, frequently more; and when collieries require special accommodation, they have to pay accordingly. The conglomerate sandstone

(marked H) is almost altogether absent on this side of the Penine range, and very difficult to distinguish when present. The magnesian limestone range (denoted by I) follows the coal series on its eastern side, from the sea coast at Sanderland to nearly the southern side of the county of Durham, where the limestone has been washed out together with the coal formation. Along the Tees the new red sandstone lies directly upon the millstone grit, from whence it is evident that the coal series and the magnesian limestone are at that point both absent. Borings have been recently made 3 miles north of Darlington to the depth of 600 feet, which have confirmed the expectation that the millstone grit underlies the new red sandstone at that point, and consequently that there is no coal there. The magnesian limestone is found again about 20 miles southwards at Bedale, and extends thence to Nottingham. On the eastern side of the part in the county of Durham this formation is covered with clay and is generally poor; but about Staundrop, and along the Tees Valley, and during the rest of its course it is good farming land, and well repays spirited cultivation, being worth sometimes 40s. an acre as arable land; but the value of this range may be taken as varying from 20s. to 30s. an acre, according to the depth of soil. It is a favourite residential soil, especially the eastern side, which overlooks the new red sandstone plain to the eastward. East of the magnesian limestone we return to the new red sandstone (denoted by K), which we found to a small extent in Cumberland and largely in Lancashire, Cheshire, and Staffordshire. The portion adjacent to the magnesian limestone is residential in character, as well as those portions which attain a higher level in Nottinghamshire and other counties. This is attributable to the sandy nature of those parts of the formation, which otherwise is of a purely agricultural, although very various character. On the north side of the fertile valley of the Tees the calcareous particles having been washed into it, it is generally good; but beyond the reach of ancient floods, it is very heavy clay, expensive to cultivate. On the southern side the bank of the Tees is less than 150 feet above the level of the sea, and the land falls continuously to tidal level at York. It is a cold clay soil throughout this range, better fitted for pasture than for arable on account of the cost of cultivation, but producing a poor thin herbage. The rents vary from 18s. to 30s. an acre. In the vicinity of towns and villages, where continuous management for centuries has to a certain extent modified its character, and in some other special situations the produce is good. Liming is indispensable, and thorough drainage relieves it of superfluous moisture, but it is very subject to the uncertainties of the seasons. In Nottinghamshire, on the forest, this formation is a light sand, very agreeable for residence and, cultivated by sheep-farming, ranging from 20s. to 40s. an acre, and in the plain it is generally a cold strong clay, chiefly in arable, worth on an average 24s. an acre. In Warwickshire it is in some parts perfect land for residence and for farming; and in others cold clay, and the same in Worcestershire. The rent on land on this formation, well farmed, should seldom be less than 18s. an acre, while £3 an acre may be regarded as the highest rent except in very exceptional cases. The mineral products of this formation are gypsum and salt. The former has been for many years worked in Cumberland and in Nottinghamshire, and the latter in Cheshire both as rock salt and brine springs. Attempts are now being made to discover it at the south-east corner of the county of Durham; the existence of a good salt bed at that point having been proved, and the question being only one of cost. The lias (marked L) commences at the east coast, at the northernmost point of Yorkshire, and extends, almost uninterrupted, in a narrow band to the south coast at Lyme Regis, in Dorsetshire. It is, in the north, for the most part cold wet clay, with bands of limestone a few inches thick within it, and abounding in saurian remains, and is worth from 15s. to 25s. an acre to rent. The greater portion is in pasture, for which it is best adapted. Where the soil is immediately upon the stone, or where it is a loam rather than clay, it is productive, and such is its character in parts of Leicestershire and in the dairy districts of the West of England. The highest rent in proportion to the gross farming produce of land probably arises in the southern dairy districts on this soil. The lower oolite (marked M), the next in order to the south-east, is very various in its character between the coasts of Yorkshire and of Dorsetshire. It is in the centre and south, a brown dry soil through which the rain-water runs until it meets, and is thrown out by the lias clay below. It follows

that the greater part is under arable cultivation, and that it affords fair and moderately certain returns. The rents vary from 25s. to 35s., or even 40s. an acre. Throughout its course there are ironstone beds. The great value of the iron ore near Middlesborough is due in part to the proximity of the Durham coal, and of the water carriage of the Tees, and in part to the quantity of the ironstone to be readily obtained by open working on the face of the hills or by drifts of moderate depth and extent. At this northern termination of this range the hills rise to an elevation of 1,500 feet abruptly from the valley of the Tees, and form a table land of the wildest kind, over the space of 300,000 acres, in the triangle between Whitby, Pickering, and Middlesborough. In other parts, the elevation of this range is inconsiderable. Middlesborough contained in 1831 431, and in 1871 39,415 inhabitants, and is to the east coast what Barrow is to the west coast. The intersection of Northamptonshire by railways has brought into value the ironstone long known to be present at that portion of the course of this formation, and there is no geological reason why this ironstone should not be found at the southern end of the formation, and carried to the coal of South Wales and of the Forest of Dean. In Yorkshire, the coral rag, and Oxford clay (marked N), are found, in the northern part of the North-Riding, only at the base of the Cleveland Hills; but they re-appear on the south of the Humber—and the whole of the fen country south of the Humber—across the Wash to Huntingdon and Ely, is based upon the Oxford clay. The value of the fen land is maintained by the occasional digging up of the Oxford clay beneath it, and its incorporation with the present soil—a process costing on an average about £4 an acre. The rental of fen land depends chiefly upon the outgoings for drainage rates, otherwise, from 40s. to 45s. an acre would be the average rental. In Yorkshire, also, the Kimmeridge clay (marked O) is found only along the rivers Rye and Deiwent, above Malton. A very narrow bed crosses the Humber, and is a little more pronounced south-east of Horn-castle; but, practically, this formation is absent until it re-appears near Aylesbury. One of the distinguishing geological features of this Yorkshire and Lincolnshire coast is the total absence of the whole of these formations between the Kimmeridge clay and the chalk, which, in the South of England, lie south and east of the chalk, and constitute one of the leading fields for geological investigation and discussion. The Portland and the Purbeck limestones, the Weald clay, and the Hastings sands, even the lower green-sands and the gault, are all unknown beyond the Lincolnshire Wash, while the upper green-sand is a narrow band not always to be distinguished. The chalk (marked S) follows almost immediately on the Oxford clay (marked N), and constitutes one of the best cultivated and most profitable farming districts in England. From Filly to Burgh near Wainfleet, may be 160 miles, and the chalk range may average 10 miles wide, and it would be very difficult to find an ill-managed farm throughout the whole extent. Whether you think Yorkshire or Lincolnshire chalk farming the best, depends upon which side of the Humber you are born. You may take a hard day's ride on the one side or on the other without seeing any property which is otherwise than a credit to its owner and to its tenant. The rents range from 25s. to 40s. an acre. On leaving the chalk, the other distinguishing feature of the Yorkshire and Lincolnshire coast presents itself. The whole of the formations which in the South of England, interpose between the chalk and the alluvium (marked Z)—the London clay, the Bagshot beds, the rag, and the drift—are all absent, and the alluvium rests directly upon the chalk. Originally extending much further into the present sea, opposite Easington in Yorkshire, this alluvial soil has been deposited at the foot of the chalk hills between them and the sea, and is called, in Yorkshire, Holderness, and in Lincolnshire, the Marsh. Some of these lands may hold their own against Somersetshire and Devonshire pastures; all maintain the proverbial fertility of alluvial soil. The last accretion is that of Sunk Island, one of the most valuable of the agricultural estates of the Crown. It comprises 6,600 acres on the north side of the Humber, and has been almost wholly recovered within the last 200 years. About 1660 it contained 12 acres; about 1740 it comprised 1,550 acres; about 1810 it contained 4,500 acres, and in 1854 about 6,600 acres. It has been under the charge of Mr. Higgins from that time to his recent decease, and is held in fourteen farms, with some small tenancies, at rents amounting to more than £12,000 a year. It was open to general inspection at the Royal Agri-

cultural Society's Meeting at Hull this year; the buildings, cottages, road-fences, and general arrangements having been made by Mr. Higgins after 1854, in the most perfect manner compatible with a proper return upon the capital expended. I shall have pleasure at any time in enabling any Member or Associate of the Institution to view this property. In conclusion, speaking however imperfectly on geology, I should neglect a duty if I failed to remind you that, since we listened to Mr.

Squarey's paper, we have lost Professor Phillips, one of the most accomplished geologists, antiquarians and naturalists of the period. I would impress upon the younger Members of the Institution that, in the journeys which they necessarily take, any acquaintance with the geology, or the antiquities, or the flora of the districts, will add a charm to their professional labours, and, not unfrequently, be of great value to them in their professional career.

THE AGRICULTURAL STATISTICS OF IRELAND.

TO THE EDITOR OF THE MARK LANE EXPRESS.

SIR,—It is very natural that those who have hitherto governed in Ireland should take every opportunity of trying to prove that government a success. At every annual meeting of the Irish Royal Agricultural Improvement Society, accordingly, the country is treated by the Lord-Lieutenant for the time being to statistics, with this end in view. At the recent meeting of the Irish Royal Society at Wexford, this time-honoured custom was observed, and at the first blush the statistics then quoted by his Grace of Abercorn seem to be incontrovertible. A closer consideration of these, however, by those who know intimately the real circumstances of Ireland, shows them to be in a great measure fallacious. It is indeed most amusing to read the Wexford speech of the Duke of Abercorn by the light of a thorough knowledge of the actual condition of the Irish people. By the speech in question it appears there is not at present a single hitch in connection with the social state and the Government of Ireland. Wealth is accumulating, on the authority of the statistics quoted by his Grace; emigration is stayed owing to the good government which is abroad; the able-bodied are leaving the workhouses, and crime is everywhere decreasing. Why then the necessity for a large standing army in the country, for a large force of armed constabulary, for a Peace Preservation Act, and for the suspension of the Constitution over a great portion of Ireland? it may be asked. When everything is so peaceful, so happy, and so prosperous, surely the surplus army, the armed police, and the extensive application of coercive conditions of Government are superfluous, and calculated to oppress, to irritate, and to insult.

But setting aside the inconsistency of governing so peaceful and prosperous a country at the point of the bayonet and by acts of coercion, and, turning to a narrow examination of the statistics quoted by the Lord-Lieutenant at Wexford, what conclusion is to be arrived at by those most conversant with Ireland? Simply that by these a most erroneous and mischievous impression is sought to be conveyed. What are the facts? Emigration is stayed because there is a monetary crisis in America, and, as the upshot, a cessation of public works and demand for labour there. The workhouses of Ireland are being emptied a very little of their able-bodied inmates, partly because of the extra British demand for labour, and partly because of the depopulation of the country and of the scarcity of labour, in consequence, at home. It is grass and stock farming in every direction, and stock have sold high, partly owing to rinderpest in England a few years ago, partly owing to inflated trade across the Channel, and to the high prices for beef and mutton there, as the result of that inflated trade. Irish rents have in consequence been pushing up gradually from 60 to 70 per cent., and greatly-increased grist has thereby been going into the landlord's mill. Banks have extended

amazingly over Ireland within the last twenty years, and the old-fashioned system of hoarding money privately to a large extent thereby put an end to. Profitable grazing, increased rents, and less hoarding have contributed each its share to the purchases of Government stock and to the increased deposits in banks referred to by the Lord-Lieutenant. That is, the population of Ireland, to the extent of two and a-half millions or thereabout, has been shoved out since 1848, and the residue of the twenty-five millions worth or so which it annually took to support these has been successfully scrambled for by the landlords and the graziers and through these parties the funds, the banks, and the probate office have been in turn enriched. Adam Smith, in his *Wealth of Nations*, lays down the axiom that "labour is the only true source of national prosperity and wealth." The extraordinary thing, however, in connection with the Irish prosperity and increased wealth of which his Grace of Abercorn made so much at Wexford, is that labour has had little, comparatively speaking, to do with their production, for if Adam Smith is correct, the enrichment of the landlords and the graziers has been achieved at the expense of the social ruin of a nation, mainly owing to its misgovernment by an interested, shortsighted, and selfishly-calculating class.

Ill fares the land, to hastening ills a prey,
Where wealth accumulates and men decay.

A far surer indication of what is really the present social and internal condition of Ireland is to be found in the last years carrying statistics of the Irish Great Southern and Western Railway. A feather is said to show how the wind blows, and a falling off for the last year in the carrying trade of this extensive railway of £10,000, is of the weight of many feathers in demonstrating a falling off in the prosperity of the country—is of a weight, in fact, sufficient of itself to in a great measure invalidate the voluminous statistics of the Lord-Lieutenant at Wexford, and at the same time to verify the saying that figures can be made to prove anything and everything almost but the truth.

Contemporaneously with the speech of the Lord-Lieutenant at Wexford there is reported the speech of the Earl of Erne to his tenants in the county of Donegal. Lord Erne has been in Belgium and in Switzerland, the lands of yeoman and peasant proprietors—one a Catholic and the other principally a Protestant community. In neither country have the people been shoved out that rents might be increased and landlords enriched; and what does Lord Erne state of those thickly-populated lands and of those owners of the soil they till? They are models, he tells his Donegal tenants, of industry, of clean and good cultivation, and of happiness, contentment, and prosperity; valuable and important and unimpeachable testimony to an altogether different state of things from that of Ireland, is this testimony of Lord Erne. The people of these countries, and not a class, get the benefit of the wealth which, by their industry, they pro-

duce. How glad would his Grace of Abercorn have been if he had been able to show by statistics at Wexford, that the conditions of Belgium and Switzerland, as described by Lord Erne, were those of the "hewers of wood and carriers of water" of Ireland; but he could not. Under

imperial and landlord rule, the thing has been hitherto, is now, and ever will be, impossible.

Your obedient servant,

THOMAS ROBERTSON.

Narraghmore, Athy, Ireland, 25th August.

WELSH CATTLE AND CATTLE SHOWS.

At the Tivyside Show Mr. Gwyn, for the judges, said, I am agreeably surprised by what I have seen here to-day, by your show altogether, and particularly by those departments in which I shared with Mr. Pryse the honour of officiating as the judges. I was quite prepared, from my former acquaintance with it, to find a good show altogether; but I can and do assure you I did not expect to see so many good animals, first class animals, indeed, as I have done. In some cases they were very specially good, the merits were great and general. Mr. Pryse and myself, in many cases, had considerable trouble in coming to a conclusion. And I suppose that, even with all our trouble, there is no doubt we have made mistakes. I can mention one class—the yearling hacks—in which we had no easy work. There were 8 or 10 animals. We brought them down to five or six, and we were both quite puzzled as to which we should award the first prize. Now the colt that we both liked was a very poor one; and it may be some of you are dissatisfied. We believed her, however, to be the best-bred animal in her class, and that although not in good condition, she deserved the prize. The filly belongs to Mr. Blacker; and to him, as well as to some of the other exhibitors in that class, allow me to make one suggestion, that the feeding be a little more liberal. Depend upon it, Mr. Blacker, if you feed that filly better she will become a very fine mare. Then as to the pigs. We were asked to judge them (they were not originally in our department) when it was found that the other judges were not getting on so fast as had previously been expected. The pigs, I must tell you, were capital. They were not numerous, but I have never seen better. At Llanboidy, there were one or two pigs, perhaps, equal to some of those shown here to-day; but they were not, even at Llanboidy, better. The prize sow was a particularly fine animal. And now I come to a class with regard to which I would make the same suggestion that I made at Pembroke. I have been rather disappointed in not seeing a better class of good real brood mares. I would say this, gentlemen, that unless you breed from a good dam, in this class as in all others, it is true you cannot expect as good an animal. Breed from a good dam. With all humility, but still with all force, I would urge on you to get a better class of mares for your hackney classes. Of the mares which we had before us to-day, there were not over three or four good ones. We weeded them down to that, and it was with no great difficulty; so I think we may say there were not more really good mares. The mare we placed first struck us as being a remarkably good and useful animal; and if you had ten or a dozen like her in this neighbourhood, using the valuable sires you secure the services of, I believe you would have as fine a class of young hunters in this district as you could well wish for.

Mr. PROSSER said, I had the pleasure of being with you and occupying the same office some six or seven years ago, and can compare the present occasion favourably with that, so far as the class of the cattle and sheep shown is concerned. The coloured cattle shown here to-day beat anything in Carmarthen, I believe. The aged cattle are not to be easily excelled; I have not seen a better show in Carmarthen. Indeed from the excellent character of all the animals shown, I should have expected some trouble in coming to a decision in some of the classes; but I had Mr. Jenkins and Mr. Griffiths, two very excellent judges, with me, and we had not the trouble which might have been expected. In the matter of the prize for coloured cows perhaps some of you may blame us. We gave it to a small cow, but she was one of the finest and most perfect Ayrshires I have seen for a long time. I have not seen anything better in Carmarthen for some years. Some of the others were good cows, and well bred; but they were in poor condition. There was some very good stock in sheep, and I hope we shall see those who have been exhibitors here to-day at the Carmarthen Show.

Mr. GRIFFITHS said, I have been exceedingly pleased with

the show in every way. I was very glad to find that black stock was so well represented. I was pleased to find so good black stock in the county. For my own part, I would like to see our position better with regard to the breeding of black cattle. I am exceedingly pleased on the whole. I was sorry to find the prizes so low for the blacks, and grieved that when we had a good animal before us we could not give him a prize. It may be that by another year, increased support being given to the Society, there may be no like regret. There was one thing with which I was disappointed. I was not pleased to find the cattle being turned out of the yard so soon. And, again, there was a good deal of the time spent, after the judging should have been commenced, in arranging the cattle.

Mr. BAGNELL, with regard to the butter, was sorry there was not a greater quantity shown. It was good butter, but rather highly salted. That was a fault common in that district; they were all given to salt their butter too highly. He was sorry there had been no cheese on which he could have passed an opinion. The dairy produce on the whole was good.

HORSE BREEDING BY FARMERS.—At the show of West Gloucester Farmers' Club, Colonel Kingscote, M.P., said as regarded the department which he came there to help to judge—he meant the horses—he saw a great improvement. They all knew the price of horse flesh had very much increased. Population increased, and more people got money, and those people required horses and liked to get the best. It had often puzzled him in former years where on earth the horses could be bred, and what was more, how on earth they could be bred to any profit for the price given for them. He did not mean the best class of horses, but such as were used in the cavalry and artillery. The utmost price given for them at one time was £30. He asked practical men how they could breed a horse at a profit for £30? He had asked dealers how the farmers managed to do it, and they said the fact was they bred four or five, and if they got a little money out of one of them they thought they got money out of the lot, but they lost by all. However, the time had come when they could breed a horse to some profit. He knew more capital was required than to breed oxen and sheep, but, at the price horseflesh was now, if they used their judgment carefully he felt convinced that they could breed horses at a profit. At the Gloucestershire show he himself gave 150 guineas for a three-year-old that took the first prize, and although he did not know it at the time, it was bred five miles from his own place, from Badminton stock, and if anybody were to write him a check for £300 for the horse he thought he should look twice at it before he took it. With regard to the evidence he had given in the House of Lords, he thought the money given in Queen's plates might be usefully and properly given for the encouragement of people keeping horses in different districts of the country. He added that such a price was now given by the Government for cavalry and artillery horses as to make it worth a farmer's while to keep a mare or two.

REAPER TRIAL BY THE BANNSHIRE FARMERS' CLUB.—This trial was the allotment half-an-acre to each reaper. The judges were: Messrs. Hay, Trochelhill, Fochabers; Hunter, Dipple, Fochabers; Fortune, Cullen, Banff; Turnbull, Smithston, Huntly; and the following the awards: Self-delivery reapers—1, A. Gray, Floors (Woods); 2, Auchinachie and Simpson, Keith (Wood's new); 3, Jack and Sons, Maybole (improved European self-acting); 4, Ben. Reid and Co., Aberdeen (Samuelson's). Manual reapers—1, A. Sim, Elgin (Jack and Sons); 2, Ben. Reid and Co., Aberdeen (Picksley and Sims); 3, D. M. Osborne and Co., Liverpool (Kirby's combined mower and reaper). One-horse machines—1, J. Barclay, Huntly (Kemp, Murray, and Nicholson); 2, Auchinachie and Simpson, Keith (Wood's new).

THE WORCESTERSHIRE AGRICULTURAL SOCIETY.

MEETING AT DUDLEY.

Amongst the Shorthorns were the bulls Telemachus and Lord Irwin, the judges reversing the decision at Bedford by placing Telemachus first; he was also awarded the £25 for the best Shorthorn bull, and the Toddington Challenge Cup as the best specimen—male or female—of the breed. This champion prize had been previously carried off by both the bulls who disputed its possession on Tuesday; the owner of Telemachus having been the recipient of it at Malvern in 1871, and the owner of Lord Irwin at Stourbridge, in 1872, and at Evesham, in 1873. It must, however, be won three years in succession by the same exhibitor before it becomes his property. In the class of yearling bulls one of the sons of Telemachus came to the fore as an easy winner, and thus further proved his sire's worth as the best bull out. Next to him came Prince of the Blood Royal, a roan, the property of Mr. Akers; Mr. Hill's son of the Grand Duke of Kent being third; and Earl Beauchamp's Robin Adair the reserve. The cows in milk or in calf are a small collection, headed by Mr. Outhwaite's Vivandiere, who also obtained the £10 for the best cow or heifer upon the ground. In a small class of two-year-old heifers the first and second prizes were given to the Queen of the Georgians, sent by Mr. Akers, and Lord Beauchamp's Lady Adair; the third being withheld in consequence of there being less than six entries. The yearling heifers were so inferior that they were deemed unworthy of any of the prizes offered.

The Hereford bulls above two years old are only a trio, but two of them were the best of the aged bulls at Bedford. Their positions, however, are here reversed, Messrs. Fenn and Harding's Bachelor being accorded the precedence over Mr. Edwards's Winter-de-Cote, and the extra £20 for the best Hereford. The first of the yearling bulls is Mr. Taylor's Tredegar, and the second Mr. Edwards's Alfred. The cows are very good, and there was close competition between Mr. Taylor and Mr. Harding, who were respectively first and second. Only three appeared for the two-year-old heifer prizes. Mr. Edwards's Annie being the reserve for the extra £20 for the best of the Herefords. The first prize for pairs of dairy cows, in a class of four entries, was won by Earl Beauchamp. There is a moderate lot of Alderneys and Guernseys; three of the prizes going to Col. Barrows, and one to Mr. Henry Parkes.

The Shropshire sheep are not numerous. For pens of five breeding ewes Mrs. Beach is first, Mr. Baker second, and Mrs. Smith third. For theaves Mrs. Beach is first, Mr. Pulley second, and Mr. Firmstone third. Mr. Pulley takes all the prizes for shearing rams; those for older rams being divided between Mrs. Smith and Mr. Firmstone. The Southdowns are also but few, and the long-woolled classes consist mainly of Lincolns and Cotswolds.

The show of pigs is good, and some of the awards at Bedford reversed. The most successful exhibitors of the large white breeds, are Mr. Jacob Døve, Mr. John Wheeler, Mr. R. N. Clement, and Mr. R. E. Duckering; of the small breeds, Mr. Clement, who has the cup for the best white pig, Mr. Wheeler, and Mr. Duckering; of Berkshires, Mr. Heber Humfrey, who is first in all the classes, Mr. Spencer, and Mr. Matthew Walker.

Of horses, first came the agricultural stallions, of which there is a good entry; Mr. Statter's Young Champion, third at Bedford, being first; and Messrs. Yeoman's Pride

of England, second. The other cart and dray horses are moderate. The thorough-bred stallions are limited to four entries, but they include Citadel and Laughing Stock, who again occupy the same positions as they did at Bingley Hall, at Bedford, and other places. Their companions are Thunderer, bred by Colonel Barlow, by Thunderbolt, and Mr. T. E. Walker's Joek of Oran, a son of Blair Athol, bred by the late Mr. Blenkinsop. The class for thoroughbred stallions, "constitutionally sound," which have been used in Worcestershire during 1874, or certified to be used in the county during the next next season, brought only four entries, of which Mr. T. E. Walker's Statesman was selected for the Earl of Coventry's £20 prize. In the class of hunters above five years old, equal to 15 stone, Mr. Goodliff's Marshal M'Mahon was still the best; the second prize being conferred upon Mr. Hutton's Iron King; while in the class for hunters equal to twelve stone, Mr. Ashton's The Lancer was first, and Mr. Whitehead's Rufus second. Two prizes offered by Mr. Amos, the master of the Worcestershire Honours, for horses the property of tenant-farmers, resident in the county, were awarded, the first to Mr. Ockey, Stuckley Court, and the second to Mr. Cottrill, Temple Broughton, the only candidate. In a very meritorious lot of hunters under five years old, Mr. Goodliff's Lady Mary, second at Bingley Hall, last week, is first, and Mr. Hayward's Richelieu, highly commended on that occasion, second. Brood mares for breeding hunters are indifferent. The first prize for roadsters, not exceeding 15 hands 2 inches, was taken by Mr. Holmes, of Beverley; and the second by Mr. Wesley. For hacks not exceeding 15 hands, Mr. Woodall is first with a black mare; and Colonel Barrows second. The ponies are few.

PRIZE LIST.

JUDGES.—CATTLE: R. Doig, Lillingstone, Buckingham; F. Evans, Bredwardine, Hereford; C. Randell, Chadbury, Evesham. SHEEP AND PIGS: R. J. Newton, Campfield Farm, Woodstock; R. H. Masfen, Pendeford, Wolverhampton; J. Dale, Spetchley, Worcester. HORSES: J. M. Richardson, Compton Verney, Warwick; H. Lowe, Comberford, Tamworth; T. H. D. Bayly, Edwinstowe, Ollerton, Notts. IMPLEMENTS: B. Bonford, Pitchill, Evesham. VETERINARY INSPECTORS: Perrins and Carless, Worcester.

CATTLE.

SHORTHORNS.

Best bull in Shorthorn classes.—Prize, £25, Marquis of Exeter (Telemachus).

Bulls above two years old.—First prize, £10, Marquis of Exeter, Burgley Park, Stamford (Telemachus); second, £5, R. Bruce, Newton-of-Struthers, Forres, N. B. (Lord Irwin). Highly commended: J. W. Wilson, Broadway, Worcestershire (Earl of Warwickshire III.). Commended: J. Outhwaite, Bainesse, Catterick.

Bulls, above one and under two years old.—First prize, £10, Marquis of Exeter (Telemachus 6th); second, £5, B. St. John Ackers, Prinknash Park, Painswick (Prince of the Blood); third, £2, A. S. Hill, Oxley Manor, Wolverhampton.

Cow, in milk or in calf.—First prize, £8, J. Outhwaite; second, £4, Marquis of Exeter (Moll Gwyne).

Two-year-old heifer, in milk or in calf.—First prize, £8, B. St. John Ackers (Queen of the Georgians); second, £4, Earl Beauchamp, Madresfield Court, Great Malvern (Lady Adair).

Yearling heifers.—First prize, £6; second, £4; third, £2. No award.

The Toddington Challenge Cup, value 50 guineas, presented by the Right Hon. Lord Studeley.—Awarded to the Marquis of Exeter's Telemachus.

HEREFORDS.

Best animal in the Hereford classes.—Prize, £20, Mr. Fenn's aged bull.

Bulls above two years old.—First prize, £10, T. Fenn, Stonehook House, Ludlow, and J. Harding, The Green-house, Bridgnorth; second, £5, Mrs. Sarah Edwards, Wintercott, Leominster (Winter-de-cote).

Balls, above one and under two years old.—First prize, £10, W. Taylor, Showle Court, Ledbury (Tredegar); second, £5, H. N. Edwards, Broadward, Leominster (Alfred); third, £2 J. Harding.

Cow, in milk or in calf.—First prize, £8, W. Taylor (Dainty); second, £4, J. Harding. Highly commended: T. Rogers, Coxall, Bucknell, Salop (Sunset). Commended: Mrs. Sarah Edwards (Young Mermaid 2nd).

Two-year-old heifers, in milk or in calf.—First prize, £8, H. N. Edwards (Anne 2nd); second, £4, J. Harding; third, £2, J. Morris, Madeley, Herefordshire.

Yearling heifers.—First prize, £6, H. N. Edwards (Cary); second, £4, W. Taylor; third, £2, J. Harding.

SHORTHORN DAIRY COWS.

Pair of cows, in milk, any breed.—First prize, £8, Earl Beauchamp, Great Malvern; second, £4, T. Kingsby, Boars Croft, Tring, Herts (Seraptriana).

Alderney or Guernsey bull.—First prize, a silver cup, value £5, Col. Barrows, Hagley, Stourbridge (Alderney); second, £2 10s., H. P. Parkes, Castlebourne, Belbroughton, Stourbridge (Royalty).

Alderney or Guernsey cow, in milk or in calf.—First prize, £5, Col. Barrows (Goldthorne); second, £2 10s., Col. Barrows (Madcap).

Best cow or heifer in the cattle classes.—Prize, a silver cup, value £10, Mr. Outhwaite's cow.

SHEEP.

SHROPSHIRE.

Five breeding ewes, having had lambs in 1874, and suckled them up to June 1st.—First prize, £5, Mrs. S. Beach; second, £3, W. Baker, Moor Barns, Atherstone; third, Mrs. H. Smith, Sutton Maddock, Shifnal. Commended: W. F. Firmstone, Rockingham Hall, Hagley, Stourbridge.

Five theaves.—First prize, £5, Mrs. S. Beach; second, £3, J. Pulley, Lower Eaton, Hereford; third, £2, W. F. Firmstone.

Shearling ram.—First prize, £5, second, £3, and third £2, J. Pulley.

Ram of any age.—First prize, £5, Mrs. H. Smith; second, £3, W. F. Firmstone.

SOUTH AND HAMPSHIRE DOWNS.

Five breeding ewes, having had lambs in 1874, and suckled them up to June 1st.—First prize, £4, and second, £2, H. Sydney Waller, Farmingham, Northleach (Southdowns).

Shearling ram.—First prize, £4, H. Sydney Waller (Southdown).

Ram of any age.—First prize, £4, H. Sydney Waller (Southdown).

LONGWOOLS.

Five breeding ewes, having had lambs in 1874, and suckled them up to June 1st.—First prize, £5, and second, £3, T. W. D. Harris, Wootton, Northampton.

Five theaves.—First prize, £5, T. W. D. Harris. Shearling ram.—First prize, £5, and second, £3, R. Swanwick, Royal Agricultural College Farm, Cirencester (Cotswold).

Ram of any age.—First prize, £5, J. Wheeler, Long Compton, Shipton-on-Stour (Cotswold); second, £2, R. Swanwick (Cotswold). Highly commended: T. W. D. Harris.

The best animal in the sheep classes.—Prize, a silver cup R. Swanwick.

PIGS.

The best pig of white breed.—Prize, C. R. N. Beswicke-Royds, Pyke-house, Littleborough.

Boar pig of large breed.—First prize, £5, J. Dove, Hambrook (Lord Hambrook); second, £3, J. Dove (Sailor). Highly commended: J. Wheeler, Shipton-on-Stour. Commended: C. R. N. Beswicke-Royds.

Breeding sow of large breed.—First prize, £5, J. Wheeler, second, £3, R. E. Duckering, Northorpe, Kirton Lindsey. Highly commended: C. R. N. Beswicke-Royds.

Two hilt of large breed.—First prize, £5, C. R. N. Beswicke-Royds; second, £3, J. Dove (Perfection Hilt). Highly commended: J. Dove (Roses).

Boar big of small breed.—First prize, £5, C. R. N. Beswicke-Royds; second, £3, R. E. Duckering. Highly commended: G. M. Sexton, Wherstead-hall, Ipswich, Suffolk (Disturbance).

Breeding sow of small breed.—First prize, £5, J. Wheeler; second, £3, R. E. Duckering. The class commended.

Two hilt of small breed.—First prize, £5, C. R. N. Beswicke-Royds; second, £3, Ditto.

Boar pig of the Berkshire breed.—First prize, £5, H. Humfrey, Kingstone Farm; second, £3, J. Spencer, Villiers-hill, Kenilworth.

Breeding sow of the Berkshire breed.—First prize, £5, H. Humfrey; second, £3, M. Walker, Stockley-park, Anslow, Burton-on-Trent.

Two hilt of the Berkshire breed.—First prize, £5, H. Humfrey; second, £3, Ditto.

HORSES.

Stallion cart-horse for agricultural purposes.—First prize, £15, T. Statter, Stand Hall, Whitefield, Manchester (Young Champion); second, £10, Messrs. Yeomans, Pennymore Hay, Four Ashes, Wolverhampton (Pride of England).

Stallion cart colt, for agricultural purposes, not exceeding three years old.—Prize, £5, S. Davis, Wollas Hill, Pershore.

Cart gelding or mare, three years old or upwards, which has been regularly worked.—Prize, £5, T. E. Walker, Studley Castle, Warwickshire.

Cart mare and foal.—First prize, £5, G. Thompson, The Hill, Dudley; second, £3, T. E. Walker (Jewel). Commended: J. W. Webb, Cradley, Malvern (Frolic).

Cart filly or gelding, two and under three years old.—First prize, £5, S. Davis; second, £3, G. Thompson.

Dray horse, light-legged (gelding or mare), 16 hands, capable of trotting six miles an hour with a load of a ton weight.—First prize, £10, G. Groves, Crookberrow Farm, Whittington, Worcester; second, a silver cup value £5, J. Smith, Bank Farm, Pedmore, Stourbridge (Suip).

Thoroughbred stallion (open to all England).—First prize, £50, Lieut.-Col. Frederick Barlow, Hasketon, near Woodbridge, Suffolk (Citadel); second, £10, R. Hutton, Gloucester-place, Portman-square, London (Laughing Stock).

Thoroughbred stallion, constitutionally sound, that has served mares regularly in the county of Worcester during the season of 1874, or that is certified to serve mares in the county of Worcester in the season of 1875, and whose covering fee for half-bred mares has not exceeded the sum of five pounds.—Prize, £20, T. E. Walker (Statesman).

Hunter, above five years old, equal to 15 stone weight.—First prize, £25, J. Goodhiff, Huntingdon (Marshal M'Mahon); second, £10, R. Hutton. Commended: W. Whitehead, Wollaston, Wellingborough; C. C. Hayward, Southill, Biggleswade (Paramour).

Hunter, equal to 12 stone weight.—First prize, £20, T. H. Ashton, Temple Langherne, Worcester (The Lancer); second, £10, W. Whitehead.

Hunter, the property of tenant farmers resident in Worcestershire.—First prize, £10, W. Ockey, Suckley Court, near Worcester (The Lawyer); second, N. Cottrill, Temple Broughton, Droitwich (The Claimant).

Hunting mare or gelding, under five years old.—First prize, £10, J. Goodhiff (Lady Mary); second, £5, C. C. Hayward (Richelieu).

Roadster, not exceeding fifteen hands two inches, over two years old.—First prize, £10, G. Holmes, Bar House, Beverley; second, £5, C. H. Westley, Queen's Cross, Dudley.

Hack, not exceeding fifteen hands.—First prize, £5 5s., S. Woodall, Netherton, near Dudley; second, £3, W. Barrows, Hagley, Stourbridge (The Pony).

Pony, under fourteen hands.—First prize, £5, G. Thompson; second, £3, J. Grove, Catskill, Bromsgrove (Quicksilver).

Brood mare, for producing hunters.—First prize, £10, F. Blakeway, Stourbridge (Ledbury Lass); second, £5, The Earl of Coventry, Croome Court, Worcester.

IMPLEMENTS.

The prizes in this department were awarded as follows:

Best general collection of implements.—£5 and silver medal, J. L. Larkworthy and Co., Worcester.

Best collection of implements manufactured by exhibitor.—£5 and silver medal, Hill and Smith, Brierley Hill.

Silver medals to the following: H. Webb and Co., Chemical Manure Works, Worcester; Corbett and Peele; R. A. Lister and Co.; Lewis and Co.; E. Humphries; Wallis and Ste-

vens; Head, Wrightson, and Co.; G. Hathaway; E. Webb and Sons; J. Carter and Co.

At the dinner Lord DUDLEY, the chairman, firmly believed, and he thought he should be borne out by those who took upon themselves all the anxiety of keeping the society together, that, if the association had stopped in the capital of the county it would before this time have ceased to exist. It was a question however, how they could make the meeting even better than it was now. That they had found that its vitality consisted in moving it about instead of having one local habitation was something, but it seemed to him there was even more that might be done without adding very greatly to the work of those who were good enough through many years to watch over the success of the association. It must not be supposed that the visitors to the show came to look at the things that were presented to them without thinking that the arrangements involved much thought and trouble, and that honour was due to those who from one year to another were constantly studying how they could best secure the success of the society. But there was no doubt of one thing—and it was brought home to him more that day than ever before by casual remarks that were made—that the great object to be aimed at was this, that they should get such funds together as would make it worth while for the owners of the best animals to exhibit them, and at the same time would enable prizes to be given to local competitors who would not have the fear of having to pit their animals against those that were already marked with public approbation. It was not to be supposed that the two magnificent animals who were the prize-winners in the first class of beasts were brought as a mere matter of speculation; their pre-eminence had already been attested, although number one might become two, and two become one, according to different judgments. A great deal of love was doubtless embodied in such beasts, and it was natural there should be, if the prices now realised were any criterion of what a man felt towards the animal he bought. He remembered, at a sale of Lord Ducie's some years ago, £600 was thought to be an immense sum, but a friend of his had gone to America and brought a cow back to England at a cost of £6,000. If it were true that their love was where their treasure lay, then the man who gave £6,000 for a cow must have a certain love for it. After the birth of a calf from so valuable a mother, he must anxiously watch the development of it as to whether it was perfectly straight in its limbs and back, and whether it was capable of being made fat—because some had such natures that they could not fatten—and then he had to submit it to judges, some of whom might declare it to be number 1, while others might pronounce it number 2. Therefore, in such a society as theirs, they must see that they offered prizes worth competing for by the owners of such valuable animals, but at the same time gave something worth striving for by those living in the county who were likely to compete among themselves. He had regretted the fact that the farmers of the county did not take any very great interest in a show which was peculiarly their own. The reason, perhaps, was this, if a man had an animal which the judges would not think worthy of remark, and which, consequently, would be open to criticism, he was prevented from sending it, and the society lost the exhibition of it. Therefore he (Lord Dudley) urged that, if it were possible, they should so arrange the prizes as that they should attract competition from other counties, while they bore in mind that the society was among themselves and for themselves, and offered inducements to men living in the county to become careful breeders. It was surely not too much to offer a £10 prize to a breeder—not that the £10 was in itself any great consideration, but it made the exhibitor a marked man among his fellows as one who chose to invest more than they of time, trouble and money. In coming there that morning he had heard that there was a falling off in the numbers exhibited at that show, but when he came upon the ground and asked some questions—which they might suppose he did with interest, because he might be pardoned for wishing that if the society were successful anywhere it might be at Dudley—he was glad to find that, although what he had heard was to a certain extent true, the exhibition altogether was a good one. He would venture to assert that if the funds were forthcoming—and he firmly believed they would be, for the society had wanted support not among its friends but from exhibitors—and the prizes were so arranged that a man could feel that the

best of what he could produce would have a fair chance of being a successful specimen, the society would be prosperous and long-lived. It was no longer a purely agricultural exhibition. There was introduced much that tickled the popular fancy, and the jumping contests especially had large numbers of admirers, but although that part of the show was good enough in its way, and although that part of the show was good enough in its way, and although horses, as a matter of course, formed a valuable part of any such exhibition, he trusted it would never be forgotten that the foremost object of such an association should be to improve the breeding of cattle, and next the breeding of that smaller, but equally profitable, class of animals, sheep.

Mr. W. E. DOWDESWELL, M.P., said when the society first left the cattle market at Worcester and went to Henwick it was really saved from ruin. There was still a large number of persons in the county who regretted that the society had an open show, and would like to have it confined to owners and occupiers resident within the county. More than one of the judges had recommended them to adopt a new policy. They pointed out that the animals which were exhibited here had previously been shown at the meetings of the Royal, the West of England, and other societies, and they suggested that those animals should be prohibited from being shown at the local meetings in the same year in which they were exhibited at the national and large district meetings. He could not think that the prohibition for one year would make any real difference in the shows. Very few animals were exhibited a second time at the Royal or Bath and West of England shows; after appearing there they went on a local tour—he believed with great advantage to the places where they were exhibited—and if the prohibition were adopted, it would only be postponing the present results for a year. He would wish, however, to say to the members of the society that, if they thought the present principle was not correct, and would communicate with the stewards or committee, the best attention would be given to their suggestions. He could not sit down without expressing another sentiment which had been in his mind ever since the migratory system was started, namely, that a plan which brought the agriculturists of the county every other year, and sometimes two years running, into an urban district—manufacturing, mining, or otherwise—must do a great deal to rub off those rough corners which once existed in the relations between town and country populations.

Lord HAMPTON offered his hearty congratulations to his brethren, members of the society, and to all who wished well to it, on the proof which that meeting afforded of the signal success of the migratory system. It was an excellent system, and gave a stimulus such as nothing else ever had done to their operations by calling into action not only the good feeling of those who were active members of the society and active agriculturists, but also the interest and good feeling of the several localities in which the meetings were held. He should like also to offer them one word of congratulation on those blessings for which they had all to be thankful in connection with the present year's harvest. As regarded the wheat crop, seldom, if ever, had Worcestershire seen a better. Barley was good, and beans were not bad, and they had been blessed with the finest possible weather for getting in this great harvest. There was one crop that had not been good, and he almost thought had never been worse, that was the crop of grass. He could not help hoping that this season might teach a lesson to those who might be disposed somewhat too hastily to be alarmed by difficulties respecting labour, or difficulties of any other kind, to say the time was come when they must get rid of all their arable land and become grass farmers. He was afraid the grass farmers in the present year had not found the pursuit so profitable as it sometimes was. He congratulated the agriculturists of the county on the show that was before them. He was glad to hear what fell from his noble friend in the chair, and from Mr. Dowdeswell. He thought they were right in inviting the owners of the best stock in the kingdom to come there and exhibit it; and although Worcestershire farmers might not be sanguine—he did not know any personal friend of his who was sanguine—of selling a cow for £6,000, still they might depend upon it that the exhibition of such animals as were in that show yard did act as a stimulus to making them anxious to get the best stock they could. There was one remark that he had not unfrequently made on such occasions, and after what he had seen that morning he could not help making it again. Whether

the idea was or was not welcome, he must say, as a matter of humanity, that he shrunk from looking at the unfortunate pigs that were brought together on those occasions. He hoped he should live to see the day when it would be one of the rules of those societies that no pig should be exhibited that was not able both to see and to stand.

The CHAIRMAN did not think it would be wise, in regard to those magnificent animals which were the pick of the whole country, to put them on one side for a year before being brought to the local meetings. In that year they might lose much of their character from diseases which occasionally visited our herds, and which no care on the part of the breeder could avert. He advocated the bringing such animals into competition with one another in a class of their own, and giving handsome prizes for them. They should not be brought into

competition with animals whose owners did not pretend to be able to rival them, for if this were done an act of injustice was, perhaps unwittingly, committed. What they had at heart was to improve the prosperity of those among whom they lived, and the desire of many was that there should be a competition confined to the county. Local agriculture might be promoted in two ways—one was to encourage the agriculturists of the county in the breeding of stock, and the other was to put before them the best proofs of what could be done when capital and skill were combined. No president of an association, whether political or agricultural, or anything else, could do much good unless he was present in person and showed more than an indifferent feeling with regard to it. It was, therefore, with the greatest pleasure that he found himself able to occupy the chair that day.

AIREDALE AGRICULTURAL SOCIETY.

MEETING AT BINGLEY.

The cattle, though not very numerous, were good, particularly the aged Shorthorn bulls and cows. In the first-class—bulls over twelve months—the first place was taken by Mr. Fox's Leeman; and the second was awarded to Lady Pigot's Rapid Rhone; Mr. Rocket's Speedwell being highly commended, and Oxford Cherboey, third in his class at Bedford, passed over. In the competition for Shorthorn cows and heifers over twelve months, the entries included three from Mr. T. Statter; two from Mr. T. H. Hutchinson, Catterick; two from Lady Pigot; and one from Mr. J. H. Rocket. The class was a very good one, and the prizes were awarded to Mr. Hutchinson's Dairy Girl and Lady Pigot's Victoria Victrix. A silver cup of the value of £12, for the best two Shorthorns of any age or sex, was gained by Lady Pigot, Mr. Hutchinson's pair standing second. Horses generally form an important feature at the Bingley show, and roadsters and agricultural horses were good classes. A silver cup of the value of £20, given for the best hunter, equal to not less than 15 stone, was awarded to Marmalade, with Mr. William Armstrong's Cashier second, and Mr. Brady Nicholson's bay horse Wallet third. In the second class for hunters, without condition as to weight, a silver cup of the value of £20 was also given; and here Mr. T. H. Hutchinson's Jester was first, Mr. John E. Ingham's chesnut Monarch second, and Mr. E. Charlesworth's bay Bank Note third. Sheep were generally good classes.

PRIZE LIST.

JUDGES.—CATTLE AND SHEEP: R. Jefferson, Preston Haws, Whitehaven; G. Smart, Woodhouse Grange, near Abberford, South Milford. **HORSES:** J. Wilders, Croxton Kyriel, Grantham; E. Hird, Copeland-street, Manchester; and T. Smith, Holme, York. **PIGS:** J. Gledhill, Heckmondwike.

CATTLE

(Open.)

Shorthorn bull, over twelve months.—First prize, G. Fox, Wilmslow; second, Lady Pigot, Newmarket.

Shorthorn bull calf, under twelve months.—First prize, T. Statter, Manchester; second, J. Coates, Cleckheaton.

Shorthorn cow or heifer, over twelve months.—First prize, T. H. Hutchinson, Catterick; second, Lady Pigot.

Shorthorn heifer calf, under twelve months.—First prize, Lady Pigot; second, G. Fox.

Alderney or Guernsey cow or heifer.—First prize, E. Posselt, Shipley; second, H. Beldon, Bingley.

Two Shorthorns, any sex or age.—First prize, cup, Lady Pigot; second, T. H. Hutchinson.

(Open only to the district.)

Bull, over twelve months.—First prize, H. Monlding, Bingley; second, J. Horner, Bingley.

Bull, under twelve months.—First and second prize, J. Horner.

Cow for dairy purposes.—First prize, T. Wilkinson, Bingley; second, J. Robertshaw, Allerton Grange, near Bradford.

Heifer under two years.—First prize, M. Moulding, Gilstead, Bingley; second, J. Horner.

Heifer calf, under twelve months.—First prize, J. Horner; second, W. Whittingham, Cottingley.

HORSES

(Open.)

Draught colt, gelding, or filly, one year.—First prize, J. H. Crowther, Knowl Grove, Mirfield; second, E. Haley, Deen Lane Head, Allerton.

Draught gelding or filly, two years.—First prize, M. Lassey, Mount Tabor, near Halifax; second, R. Hird, Shipley.

Roadster colt, gelding, or filly, one year.—First prize, J. W. Mills, Chevin Grange, Menston; second, L. Margerison, Bradford.

Roadster gelding or filly, two years.—First prize, J. F. Crowther; second, J. Clarke, Beeston, near Leeds.

Roadster gelding or filly, three years.—First prize, J. Robinson, Hull; second, R. Farnhill, Batley.

Draught mare or gelding.—First prize, T. Statter; second, M. Lassey.

Mare or gelding for agricultural or general purposes.—First prize, J. R. Armitage, Bradford; second, J. Robinson, Lais-terdyke.

Mare or gelding for agricultural or general purposes, open to the district.—First and second prize, E. Townend.

Pony, in saddle, not exceeding 14 hands.—First prize, T. Mitchell, Bradford; second, G. F. Fletcher, Sheffield.

Draught stallion.—First prize, J. Edmondson, Burnley; second, R. Marshall, Keyingham, near Hull.

Coaching stallion.—First prize, T. Long, Menston, near Guiseley; second, J. Morphet, Studfo, near Settle.

Roadster stallion.—First prize, W. Vary, Stamford Bridge, York; second, T. West, Wilberfoss, York.

Cob, not exceeding 15 hands.—First prize, W. Stephenson, Cottingham, near Hull; second, W. Sadler, Hyde-terrace, Leeds; third, W. H. Cranswick, Thorholme, near Burton Agues.

Nag or roadster.—First prize, J. Robinson; second, W. Sadler, Vicar-lane, Leeds; third, S. Watkinson, Highgate House, Gargrave.

Pony, in single harness, not exceeding 14 hands.—First prize, G. F. Fletcher; second, W. Thorpe, jun., Bingley.

Horse or mare, in single harness.—First prize, T. Statter; second, T. Marshall, Kirkgate, Bradford.

Ladies' hackney, mare or gelding.—First prize, J. Wellburn, Seackleton Grange, Hovingham; second, J. Terry, Bradford; third, W. McLauchlan, Ilkley.

Hunters (weight carriers), equal to not less than 15 stone.—First prize and cup, J. M. T. Musgrave, Beverley; second, W. Armstrong; third, B. Nicholson.

Hunters, without condition as to weight.—First prize and cup, T. H. Hutchinson; second, J. E. Ingham, Bradford; third, E. Charlesworth, Bradford.

Leaper.—First prize, J. Wellburn; second, W. T. Tilford, Micklefield; third, J. Scatherd, Whirkirk.

SHEEP.

LEICESTER OR OTHER LONG-WOOLLED
(Open to the district only).

Ram, one-shear or aged.—First prize, E. Holden, Bingley; second, F. H. Butterfield, Bingley.

Ram lamb.—First prize, E. Lund; second, T. Wilkinson, Bingley.

Ewe, one-shear, or aged.—First prize, E. Lund, Cullingworth; second, J. Smith.

Ewe lamb.—First prize, W. Anderton, Bingley; second, J. Wilkinson, Bingley.

LONKS

(Open to the district only).

Ram, one-shear or aged.—First and second prize, J. Smith.

Ram lamb.—First and second prize, J. Smith.

Ewe, one-shear or aged.—First and second prize, J. Smith.

Ewe lamb.—First and second prize, J. Smith.

Half-bred ewe, one-shear or aged.—First prize, W. Anderton; second, W. Greenwood.

Half-bred ewe lamb.—First and second prize, E. Lund.

PIGS

(Open to the district only).

Boar, any age.—First prize, W. Dracup, Saltaire; second, G. Hargreaves, Shipley.

Sow, middle breed.—First prize, N. Holmes, Bingley; second, W. Firth.

Sow, small breed.—First prize, G. Hargreaves; second, W. Firth.

Store, under nine months old.—First prize, W. Dracup; second, J. Leach, Bingley.

Fat or store pig, confined to the parish of Bingley, and to persons in receipt of weekly wages.—First prize and cup, W. Preston, Bingley; second, M. Thompson, Harden.

LYTHAM AND KIRKHAM AGRICULTURAL SOCIETY.

MEETING AT LYTHAM.

The show, as a whole, was superior to any previously held by this Society, the total number of entries being 507, or 102 more than those of last year. The cattle were extremely good, particularly the bulls; and the horses, especially those for agricultural purposes, showed much improvement, but better mares are wanted. Sheep and pigs were but few.

PRIZE LIST.

JUDGES.—LIGHT HORSES: Mr. Atkinson, Barrowby Hall, Leeds, and Mr. Gray, Brampton. HEAVY HORSES: Mr. Brierley, Middleton, and Mr. Hutcheson, Catterick. CATTLE, SHEEP, AND PIGS: Mr. Dodds, Wakefield, and Mr. Ashburner, Ulverston.

CATTLE.

Bull, above three years.—Prize, R. Thomson, Mythop Lodge.

Bull, above two and under three years.—First prize, T. H. Clifton, Lytham; second, N. Cartmell, Westby.

Bull, above one and under two years.—First prize, T. Rigby, Carleton Lodge; second, J. Salthouse, Westby.

Bull-calf, under twelve months.—First prize, W. Porter, St. Michaels; second, R. Thomson.

Premium of £10 for the best bull, one year and upwards, the property of a tenant-farmer, and to serve in the district to the 24th June, 1875, subject to the rules of the Society.—Prize, T. Rigby.

Cow, in calf or milk, having had a calf, and above three years.—First prize, T. H. Miller, Singleton Park; second, R. Saul, Woodplumpton.

Heifer, above two and not exceeding three years.—First prize, T. H. Miller; second, R. Saul.

Heifer, above one and not exceeding two years.—First prize, Jas. Sykes, Breck House; second, R. C. Richards, Clifton Lodge.

Heifer-calf, not above one year.—First prize, T. H. Miller; second, J. T. Clifton.

Cow, in calf or milk.—Prize, R. C. Richards.

Three heifers, two years old.—Prize, R. C. Richards.

Three heifers, one year old.—Prize, R. C. Richards.

Three heifer-calves, one year old.—Prize, R. C. Richards.

Silver challenge cups, to be competed for by animals entered for the foregoing premiums, and for which first prizes have been awarded only:

Shorthorned male animal, of any age, the property of the exhibitor.—W. Porter.

Shorthorned female animal, of any age, the property of the exhibitor.—T. H. Miller.

Cottagers' cows.—First prize, J. Butler, Lytham; second, J. Riley, Wesham.

SHEEP.

Longwoolled ram, other than shearing.—First prize, Hon. J. B. Ogilvy, Westby; second, T. L. Birley, Kirkham.

Shearing longwoolled ram.—First prize, T. L. Birley; second, T. L. Birley.

Longwoolled ram lamb.—First prize, Hon. J. B. Ogilvy; second, Hon. J. B. Ogilvy.

Shortwoolled ram, other than shearing.—First prize, T. H. Miller; second, T. L. Birley.

Shearing shortwoolled ram.—First prize, W. Dodgson, Plumpton Hall; second, T. L. Birley.

Shortwoolled ram lamb.—First prize, W. Dodgson; second, T. H. Miller.

Three longwoolled ewes, any breed, to have been grazed in the district not less than three months, and to be kept for breeding.—First prize, J. T. Clifton; second, Hon. J. B. Ogilvy.

Three shortwoolled ditto.—First prize, T. L. Birley; second, T. L. Birley.

Three longwoolled gimmer lambs.—First prize, Hon. J. B. Ogilvy; second, T. L. Birley.

Three shortwoolled gimmer lambs.—First prize, T. H. Miller; second, W. Dodgson.

PIGS.

Boar of large breed.—Prize, H. Kirkham, Wrea Green.

Boar of small breed.—Prize, T. Crook, Inskip.

Sow of large breed.—Prize, J. Hall, Freckleton.

Sow of small breed.—Prize, J. Hall.

Cottagers' pig.—Prize, R. Fisher, Wrea Green.

HORSES.

Pair for agricultural purposes.—Prize, J. Parkinson, Lytham.

Brood mare for agricultural purposes.—Prize, J. Parkinson.

Three-year-old gelding or filly for agricultural purposes.—First prize, T. Cartmell, Clifton; second, W. Fisher, Lytham.

Two-year-old gelding or filly for agricultural purposes.—First prize, W. Shaw, jun., Thornton; second, R. C. Richards, Clifton Lodge.

Yearling gelding or filly for agricultural purposes.—First prize, G. Rea, Solwick; second, J. Marquis, Wesham Hall.

Colt or filly foal for agricultural purposes.—First prize, C. Fare, Clifton; second, T. Rigby, Carleton Lodge.

Brood mare in foal, or having had one in 1874, for hunting purposes.—First prize, T. H. Miller, Singleton Park; second, T. H. Miller.

Brood mare in foal, or having had one in 1874, for harness.—First prize, T. Fox, Singleton; second, W. Taylor, Hardhorn.

Gelding or mare, three or four years old, for hunting.—First prize, T. H. Miller; second, W. S. Hodgson, Kirkham.

Gelding or mare, three or four years old, for harness.—First prize, W. Cartmell, Morton; second, J. Nickson, Ballham.

Gelding or mare, three or four years old, for hackney purposes, exceeding 14 hands and not above 15 hands.—First prize, P. Catterall, Lytham; second, R. Hall, Thistleton.

Top.—First prize, T. Brigg, Keighley; second, J. Pickup, Newchurch.

Top hog.—First prize, G. Dewhurst, Rawtenstall; second, T. Brigg.

Top lamb.—First prize, T. Brigg; second, J. Pickup.

Three ewes.—First and second prizes, T. Brigg.

Three shearing ewes.—First and second prizes, T. Brigg.

Three ewe lambs.—First prize, G. Dewhurst; second, T. Brigg.

Three fat wethers.—First and second prizes, T. Statter.

GRAVEN AGRICULTURAL SOCIETY.

MEETING AT SKIPTON.

Cattle have been more largely represented, but, as regards the quality of the stock, this show has never been surpassed. The herd of Lady Pigot had its representatives in nearly all the classes, and succeeded in carrying off the principal honours including the cup for the three best Shorthorns, the property of one exhibitor. In the class of best cow in calf or milk of any age, the judges reversed the decision given at the Bingley show by awarding the first position to Lady Pigot's Victoria Victrix, over Mr. T. H. Hutchinson's Dairy Girl. Mr. Hutchinson was more successful in the two-year-old heifer class, where he carried the prize with Lady Playful. In the classes of Shorthorned cattle, open to tenant-farmers only, Mr. B. Fletcher won the first place with a really handsome roan two-year-old bull. The silver cup for the best three Shorthorns in the tenant-farm classes was awarded to Mrs. Atkinson. Horses were an unusually large show. There was a good turn-out of stallions, thoroughbred, roadster and draught, but all the awards went to exhibitors from a distance. The leaping of the hunters formed as usual a great source of attraction; but this could not be said to have been very successful. Sheep were a good show in the majority of classes, but more particularly of half-breds. The leading honours were carried off by Mr. William Varley and Mr. John Markendale—the former for pens of black-faced Scotch ewes, and the latter for half-bred Cheviots, and Mr. Henry Nutter, of Aireville Grange, Skipton, was a very successful exhibitor of half-bred lonk ewes. In the class of mountain sheep (Scotch breed), several pens of fine wethers were shown, and the class fully merited the commendations bestowed on it by the judges. Pigs were largely represented, especially in the classes open to general competition.

PRIZE LIST.

JUDGES.—CATTLE: H. Ambler, Watkinson Hall, Halifax; R. Jefferson, Preston Hows, Whitehaven. HORSES: Capt. Childers Thompson, The Mount, York; T. Gibbons, Burnfoot-on-Esk, Longtown, Carlisle; W. J. Robson, Ramshaw,

Whitley, York. SHEEP: C. Fawcett, Swimnythwaite, Bedale; J. Nelson, Cockerham Hall, Lancaster; T. Dodds, Wakefield. PIGS: J. Culshaw, Towneley, Burnley; S. Barrett, Harewood. ROOTS, BUTTER, CHEESE, OATCAKE, IMPLEMENTS: J. Culshaw, Towneley; S. Barrett, Harewood.

Six carrots.—First prize, W. Higson, Carleton ; second, J. Riley.

Stone of round potatoes.—First prize, W. Thoruton, Carleton ; second, T. Eatough, Clitheroe.

Stone of kidney potatoes.—First prize, T. Eatough ; second, C. Maud, Carleton.

Stone of fluke potatoes.—First prize, W. Lockwood, Skipton ; second, E. Fort.

WHITBY AGRICULTURAL SOCIETY.

The Whitby Society is one of the oldest in the county, having been established so far back as 1834. In the horse classes there was a very good entry, and the show of cattle was another meritorious feature, both numerically and as regards quality ; while the sheep and pigs were rather above the average.

PRIZE LIST.

JUDGES.—HORSES—Hunters, Roadsters, and Ponies : W. Annett, Ulgham, Morpeth, and A. Dunhill, Heselertou Grange, York.—Coaching and Agricultural : J. Kirby, Burton Fields, Stamford Bridge, and R. Hodgson, Langton Grange, Northallerton. CATTLE, SHEEP, and PIGS : J. Cattley, Stearsby, Easingwold, and G. Hamilton, Northallerton. MOOR SHEEP : G. Prodhams, Harwood Dale, and I. Garbutt, Farnedale.

HORSES.

Thoroughbred stallion.—Prize, P. Hogarth, Lythe. Coaching stallion.—Prize, C. Walker, Stakesby Mill. Agricultural stallion.—Prize, R. Marshall, Keyingham, Hull. Coaching brood mare, with her foal or stinted.—First prize, J. Reader, Holme, York ; second, F. Staiuthorpe, Newton Mulgrave.

Coaching foal, colt or filly.—First prize, W. Ward, Aislaby ; second, P. Campion, Overdale, Lythe.

Yearling coaching colt or gelding.—First prize, M. Wellburn, Fylingdales ; second, T. Jackson, Barmby East.

Yearling coaching filly.—Prize, P. Campion.

Two years old coaching gelding.—First prize, M. Wellburn ; second, J. Jackson, Goldsbro', Whitby.

Two years old coaching filly.—First prize, J. and J. Welford, Newton Mulgrave ; second, W. Daniel, Greenhamerton, near York.

Three years old coaching gelding.—First prize, I. Scarth, West Rounton ; second, W. S. Gray, Whitby.

Three years old coaching filly.—First prize, J. Barton, Thirsk ; second, T. Dobson, Saltburn-by-the-Sea.

Cleveland bay brood mare, with her foal or stinted.—Special prize, a cup, F. Stainthorpe ; second, J. and J. Welford.

Agricultural brood mare, with her foal or stinted.—First prize, W. Burnett, Whitby ; second, R. Dennison, Whitby.

Agricultural yearling, colt or filly.—First prize, T. Scooby, Kirbymoorside ; second, J. Cross, Whitby.

Two years old agricultural filly or gelding.—First prize, R. P. Petch, Skelton ; second, T. Newton, Easington.

Three years old agricultural filly or gelding.—First prize, R. Lee, Ferry Hill ; second, W. S. Gray.

Pair of agricultural horses.—First prize, W. Burnett ; second, R. Middleton.

Hunting brood mare, with her foal or stinted.—First prize, J. F. Leighton, Scarbro' ; second, W. Muzeen, Slingsby.

Hunting foal, colt or filly.—First prize, W. Muzeen, South Holme ; second, H. Ward, Whitby.

Hunting yearling, colt or filly.—First prize, W. Muzeen ; second, J. Weighill, Whitby.

Two years old hunting gelding.—First prize, J. Sedman, Pickering ; second, J. Cross.

Two years old hunting filly.—First prize, S. B. Robson, Ganton ; second, J. Dowson, Danby Castle.

Three years old hunting gelding.—First prize, S. B. Robson ; second, J. and J. Blackburn, Stokesley.

Three years old hunting filly.—First prize, A. Brigham, Malton ; second, E. W. Chapman, Whitby.

Hunting mare or gelding.—First prize, T. Darrell, Scarbro' ; second, W. S. W. Topham, Malton ; third, F. J. Walker, York.

Special prize for leaping.—First, J. H. Peart, Malton ; second, J. Cross.

Hunting mare or gelding.—First prize, H. A. H. Rastall, Ruswarp ; second, P. Campion.

Gentlemen's hackney or roadster mare or gelding, over 14½ hands.—First prize, W. H. Cranswick, Burton Agnes ; second, J. Robson, Malton ; third, J. Snarry, Malton.

Lady's hackney mare or gelding.—First prize, J. Wellburn, Shackleton Grange ; second, C. B. Musgrave, Whitby ; third, Mrs. F. J. Walker, York.

Pony mare or gelding, over 12½ hands, and not over 14½ hands.—First prize, M. Wellburn ; second, J. C. Hutchinson, Middlesbro' ; third, D. Allison, Stainsacre.

Pony mare or gelding, not exceeding 12½ hands.—First prize, J. Wright, Guisbro' ; second, G. Cummings, jun., Coul-dyke ; third, J. Robson, Malton.

Donkeys in the district.—First prize, W. Blytheman, Aislaby ; second, R. Jackson, Lythe ; third, T. Richardson, Sandsend.

Special prize for the best foal by Ivory Black.—First and second, W. Ward, Aislaby.

CATTLE.

Bull calf, under 12 months old.—First prize, H. Clay, Northallerton ; second, J. Wood, Spaunton, Pickering.

Yearling bull.—First prize, C. and J. Smith, Westerdale, Yarm ; second, W. Harrison, Underpick.

Two years old bull.—First prize, J. G. S. Hebron, Westerdale ; second, Jane Attlay, Whitby.

Heifer calf, under 12 months old.—First prize, J. Hebron, Castleton ; second, C. and J. Smith.

Yearling heifer.—First prize, T. Strickland, Thirsk Junction ; second, H. Clay.

Two years old heifer, in milk or calf.—First prize, T. Strickland ; second, C. and J. Smith.

Cow in milk or calf.—First prize, W. Ravis, Castleton ; second, C. and J. Smith.

DISTRICT PRIZES.

Bull calf.—First prize, G. D. Yeoman, Whitby ; second, E. Corner, Sleights.

Yearling bull.—First prize, W. Harrison ; second, G. D. Yeoman.

Four store calves.—First prize, G. D. Yeoman; second, H. Ward, Whitby.

Four yearlings.—First prize, J. Weighill; second, E. Corner, Whitby.

Two years old heifer, in milk or calf.—First prize, C. and J. Smith; second, E. Corner.

SPECIAL PRIZE.

Flea of cattle, as follows: Cow in milk or calf, not under four years of age; cow or heifer in milk or calf, two or three years old; heifer or steer, one year old; calf, heifer, or steer, under one year.—First prize, a silver cup, value £7 7s., C. and J. Smith; second, £3, J. Kerr, Lythe Hall; third, £1, E. Corner.

Dairy cow.—First prize, E. Lamb, Yew Cote; second, J. Ward, Ruswarp; third, C. Walker, Whitby.

Cottager's cow of any breed, with special reference to milking, the owner not being occupier of more than three acres of land.—Prize, J. Richardson, Sandsend.

SHEEP.

LEICESTERS.

Two-shear or aged ram.—First prize, Messrs. Doveners, Bedale; second, R. Tarbottom, York.

Shearling ram.—First prize, Messrs. Doveners; second, R. Harrison.

Tup lamb.—First prize, W. S. Gray, Whitby; second, Messrs. Doveners; third, W. Ward, Aislaby.

Pen of five ewes, having reared lambs in 1874.—First prize, Messrs. Doveners; second, Jane Atlay.

Pen of five shearling gimmers.—First prize, R. Tarbottom; second, Messrs. Doveners.

Pen of five gimmer lambs.—First prize, R. Tarbottom; second, W. S. Gray.

DISTRICT PRIZE.

Three Leicester tup lambs, bred by exhibitor.—First and second prizes, W. S. Gray.

MOOR SHEEP.

Two-shear or aged tup.—Prize, J. Waind, Kirbymoorside.

Shearling tup.—First and second prizes, J. Waind.

Tup lamb.—First and second prizes, J. Waind.

Pen of five ewes, having reared lambs in 1874.—First prize, C. and J. Smith; second, J. Waind.

Pen of five shearling gimmers.—First prize, J. Waind; second, C. and J. Smith.

Pen of five wethers, two-shear or upwards, bred by the exhibitor.—First and second prizes, J. Waind.

PIGS.

Boar of any breed, under twelve months old.—First prize, W. Lister, Armley; second, J. Cole, Whitby.

Sow of any breed, under twelve months old.—First prize, W. Lister; second, T. Strickland, Thirsk.

Boar of any large breed, over twelve months old.—First prize, W. Lister; second, D. Shaw, Moorsholm.

Sow or gilt of any large breed, over twelve months old.—First prize, S. Graham, York-road, Leeds; second, J. Woodcock, Egton.

Boar of any small breed, over twelve months old.—First prize, S. Graham; second, G. Chapman, Seamer.

Sow or gilt of any small breed, over twelve months old.—First prize, W. Lister; second, G. Chapman.

Cottager's pig.—First prize, J. Cole; second, T. Dickenson, Whitby.

At the luncheon Captain TURTON, the Chairman, said that free trade was as fixed as the sun, and that the prices of 1818 would never again be experienced in this country. In his opinion, butter in this country would soon become a luxury. Wool was very remunerative, and horses were fetching fabulous prices, which proved that grass paid better than arable land, and that butter was more profitable than wheat. He believed that they had far too many fields under the plough. He was glad that the ploughmen in this district had not been dictated to by demagogues, and were content with the fair day's wage for the fair day's work which the farmers were giving them. This had obviated ill-will between the farmers and their servants, and was a matter for congratulation.

WORSLEY AND SWINTON AGRICULTURAL SOCIETY.

In the open competition for Shorthorns the prize for the best old bull was given to Mr. R. Bruce, Newton of Struthers, Forres, N.B., for Lord Irwin; Mr. George Fox, of Hare Field, Wilmslow, being second with Leeman. Mr. Fox also entered for heifer-calves, and was beaten by the Earl of Ellesmere, the only other exhibitor in the class. His lordship showed in several other open classes, and was placed second for one-year-old bulls, Mr. R. Thompson, Mythop, being first, and second in that for one-year-old heifers. Mr. Statter, of Whitefield, won several prizes; the first in the classes for bull-calves, two-year-old heifers, one-year-old, and first and second for three-year-old cows and Ayrshire cows. In the class for bull-calves Mr. Boddington won the second prize, and in that for cows of the Channel Islands breed Mr. H. Dunlop was first, and Mr. H. Neild second. Some special prizes were given to Mr. John Gardner for extra stock; and in the horse and sheep classes Mr. Gardner was awarded several special prizes for stock sent for show, but not entered for competition. Mr. Neild was a successful exhibitor in the cattle classes, open only to farmers residing within the district. There was a large show of horses, particularly in the open classes, and Mr. Statter won several prizes; the first for the draught stallions, and second as well in this class; the second for thoroughbred stallions, Mr. S. Norbury, Cheadle, being first; and the second in the class for mares or geldings shown in harness. The prize for the best hunter, able to carry 14 stone, went to Mr. H. Charlton, Mr. R. M. Knowles being second; that for the best hunter, up to 12 stone, to Mr. Thos. Newton, Altrincham, Mr. Charlton being second; that for the best mare or gelding, 15 hands high, in actual use as a roadster, to Mr. J. Robinson, Hull;

Mr. E. M. Williams, London-road Mills, Manchester, being second; that for the best roadster under 15 hands, to Mr. T. D. Pritchard, Eccles; Mr. E. Armitage, Pendleton, being second; that for the best mare or gelding in actual use as a roadster, and under 14 hands, to Mr. R. Wright, Salford, Mr. C. L. Clare, Higher Broughton, being second; that for the best foals of 1874 got by the entire horse belonging to Mr. A. Lund, Darcy Lever, to Mr. W. Smith, Prestwich; that for the best pony, mare or gelding, under 13 hands, to Mr. W. S. Armitage, Hereford, Mr. L. Pilkington, Gateacre, being second; that for the best pony, mare or gelding, under 12 hands, to Mr. H. Marshall, Chorlton-cum-Hardy, Mr. J. Statham, Salford, being second; that for the best draught horse or mare to the Earl of Ellesmere, Mr. C. W. Brierley, Middleton, being second; that for the best mare or gelding over 14 hands, and shown in harness, to Mr. J. C. Rogerson, Oldham-street, Manchester; and that for the best under 14 hands to Mr. R. Wright, Salford, Mr. H. Marshall being second. First prizes for sheep were taken by Mr. H. Neild, Mr. Thomas Harrison (Barton-upon-Irwell), the Earl of Ellesmere, and Mrs. Ellen Edge. In the pig classes the Earl of Ellesmere took the great majority of the prizes; but in the two classes in which his lordship did not enter first prizes were given to Mr. G. Holland (Worsley) and Mr. D. Ashcroft (Preston), and a special prize to Mr. H. Neild. Judges—Cattle, sheep, and pigs: Mr. J. Woodhouse, Scale Hall, Lancaster; Mr. T. Dodds, Mount Pleasant, Wakefield. Light horses: Mr. W. S. Atkinson, Barrowley Hall, Woodlesford, Leeds; Mr. J. Bromley, Lancaster. Heavy horses: Mr. W. Carter, Grosvenor-street, Manchester; Mr. D. Ashcroft, Haigh-ton-house, Preston.

EAST CHESHIRE AGRICULTURAL SOCIETY.

MEETING AT MACCLESFIELD.

The horses, on the whole, were an indifferent collection, and were considerably less in number than last year; but there were some roadsters and horses for agricultural purposes. Mr. C. W. Brierley, of Middleton, was placed first in the open classes for pairs of draught horses, mares, or geldings, and mare or gelding for draught purposes. The Stoneleigh Colliery Co., of Lawton, were first in the class for three-year-old mares or geldings for draught purposes, but the competition was limited in many of the classes. In the class for two-year-old colt or filly for draught purposes Mr. W. J. Legh, M.P., Lyme Park, won the first prize; and in the class for stallions for draught purposes the prize for the best animal was taken by Messrs. Jos. and Jas. Wyld Poynton; Mr. T. Statter, Stand Hall, Whitefield, near Manchester, being second. Prizes were given for the best hunter, mare, or gelding, carrying not less than 13 stone, to Mr. P. P. Brocklehurst, Macclesfield; light-weight hunter and hack roadster, mare, or gelding, about 15 hands, Mr. W. C. Brocklehurst, M.P., Butley Hall; cob, not to exceed 15 hands, Mr. E. M. Williams, London Road Mills, Manchester; pony not to exceed 13 hands, the Rev. B. Lowther, Shrigley Park. There were also district classes.

As with horses, the show of cattle was not so good as last year. The silver cup for the best bull in the yard was taken by Mr. G. Fox, for Leeman. Mr. W. J. Legh, M.P., was first in the open class for bulls under two years old, and second in the classes for pair of heifers under three years, ditto under two years, and pair of heifer-

calves, Mr. George Fox being first in the three last-named classes. The Stoneleigh Colliery Co. took the prize for the best bull calf, and Viscount Petersham that for the best Alderney or Guernsey cow. Of the sheep, the long-woolled classes were the best, the rams of all ages being of more than the average merit; but, on the whole, the show of sheep was an inferior one. Mr. J. Nixon, jun., Ilarrop, carried off all the first prizes for long-wools, with two exceptions, the prizes for the best pen of long-woolled ewes, and ditto one year old. In these classes, however, Mr. Nixon did not exhibit. In the classes for short wools, Mr. J. Hague, Gawsforth, won the prize for the best pen of five ewes; Mr. W. J. Legh, M.P., those for rams of any age, and tup lambs; the Rev. J. Thornycroft, Siddington, that for the best pen of five ewes, one year old; Mr. A. Gardiner, Rainow, that for the best pen of five ewe lambs; and Mr. William Thompstone, Siddington, that for the best pen of five ewe-lambs. The classes for pigs were open only to members residing in the district, and the silver cup for the best boar in the yard was awarded to Mr. D. Briscoe, of Stockport. The judges were—of cattle, Mr. Hornby, Minshull Vernon, Crewe; Mr. Balmer, Tattenhall; Mr. Gilbert Murray, Elvaston, Derby. Horses (heavy): Mr. Ballharry, St. Helens; Mr. Whitelegge, Ashton-on-Mersey. Horses (light): Mr. James Boote, Weston Hall, Crewe; Mr. Samuel Holmes, Grosvenor-street, Chorlton-on-Medlock. Sheep and pigs: Mr. M. Walker, Stockley Park, Burton-on-Trent; Mr. William Smith, Top-o'-th'-Lea, Shuttleworth.

THE HALIFAX AND CALDER VALE AGRICULTURAL SOCIETY.

There were 99 entries of cattle, and Mr. Stephen Watkinson, Gargrave, and Mr. Thomas Wetherill, Durham, made the awards. Lord Irwin, brought his owner, Mr. R. Bruce, the cup for the best aged Shorthorn bull; Mr. Thomas Statter, Stand second. In the one-year-old Shorthorns Lady Pigot took the first and second prizes with Rapid Rhone and May King. Mr. Statter, with Hero, carried off the prize for the best bull-calf, and took one first prize and one second in Shorthorn cows with his Robin's Rose and Lady Graceful. Lady Pigot took the cup and several honours in the Shorthorn cow classes, showing the best three-year-old, Victoria Victrix; the best calf and the second best two-year-old. Mr. Hutchinson won the first prize for two-year-olds with Lady Playful, and the second for one-year-olds with Lady Alicia. Mr. Riley showed the best and second-best Ayrshire cow, the best and second-best dairy cow of any age, and the best and second-best in a class of miscellaneous breeds and cross breeds with a Highland Scot and a half-bred Angus and Shorthorn. Mr. Hall, Cleckheaton, showed the best Alderney, and Mr. Lewis, Halifax, the second, and was first in Guernsey cows, and Mr. E. Akroyd second. Mr. J. Wright, Warley, took a cup with three dairy cows; Mr. Nicholls, Luddendenfoot, second. Four of the cups were for competition by farmers in the parish of Halifax and adjoining townships only. The horse show was a large one, and the judges, Mr. J. J. Clark, Welton-le-Wold, South Lincolnshire, and Mr. W. F. Barwick, Newton, York, made the awards for hunters and roadsters; and Mr. George Robson, Easingwold, and

Mr. J. P. Edwards, Lytham, for coaching and draught horses. Mr. J. H. Wright won Mr. G. Davis' silver cup with Schuloff, the best thorough-bred stallion. For hunters the cup was won by Mr. W. Armstrong's Cashier; a second prize fell to Mr. Topham, and a high commendation to Mr. F. H. Hutchinson's Jester. Mr. W. Vary, York, showed the best roadster stallion, and won the President's cup. The best roadster mare or gelding was Mr. W. H. Blackman's, who took the silver cup. Other cups were awarded as follow: Mr. G. E. Emmett, Halifax, for the best mare or gelding for saddle or harness; Mr. J. F. Crowther, Mirfield, for the best roadster mare and foal, and also for the best draught stallion; Mr. C. W. Brierley, Middleton, for the best four-year-old draught mare; Crossley and Sons for the best tradesman's or farmer's draught animal, not exceeding 16½ hands, and the best pair of draught horses; Mrs. Joseph Crossley, Halifax, for the best carriage horse and best harness gelding; Mr. John Wellburn for the best lady's pad; Mr. W. H. Blackman for the best cob; and Mr. G. F. Fletcher, Sheffield, for the best pony in harness. Mr. Statter, Stand, took money prizes offered for the best yearling draught colt or filly, for the second-best draught mare or gelding, and for second-best harness mare or gelding. Mr. Jonathan Statham, Sunnyside Works, Salford, showed the best-mounted pony not exceeding 12 hands. The wool entries are naturally of great local interest at this show. The principal exhibitors and prizetakers were Holdsworth and Cockin, Halifax; Mr. J. A. Holmes, Bradford; Daniel Parker and Co., Halifax; W. Appleyard and Son,

Halifax; Mr. Young Haworth, Halifax; J. Eastwood and Co., Halifax. The judges were John Dewhirst, Elland, and Mr. D. Crossley, Ovenden. In the pig competitions the principal winners were the Earl of Ellesmere, Mr. C. R. N. Beswicke-Royds, who divide the honours. Three first-class prizes were, however, carried off by Halifax men, Mr. George Spenceley, Mr. John Holdsworth, and Mr. John Ingham. A district competition, open to working men, was encouraged by the presentation of two cups, and the chance of four others, open to nearly all exhibitors. Mr. Allen

Coates, Sheffield, and Mr. Joseph Richardson, Halifax were winners of medals. Mr. Thomas Stamper, Oswald-wistle, and Mr. Stephen Barratt, of Leeds, made the awards. There was a good show of implements, there being in the yard 179 entries. The judges, Mr. H. Ambler and Mr. John Smith, Halifax, awarded silver medals to T. Rhodes, Halifax, for a Singer sewing machine; to Hartley and Sugden, Halifax, for a chaff cutter; and to J. Howorth, Farnworth, for an 11 in. diameter revolving archimedean screw ventilator.

THE AMALGAMATED MANCHESTER AND LIVERPOOL AND ROYAL NORTH LANCASHIRE AGRICULTURAL SOCIETY.

MEETING AT STALYBRIDGE.

The entries, notwithstanding the amalgamation, were not so numerous as those of the Liverpool Society, at Chester, in 1873; but in the chief feature, that is the Shorthorn section, the classes were well filled. The first prize in the aged bulls went to Lord Irwin, who has now travelled upwards of 1,200 miles in meeting engagements; and besides the first prize in its class Lord Irwin was awarded the £10 cup for the best bull in the yard; but much of the interest in this class evaporated when it was found that Telemachus was not in the ring; and the second prize went to Royal Lancaster, exhibited by Mr. Edward Musgrove, Oughton, Ormskirk; with the third prize to Mr. Linton's Sir Arthur Ingram, a two-year-old bull, which, by the conditions, was pitted against veterans. The propriety of an alteration in the rule was further shown by Mr. Outhwaite's Lord Godolphin, which being now two weeks over two years old, was shown in the class of aged bulls. There was a small entry of bulls between one and two years old, where the first prize was awarded to Rapid Rhone, and Lady Pigot was third in the same class with May King, the second prize going to Telemachus 6th. There was a small entry of bull-calves, the first prize going to Mr. Thomas Statter for Hero. Ten entered in the class of aged cows; the first prize being Vivandiere, to which was also awarded the £10 cup for the best cow or heifer over two years old in the yard; while Mr. Statter was second and third with Lady Graceful and Lady Ann against the Marquis of Exeter and Lady Pigot. Another Lancashire exhibitor won in the class of two-year-old heifers with Royal Rose, and Rose of Wytham again followed Royal Rose, though Rosalbina 6th, shown by Mr. Statter, and bred by Mr. Dickinson, Wigan, was placed third. In the class of yearling heifers the honours were awarded to Robin's Rose, shown by Mr. Statter, and to Lady Pigot, with Rose of Lincoln and Princess Wytham; while Lady Pigot was first in a fair class of calves. The premiums which the Society offers for Shorthorns exhibited by tenant-farmers principally dependant upon farming, and resident in the Society's district, did not bring a good entry, while the other breeds included Alderneys, Ayrshires, and Welsh.

The horse classes were but indifferently filled, the more especially as tested by the amount of competition. For thoroughbred stallions suitable for getting hunters or carriage horses the class ran to six entries. The first prize was awarded to Laughingstock, and the second to Messrs. Ambery and Cockin, Feathers Inn, Manchester, for Kidderminster. The roadster stallions reached only to five entries, with the prize awarded to Shepherd F. Knapp, the second to J. Gill; the roadsters above 14 hands had seven, and only four cobs were entered. Prize money amounting to £23 was offered for carriage or harness horses, but the

class, numbering four, was very indifferent, and only one prize was awarded; while of single-harness horses of any age there were only three exhibitors. In the class for hunters, equal to carry 14 stone, Mr. Joseph Fearon's Erl King beat Mr. W. Armstrong's Cashier! and Loiterer, shown by Messrs. W. Thompson and Son, was put third. In the class for hunters up to 12 stone, the first prize was given to Jester, shown by Mr. T. H. Hutchinson, of Catterick, for which, as the best hunter in the yard, the £25 cup was also awarded. Prizes were offered by the Staleybridge local committee for hunters shown by residents within the local district, which commanded a fair entry.

The sheep classes included some good Shropshires from Messrs. Baker, Nock, and Firmstone; and a very mixed lot in the longwool classes of Leicesters, Lincolns, and Cotswolds; Mr. Hutchinson, of Catterick, having a long lead with his capital type of Leicester, and taking all the chief prizes alike for rams and ewes. The competition here again was in fact but indifferent, and the local display of sheep simply noticeable as a curiosity. The pig show was stronger, supported as it was by many of our most famous exhibitors, including, as the prize-list will tell, Messrs. Howard, Duckering, Royds, Matthew Walker, Peter Eden, Wheeler, Lord Ellesmere, and Mr. Rose, a new exhibitor from Norfolk.

Over what *The Manchester Examiner* calls "the sometimes too much neglected implements," money prizes are given in very few instances, but the distribution of silver medals was duly appreciated by the successful exhibitors.

PRIZE LIST.

JUDGES.—SHORTHORNS: G. H. Sanday, Bedale; T. Dodds, Wakefield. OTHER BREEDS OR CROSS-BREDS: J. Roberts, Saltney; J. Gardner, Worsley, Manchester. LIGHT HORSES: W. S. Atkinson, Leeds; J. Bromley, Lancaster. CART HORSES: R. S. Reynolds, Liverpool; T. J. Rider, Kenwick, Shrewsbury. SHEEP: C. Byrd, Littywood; E. Riley, Kipling Coates. PIGS: J. Birch, Sefton; J. Fisher, Cross Hills. POULTRY: —, Teebay, Fullwood. PIGEONS: M. Hedley, Redhill. DOGS: M. Hedley; R. Gorton, Eccles; W. Lort, Birmingham. HARRIERS: C. B. Speight, Stannington; S. Ridge, Sheffield. FARM AND GARDEN PRODUCE: E. Rothwell, Winwick; J. Hornby, Minshull Vernon. CHEESE: R. Pedley, Crewe. BUTTER: G. Jennison, Belle Vue, Manchester; T. Muirhead, Manchester. IMPLEMENTS: J. Wright, Croxteth; R. Maudsley, Eccleston; R. T. Smith, Whitechurch.

CATTLE.

SHORTHORNS.

Bull, above two years old.—First prize, £15, and extra prize, R. Bruce, Newton-of-Struthers, Forres (Lord Irwin); second, £10, E. Musgrove, Anghton, Ormskirk (Royal Lancaster); third, £5, W. Linton, Sheriff Hutton, York (Sir Arthur Ingram). Highly commended: J. Outhwaite, Bainesse, Catte-

rick (Lord Godolphin). Commended: B. St. John Ackers, Painswick (Cymbeline).

Bull, above one but under two years old.—First prize, £15, Lady Pigot, Branches Park (Rapid Rhone); second, £10, Marquis of Exeter, Barghley Park (Telemachus 6th); third, £5, Lady Pigot (May King).

Bull calf, above six and under twelve months old.—First prize, £6, T. Statter, Stand Hall (Hero); second, £4, J. Coates, Hartstead, Cleckheaton; third, £2, R. Thompson, Mythorpe Lodge, Blackpool (Winsome's Heir).

Cow, above three years old, in milk or in calf.—First prize, £8, and extra prize, J. Outhwaite, Bainesse (Vivandiere); second, £6, T. Statter (Lady Graceful); third, £4, T. Statter (Lady Ann). Highly commended: Marquis of Exeter (Sea Gull).

Heifer, two years old but under three.—First prize, £8, J. Thom, Larkhill, Chorley (Royal Rose); second, £6, Lady Pigot (Rose of Witham); third, £4, T. Statter (Rosalbina 6th). Commended: B. St. John Ackers, Painswick (Queen of the Georgians).

Heifer, above one but under two years old.—First prize, £6, T. Statter (Robin's Rose); second, £4, Lady Pigot (Rose of Lincoln); third, £2, Lady Pigot (Princess of Witham). Highly commended: T. Statter (Robin's Stauley Rose).

Heifer calf, above six but under twelve months old.—First prize, £5, Lady Pigot (Moorish Captive); second, £3, G. Fox, Harefield (Lady Faverley 6th); third, £2, W. J. Legh, M.P., Lyme Park, Disley (Jessamin). Commended: B. St. John Ackers (Lady Carew).

OTHER BREEDS.

Channel Islands bull, of any age.—Silver medal, T. H. Miller, Poulton-le-Fyde (Mentor). Highly commended: R. H. Norreys, Davey Hulme Hall.

Ayrshire bull of any age.—Silver medal, T. Statter.

Welsh bull of any age.—Silver medal, R. Humphreys, Beddgelert (Prince Llewelyn).

Channel Islands' cow or heifer of any age.—First prize, £5, A. Hall, Cleckheaton; second, £3, R. Smith, The Poplars, Manchester. Commended: T. H. Miller, Singleton Park (Maid of the Mist).

Ayrshire cow or heifer, of any age.—First prize, £5, T. Statter (Dairymaid); second, £3, T. Statter (Buttercup).

Welsh cow or heifer, of any age.—First prize, R. Humphreys; second, £3, G. Jones, Mold (Pride). Commended: R. Humphreys.

LOCAL PRIZES.

A piece of plate, value £10, to the best bull in any of the foregoing classes, for Lord Irwin.

Ditto, value £5, to the best cow or heifer above two years old, for Vivandiere.

Ditto, value £5, to the best heifer or heifer-calf under two years old, for Robin's Rose.

HORSES.

Young horses for road and field, three years old, gelding or filly.—First and second prizes, C. E. Ashworth, Fairfield, Manchester; third, J. F. Crowther, Knowl Grove, Mirfield.

Two years old, gelding or filly.—First prize, T. F. Jackson, Tattenhall Hall, Chester; second, J. F. Crowther.

Cart horses (open), stallions for getting cart or waggon horses (price money £45).—T. Statter, Stard Hall; second, F. Crowther; third, R. Hopper, North Bank, Whittlesey, near Peterborough.

Stallion colts, foaled in 1871.—First prize, J. and J. Wyde, Worth Hall, Poynton, Stockport; second, T. Statter.

Stallion colts, foaled in 1872.—This was a poor class and only the third prize was awarded, to J. Gould, Hyde Hall, Denton.

Stallion colts, foaled in 1873.—First prize, T. Statter; second, J. F. Crowther; third, J. Tomlinson, Lutton Marsh.

Pairs of horses, mares, or geldings, for farm work, property of tenant-farmers principally dependent on farming.—First prize, W. Birch, Aintree, Liverpool; second, J. Partington, Whittalfold, Birch, Middleton.

Cart horse, four years old, or upwards, mare or gelding, property of tenant-farmers principally dependent on farming.—First prize, H. Nield, Worsley; second, J. Waterworth, North Ashton, Wigan; third, J. Pover, Elton Hall, Chester.

Pairs of waggon horses, mares or geldings, most suitable for heavy town work.—First prize, T. George, Wellington Saw Mills; second and third, C. W. Brierley, Rhodes House, Middleton.

Cart or van horse, four years old or upwards, mare or gelding.—First prize, C. W. Brierley; second, T. Statter; third, J. W. Crosby, Crosby Green.

Van horse, four years old or upwards, mare or gelding.—Prize, C. W. Brierley (only entry).

Young horses, three years old, cart breed, gelding or filly.—First prize, G. Prescott, Minshull Vernon, Middlewich; second, W. Birch, Aintree; third, E. Waterworth, Brimelow Farm, Wigan.

Two years old, cart breed, gelding or filly.—First prize, J. Walsh, Moss House, Upper Rawcliffe, Garstang; second and third, T. Seed, Bashall Town, Clitheroe.

One year old, cart breed, gelding or filly.—First prize, T. Statter; second, J. and F. Crowther.

Brood mares, cart mare with foal at foot.—First prize, J. Tomlinson, Sutton Marsh (foal and mare); second, T. Statter (foal and mare).

Stallion for getting cart or waggon horses, which has served mares in the local district during the season 1874.—Prize, W. Chantler, Hurst Nook, Ashton. A medal was awarded to T. Statter for extra stock.

Pair of horses, mares or geldings, the property of a tenant-farmer principally dependent on farming.—Prize, J. Hyde, Denton (only one entry).

Cart horse, four years old and upwards, mare or gelding, the property of a tenant-farmer principally dependent on farming.—Prize, L. Hyde, Hartshead, Ashton-under-Lyue (only one entry).

Cart horse, four years old or upwards, mare or gelding.—First prize, T. George; second, T. A. Harrison, Stalybridge.

Young horses, three years old gelding or filly.—Prize, D. Adamson, Newton Heath, Hyde.

Two years old gelding or filly.—Prize, J. Bardsley, Birches Farm, Lees.

One year old colt or filly.—Prize, H. Smith, Bagshaw Farm, Glossop.

Brood mare, for breeding horses suitable for farm work, with foal at foot.—First prize, J. Bardsley; second, C. Stocks, Cheadle.

Thoroughbred mare, with foal at foot.—First prize, S. Kirby, 3, City-terrace, City-road, Manchester; second, L. Rawstorne, Hutton Hall, Preston.

Halfbred mare, for road or field, with foal at foot.—First prize, S. Kirby; second, J. F. Crowther, Knowl-grove, Mirfield. Highly commended: B. Bee, Bullsnape Hall.

(Local prizes given by the Stalybridge local committee for residents within the local district.)

LIGHT HORSES.

Stallion, for getting weight-carrying hunters or roadsters, having served mares within the local district during the season 1874.—Prize, W. Laycock, Crows'-ith-Wood, Staley, Staleybridge.

Roadsters, four years old, mare or gelding, above 14 hands 2 inches.—First prize, W. Sidebottom, Etheron House, Hollingworth, Hadfield; second, Lucy H. Sidebottom, Etheron House.

Cobs, mare or gelding, above 13 but under 14 hands 2 inches.—Prize, R. Heap, Brun Micklehurst, Mossley.

Pony, mare or gelding, not over 13 hands.—Prize, T. Hall, Hollingworth.

YOUNG HORSES FOR ROAD OR FIELD.

Three-year-old-gelding or filly.—Prize, G. Kay, Sidebottom Fold, Stalybridge.

Two-year-old colt or filly.—First prize, H. Smith, Bagshaw Farm, Glossop, Derbyshire; second, R. Bridwake, Delph, Saddleworth.

One-year-old colt or filly.—First prize, T. Ashton Harrison, Stalybridge; second, A. Holt, Limehurst Farm, Ashton-under-Lyue.

Brood mare, for road or field, with foal at foot.—First prize, M. H. H. Bardsley, Ashton-under-Tyue; second, J. Bottomley, Hill Top, Stalybridge.

SHEEP.

(Open for competition to the United Kingdom.)

SHROPSHIRE DOWNS.

Shearling ram.—First prize, T. Rigby, Daruhall Mill Farm; second, W. Baker, Moor Barns, Atherstone; third, T. Nock, Sutton House, Shifnal, Salop.

Ram of any other age.—First prize, W. Baker; second, W. F. Firmstone, Rockingham Hall, Hagley, Worcestershire; third, T. Rigby.

Ram lamb.—First prize, T. Nock; second, W. Baker; third, T. Nock.

Three shearing ewes.—First prize, W. Baker; second, T. Nock; third, W. F. Firmstone.

Three ewes, having reared lambs this year.—First prize, W. Baker; second, W. F. Firmstone; third, T. Nock.

Three ewe lambs.—First prize, T. Nock; second, W. Baker; third, T. Nock.

LONG-WOOLLED OF ANY BREED.

Shearling ram.—First, second, and third prizes, T. H. Hutchinson, Manor House, Catterick.

Ram of any other age.—First and second prizes, T. H. Hutchinson; third, W. Norman, Hall Bank.

Ram lamb.—First prize, W. Norman; second, J. T. Clifton, Lytham Hall; third, T. H. Hutchinson.

Three shearing ewes.—First and second prizes, T. H. Hutchinson.

Three ewes having reared lambs this year.—First and second prizes, T. H. Hutchinson; third, W. Norman.

Three ewe lambs.—First prize, T. H. Hutchinson; second, J. T. Clifton; third, W. Norman.

Three Cheviot ewes of any age.—First and second prizes, T. Roddick, Pembew.

Three half-bred Cheviot lambs, ewe or wether.—Prize, H. Smith, Blackshaw Farm, Glossop, Derbyshire.

LOCAL PRIZES.

(For residents within the Stalybridge district.)

White-faced horned ram of any age.—Prize, R. Heap, Micklehurst, Mossley.

Pen of not less than five white-faced ewes of same breed.—First prize, R. Heap; second, D. Heap, Micklehurst, Mossley.

Pen of not less than five white-faced wethers of same breed.—First prize, D. Heap; second, R. Heap.

Black or speckled-faced horned ram.—Prize, R. Heap.

Pen of not less than five ewes of same breed.—First prize, R. Heap; second, W. Nield, Hollingworth Hall.

Pen of not less than five wethers of same breed.—Prize, R. Heap.

Pen of not less than five store sheep of any other variety.—Prize, W. Nield.

PIGS.

(Open for competition to the United Kingdom.)

Boar of large white breed, above one year old.—First prize, J. and F. Howard, Britannia Farms, Bedford; second and third, C. R. N. Beswicke-Royds, Pyke House, Littleborough.

Breeding sow of large white breed, above one year old.—First prize, C. R. N. Beswicke-Royds; second, Earl of Ellesmere; third, R. E. Duckering.

Boar pigs of large white breed, under one year old.—First and second prizes, M. Walker, Stockley Park; third, R. E. Duckering.

Pair of sow pigs, large white breed, under one year old.—First prize, Earl of Ellesmere; second, C. R. N. Beswicke-Royds; third, P. Eden, Cross Lane, Salford.

Boar of small white breed, above one year old.—First prize, Earl of Ellesmere; second, C. R. N. Beswicke-Royds; third, R. E. Duckering.

Breeding sow, white breed, above one year old.—First prize, Earl of Ellesmere; second, C. R. N. Beswicke-Royds.

Boar pig, white breed, above one year old.—First prize, P. Eden; second, M. Walker; third, R. E. Duckering.

Pair of sow pigs, white breed, above one year old.—First prize, C. R. N. Beswicke-Royds; second, Earl of Ellesmere.

Breeding sow of the middle breed, above one year old.—First prize, Earl of Ellesmere; second, R. E. Duckering; third, C. R. N. Beswicke-Royds.

Boar pig of the middle breed, under one year old.—First prize, P. Eden; second, R. E. Duckering; third, H. Nield.

Pair of sow pigs of the middle breed, under one year old.—First prize, P. Eden; second, C. R. N. Beswicke-Royds.

Boar of the Berkshire breed, above one year old.—First prize, Mrs. Cunliffe, Darnhall Hall; second and third, J. Wheeler, Long Compton.

Breeding sow of the Berkshire breed, above one year old.—First prize, M. Walker; second and third, J. Wheeler.

Pair of sows of the Berkshire breed, under one year old.—First prize, Mrs. Cunliffe; second, J. Wheeler.

Boar, improved Essex, above one year old.—First prize, T. Rose, Meltham Magna, Norfolk; second and third, C. R. N. Beswicke-Royds.

■ Breeding sow, improved Essex, one year old.—First prize, C. R. N. Beswicke-Royds; second, J. Wheeler; third, R. E. Duckering.

Pair of sows, improved Essex, under one year old.—First prize, C. R. N. Beswicke-Royds; second, T. Rose; third, C. R. N. Beswicke-Royds.

Boar of any breed belonging to landlords in the district.—Prize, silver medal, W. J. Leigh, M.P., Lyme Park.

LOCAL PRIZES.

Boar of large breed.—First prize, H. Garside, Stalybridge; second, R. Dyson, Stalybridge.

Boar of small breed.—First prize, W. Winterbottom, Dukinfield; second, R. Brierley, Stalywood.

Sow of large breed.—First prize, R. Worthington, Mottram road; second, E. Ford, Lunzley End.

Sow of small breed.—Prize, R. Worthington.

Litter of sucking pigs (with sow), under ten weeks old.—First prize, W. Williamsou, Dukinfield; second, R. Worthington.

Fat pig, any age.—Prize, J. Byrom, Commercial Ino, Staley.

Pair of store pigs, under ten months old.—First prize, J. Turner, Hollingworth, Hadfield; second, J. Bottomley, Hill Top, Staley.

GRAIN AND ROOTS.

White wheat.—First prize, W. A. Gray, Dawpool, Birkenhead; second, J. Cornes, New Farm, Hurlston.

Yellow or red wheat.—First prize, T. Rigby, Darnhall Mill Farm, Winsford; second, J. Cornes.

Any variety of white oats.—First prize, P. McGregor, Onston; second, J. Greatorex, Stretton.

Any variety of yellow oats.—Prize, H. Nield, The Grange, Worsley.

Black oats.—First prize, W. A. Gray, Dawpool; second, H. Neild.

Any variety of barley.—First prize, J. Greatorex; second, W. K. Fowler, Prebendal Farm, Aylesbury.

Any variety of beans.—First prize, J. K. Fowler; second, W. A. Gray.

Six roots Swedish turnips of any kind.—First prize, J. K. Fowler; second, S. Taylor.

Six roots of any other kind of turnips.—First prize, G. Smith, Flash Green Farm, Wheelton, near Chorley; second, G. Ashburne, Low Hall, Broughton-in-Furness.

Six roots of long red mangel wurtzel.—First prize, J. K. Fowler; second, J. Greatorex.

Six roots yellow mangel wurtzel.—First prize, J. K. Fowler; second, J. Greatorex.

Six roots of any kind of globe manuel wurtzel.—First prize, J. K. Fowler; second, J. Greatorex.

Six carrots, any variety.—G. Smith, Flash Green Farm; second, H. Simcock, Brighton Grange.

Two Scotch cabbages.—First prize, J. Greatorex; second, H. Neild.

Samples of twenty round potatoes.—First prize, J. Rigby, Spindle Hall Farm, Farrington, Preston; second, J. Taylor, Malpas, Cheshire.

Samples of twenty flat potatoes.—First prize, G. Smith; second, J. Taylor.

Collections of farm and garden produce of any kind, the bonâ fide growth or manufacture of exhibitor.—First prize, T. F. Jackson, Tattenhall, Chester; second, H. Simcock, Brighton Grange, Barton Moss; third, F. Lythall, Offchurch, Leamington.

CHEESE.

Four cheeses, any colour, above 50lb. each.—First prize, G. Prescott, Minshall Vernon, Middlewich; second, J. Robinson, Lee Green Hall, Middlewich; third, J. Cornes, New Farm, Hurlston.

Four cheeses, under 50lb.—First prize, W. Mocton, Acton Hill, Northwich; second, J. Beckett, Becliton Lawton, Cheshire; third, R. Prescott, Iddinshall Hall.

Three cheeses (for residents within the Stalybridge local district).—First prize, W. Nield, Hollingworth Hall, near Hadfield; second, R. H. Ashton, Roe Cross, Mottram.

BUTTER.

Six half-pounds of fresh butter (for residents within the Stalybridge local district).—First prize, cup, J. Marson, Acton Trussell, Stafford; second, H. Nield, The Grange, Worsley; third, S. W. Wildman, Park House, Shaw; fourth, J. Lloyd, Rhuallt, St. Asaph, Flintshire.

Six half-pounds of butter, made by exhibitors resident in the local district.—First prize, R. Jaffrey, Oak Farm, Stalybridge; second, Mrs. M. Heginbotham, Shepley Farm, Hooley Hill; third, A. Holt, Limehurst Farm, Ashton-under-Lyne; fourth, W. Kirkham, Boar Fold, Stalybridge.

IMPLEMENTS.

Best arranged machinery for preparing food for farm stock, to be exhibited in motion at work.—First prize, S. Corbett and Son, Park-street Works, Wellington, Salop; second, Picklesy, Sims, and Co., Bedford Foundry, Leigh; medal, Richmond and Chandler, Salford; medal, A. Woods and Cocksedge.

Collection of farm implements and tools.—First prize, Richmond and Chandler; second, Standing, Preston.

Articles of domestic use.—First prize, T. Bradford and Co., Cathedral Steps, Manchester; second, R. Sykes, Stalybridge.

Dairy vessels for butter and cheese-making.—First prize, G. Llewellyn and Son, Haverfordwest, Pembrokeshire; second, W. and F. Richmond, Colne, Lancashire.

Useful articles in slate.—First prize, Belcher, Gee, and Co., Gloucester; second, Lewis, Ford, and Co., Bristol Road, Gloucester.

Best assortment of stable and cowhouse fittings.—Prize, Musgrave and Co., Belfast.

Silver medals.—Richmond and Chandler, Salford, for a chaff-cutter; Harrison, M'Gregor, and Co., Leigh, for a two-horse Albion combined mower and reaper, and for a chaff-cutter; Osborne and Co., Liver-

pool, for a collection of agricultural implements by American manufacturers; J. Fowler and Co., Leeds, for six-horse traction engine; T. Standing, Preston, for Coultas' improved 6 ft. 6 in. 12-row corn and seed drill; David Harkes, Mere, Knutsford, for a drill plough; Ransomes, Sims, and Head for a six-horse power portable steam engine; R. Hornsby and Sons, Grantham, for a spring balance self raker; Fallows and Bate, Manchester, for a lawn mower; Picklesy, Sims, and Co., for their general collection; Corbett and Peel, Shrewsbury, for a clover and seed barrow drill; W. Rainforth and Son, Lincoln, for their collection; S. Corbett and Son, Wellington, for the best mode of fastening the mouldboard to a ridge plough; J. Bragcins, Banbury, for patent hangings for carriage gate; W. Milburn, Manchester, for a combined vertical steam engine and boiler; Wheeler and Wilson Company, Manchester, for a sewing machine, designed especially for heavy manufacturing purposes, tailoring, and leather work; R. Jones, Liverpool, for a collection of sporting guns; R. Sykes, Stalybridge, for kitchen-ranged grates; G. Cheaven, Boston, for a collection of filters; J. Crowley and Co., Sheffield, for an arm-stopping motion in a hayentter; J. Edwards, Manchester, for leather machine bands; Dobson Brothers and Wormald, Leeds, for a double-reel sewing machine; Hodgson and Stead, Salford, for a collection of weighing machines.

HUNTINGDONSHIRE AGRICULTURAL SOCIETY.

MEETING AT ST. NEOTS.

The total number of entries was 592, against 526 last year and 413 in 1872, showing an increase of over 60 compared with 1873. The show of horses was good, especially the hunters. The total number of horses entered was 153, against 141 last year. Mr. J. Goodliff, of Huntingdon, was very successful as an exhibitor of horses; for he was awarded as many as five cups, and Marshal McMahon took the Duke of Manchester's silver cup, while Lady Mary carried off both cups, the owner being both exhibitor and breeder. Mr. Hayward, of Southill, took the £25 cup with Richelieu, and the horses on the whole were the best exhibition ever seen at this show. The entry of horned stock was not quite so large as last year. The 20 gs. cup for the best bull was secured by Mr. W. Dolby, of Bingley, Yorkshire, against sixteen exhibitors, and the piece of plate for the best cow or heifer, value 20 gs., by Mr. Dolby also. The show of sheep was not so large as last year, the number of entries only 36. The £10 cup for the best pen of ewes was carried off by Mr. T. Gunnell, who also took the £5 cup for the best pen of lambs. There was a fair show of pigs, and the root show was quite up to the average. There was a small show of implements; and the ploughing matches were again dispensed with.

PRIZE LIST.

JUDGES.—CART-HORSES: J. Coates Sharpley, Kerstern Hall, Louth; J. Plowright, Manea, Isle of Ely. RIDING HORSES: J. Martin, Wainfleet; J. Plowright, Manea; J. Bennett, Husbands Bosworth. BREEDING AND STORE STOCK: F. Dunn, Weston, Shipton-on-Stour; E. A. Fawcett, Childwick Hall, St. Alban's. SHEEP AND PIGS: T. Cartwright, Dunstan Pillar, Lincoln; H. Overman, Weasenham, Norfolk.

HORSES.

Cart stallions (open to all England).—First prize, £15, R. Hopper, Whittlesey; second, £7, J. Smalley, Whittlesey.

Cart mares suckling foals (open to all England).—First prize, cup, value £10, J. Warth, jun., Chatteris; second, £3, R. H. Ekins, Wennington.

Two-year-old cart geldings.—First prize, £6, S. Fyson, Warboys; second, £3, S. Fyson.

Two-year-old cart fillies.—First prize, £6, W. Nix, jun., Somersham; second, £3, T. H. Vergeste, Boro' Fen.

Cart foals.—First prize, £2, R. H. Ekins; second, £1, J. Hall, Little Barford, St. Neots.

Pair of cart-horses.—Prize, cup, value 5 gs., Mr. Fyson.

Hunting mares or geldings, above three or under four years old.—Prize, cup, value 10 gs., as breeder, and a cup, value 5 gs., as owner, J. Goodliff, Huntingdon.

Hunting mares or geldings, above four and under five years old (open to all England).—Prize, cup, value £25, Mr. Hayward, Southill, Biggleswade.

Hunting mares or geldings, five years old or upwards (open).—Prize, cup, value 20 gs., J. Goodliff.

Mares and foals for hunting purposes, the foals by thoroughbred stallions.—First prize, cup, value £10, J. Goodliff; second, cup, value £5, J. Goodliff.

Roadster mares or geldings, above four and under five years old, and not exceeding 15 hands 1 inch (open).—Prize, cup, value £10, Mr. Tebbutt, Bluntisham, St. Ives.

Roadster mares or geldings, above five years old, over 14 hands and not exceeding 15 hands 2 inches (open).—First prize, cup, value £5, T. Banyard, Horningsea, Cambs; second, £3, S. Day, St. Neots.

Hackney mares, not exceeding 15 hands 1 inch.—Prize, £5, J. Topham, Great Staughton.

Hackney cobs, not exceeding 14 hands.—Prize, cup, value 5 gs., W. R. Cockle, Hill-row, Haddenham, Ely.

Ponies, not exceeding 13 hands.—Prize, 2 gs., J. Goodliff.

Mares or geldings, not less than 14 hands, with action and pace in harness.—Prize, cup, value 5 gs., J. Benton, Somersham.

Mares or geldings, for jumping.—Prize, cup, value £5, W. and A. T. Wagstaff, Olford, Cluney.

CATTLE.

Bulls not under two years old.—First prize, £8, Mr. Wood, Clapton, Thrapston; second, £4, T. Smith, Tilbrook.

Bulls under two years old.—First prize, £6, J. J. Sharp, Broughton, Kettering; second, £3, B. Brown, Huntingdon.

Cows of any age, in milk or in calf.—First prize, £5, J. J. Sharp; second, £3, S. Armstrong, Shingay, Royston.

Cows of any age adapted for dairy purposes, and not eligible to be entered in the Herd-book.—First prize, silver inkstand value 10 gs., G. E. Daintree, Fenton; second, £3, Mr. Looker, Wyton Manor.

Heifers under three and over two years old.—First prize, £4, Mr. Looker.

Heifers under two years old, and not eligible to be entered in the Herd-book.—First prize, £3, B. Brown; second, £1 10s., C. Daintree.

Heifers under two years old.—First prize, £3, J. J. Sharp; second, £1 10s., C. Daintree.

Steers under three and over two years old.—First prize, £5, Mr. Sisman, Buckworth Lodge, Hunts.

Steers under two years old.—First prize, £3, C. Daintree; second, £1 10s., Mr. Sisman.

Pair of steers of any age or breed, not being Shorthorns.—First prize, £4, C. Hall, Eaton Socon; second, £2, Mr. Sisman.

Bulls (open to all England).—Prize, cup, value 20 gs., W. Dolby, Bingley, Yorkshire.

Cows or heifers (open).—Prize, piece of plate, value 20 gs., W. Dolby.

SHEEP.

LONG-WOOLS.

Three shearing wethers.—First prize, £4, T. Gunnell, Milton, Cambs; second, £2, J. Looker, Hemmingford Abbots.

Five ewes that have suckled lambs to the 1st of June last.—First prize, £4, T. Gunnell; second, £2, J. T. Roseblade, Hiltun, Hunts.

Five wether lambs.—First prize, £4, T. Gunnell; second, C. Daintree.

Five ewe lambs.—First prize, £4, T. Gunnell; second, £2, J. T. Roseblade.

Five top lambs.—First prize, £4, T. Gunnell; second, £2, Mr. Looker, Wyton Manor.

SHORT-WOOL OR MIXED BREED.

Three shearing wethers.—Prize, £4, W. Wells, Holme Wood House, Hunts.

Five ewes that have suckled lambs to the 1st of June.—First prize, £4, Mr. Street, Harrowden House, near Bedford; second, £2, J. Hall, Little Barford, St. Neots.

Five wether lambs.—First prize, £4, W. Wells; second, £2, J. Hall.

Five ewe lambs.—Prize, £4, F. Street.

Best pen of ewes exhibited in the foregoing classes.—Prize, cup, value £10, T. Gunnell.

Best pen of lambs exhibited.—Prize, cup, value £5, T. Gunnell.

Best ram (open to all England).—Prize, cup, value £10, W. F. Marshall, Branston, Lincoln.

PIGS.

Boars, large breed.—First prize, £3, Hou. C. W. W. Fitzwilliam, M.P. Allwaton, Peterboro; second, £1 10s., Duke of Manchester, Kimbolton Castle.

Boars, small breed.—First prize, £3, Earl of Carysfort, Elton Hall; second, £1 10s., Mr. Deacon, Polebrook Hall.

Breeding or suckling sows, large breed.—First prize, £3, J. Looker; second, £1 10s., Mr. Deacon.

Breeding or suckling sows, small breed.—First prize, £3, Mr. Deacon; second, £1 10s., Earl of Carysfort.

Three yelts over six and under twelve months old.—First prize, £3, J. Looker; second, £1 10s., J. Looker.

Best animal exhibited in the pig classes.—Prize, cup, value £5, J. Looker.

At the dinner, Mr. E. FELLOWES, M.P., the Chairman, wished to congratulate his agricultural friends upon the harvest they had seen that day. They had had a most satisfactory harvest, and, thanks to God, they had had magnificent weather to gather in their crops, so that they had reason to be thankful. But he thought he heard them reminding him of the low price of wheat. Well, the price had undoubtedly gone down, but they would hope that the fall was not a permanent one, but that wheat would be at such a price as to be remunerative to the farmer and advantageous to the consumer. He thought and hoped he might also congratulate them upon the termination of those disagreeable feelings which had existed for some little time between the employers and their labourers. He was in great hopes that that was now terminated. He hoped that

the labourers had found now who were their best friends. He trusted that they had found that Mr. Arch and those people who went about the country setting class against class were not the real friends of the agricultural labourer. He thought the labourers had learnt that, although not without great loss. Their present experience had cost a good many of them a great deal. Many hundreds and thousands had been out of work a considerable time, and had gained nothing by it. He hoped he might say it was at an end. It was past, but perhaps there might be a little advantage in what had taken place to them all. The labourers deserved consideration, and whenever opportunity arose it should be shown to them. They must endeavour to show the labourers that they were their real true friends. They should endeavour to the utmost of their power, to advance the happiness, welfare, and prosperity of the labourer. He was far from saying that such was not the case. Those who recollected what the agricultural labourers were a few years ago, and recollecting the state they were then in, must observe the great improvement that has taken place in their condition in the last few years. The labourers might be told that the farmers were their enemies, but they would know that such was not the case. The recent circumstances through which they had passed ought to teach them to do what they could to promote the welfare of the labourer. There was a suggestion that would be sure to engage the attention of Parliament next session, and which was of considerable importance. If he were not convinced that it would be taken up by Parliament, he would have brought the matter before the attention of his brother landowners. He referred to the establishment of country friendly societies. That was a matter that he believed was of importance for the consideration of them all. He knew where they had been established, they had been attended with the most beneficial results. They were aware that there were various clubs existing, but he was afraid it was not always the case that these clubs were on a sound footing, and they had heard of such things as these clubs becoming insolvent. A young man entered one of these clubs early in life, contributed to its funds nearly all his life, and towards the close, when he hoped to derive some benefit from it, he found it was insolvent. This was a very great hardship. If friendly societies were established on a proper footing, and were governed by good rules, and based on proper tables, there would be no fear of such clubs becoming insolvent, but would be a great benefit to the labouring classes. If it was taken up as a county matter he believed the labourers would largely support it. If they had a large area over which the society would spread it would be successful and would confer great benefit. What they wanted to do was to instil into the minds of the labourers a spirit of frugality and independence. At the present time, if one of these men became sick or old, he had to go to the Union and be supported at the expense of the rates. What they wanted to do was to make a man provident, to make him feel that when he is ill or old, he can go on the funds of his club as a right. The great advantage of the clubs was that they induced men to lay by a small allowance every week or month towards sickness and old age. He believed that if the matter was taken up by landowners generally and a good fund provided to fall back upon, there would be no want of confidence on the part of the labourers, but that they would much more readily become members than they did of the present societies. About two years ago the Speaker had called upon his labourers to invest their money in his farm, and he promised they should have part of the profits. It sounded all very well in theory, but he believed at the time and still believed that it was impracticable. He wished to pay great deference to the opinion of the right hon. gentleman, but he thought he had made a very great error, and had proved that himself, as he had said that he was very sorry to say he had not received one single application from any of his labourers. At the same time, Mr. Brand still held out the offer that he would receive the money in the concern and share the profits with them proportionately. How those profits were to be arrived at he did not know. At all events to that day no single application had been made, nor did he believe it would, or if it were that it would be beneficial to either the employer or the labourer. On the contrary, he thought it would throw down the apple of discord, and would do a great deal of harm. What they wanted was to promote harmony and good will, and instead of that it would produce just the reverse, and the sooner his right hon. friend dropped the whole question the better.

STOCK SALES.

SALE OF THE DUKE OF DEVONSHIRE'S SHORTHORNS.

AT HOLKER, ON WEDNESDAY, SEPTEMBER 9TH.

BY MR. H. STRAFFORD.

On the 9th of September, 1864, Mr. Strafford sold by auction at Holker a selection of nineteen cows and heifers and eleven bulls at an average of £66 3s., making a total sum of £1,984 10s. The highest-priced female was a red three-year-old Barrington heifer, Countess of Barrington 2nd, which Mr. Sheldon, of Brailes, bought for 135 gs. The highest-priced bull was Twelfth Duke of Oxford (19633), which Messrs. Adeock and Longland bought for 210 gs. Three Oxford bulls were sold at the same time for a total of 415 gs., but no Oxford females were offered. Ten years later, on the 9th of September, 1874, twenty-eight cows and heifers were sold at an average of £462 8s., and fifteen bulls at £236 13s. 6d., or a total of £16,497 12s. Are any further facts necessary to indicate the extraordinary rise in the value of high-bred stock? The Duke's herd is an old-established one, and its position in the Shorthorn world ten years ago was equal to what it is now. As far back as 1851 a portion of it was sold. The late Mr. John Colling's Rosey, one of the grandest cows of her day, went to Holker about '46, but the cow which elevated the herd was Oxford 15th. She was bought at Lord Ducie's sale at Tortworth, 1853, for 210 gs., and a large family has been reared at Holker from her and her offspring. Indeed, it has been the custom, until a few years back, to look to Wetherby for the Duchess blood and to Holker for the Oxford. Comparing, as far as one is capable of doing—for we are prone to think things better than they were by lapse of time—the cattle ten years ago were neater, deeper, rounder, and broader in their carcasses, and with sweeter heads and horns, than those shown last Wednesday. The frame appeared to be lengthened, and with it came a looseness of structure; many of the cows were forward in their shoulders, and very patchy, particularly in their hind-quarters; the head seemed larger and the horns darker coloured, longer, and outspreading. Two of the lots, Music and Minstrel, were of the old type, the latter being generally acknowledged the handsomest animal in the sale. The heifers, particularly the yearlings and some of the calves, were excellent, and fit to exhibit: they were mostly dark colours, reds or roans, and in excellent condition. Some of the calves were thin, especially two or three of the younger bulls.

The hotels in the surrounding district were full, and before the Askholme special train arrived there was a goodly company. The sale lots, except the calves and bulls, were grazing in the sale field, and about eleven the bulls were paraded. Three of the Barrington tribe were white, and much admired; level, thick, massive bulls they were, particularly the youngest, Barou Barrington 6th. Baron Winsome 3rd, a thick good roan, excellent in his fore-hand, was another favourite. It was rumoured that this bull was resold at a profit the following day to Lord Sudeley. Neither Baron Oxford 5th nor Duke of Nancy met with great public fancy, indeed the low price the Duke realised can hardly be taken as a test of his merit. Mr. Drewry had thought well enough of him to mate Winsome 12th with him, but the produce, a May bull-calf, only went for 48 gs., against 360 gs. for the dam.

Luncheon, although announced for one o'clock, commenced soon after twelve; it was laid for some hundreds in the schoolrooms, and a great squeeze took place to get in. The Duke presided, and after the loyal toast, Lord Duimore, as before, gave the Duke's health, which was very heartily received. Mr. Strafford's was also given, and it is but simple justice to say that the sale was as expeditiously as it was excellently conducted. The company was much divided, and taking a careful survey of the numbers, five deep round the ring, in the rostrums, and in the conveyances, it was estimated that eight or nine hundred persons were assembled. Mr. Drewry supported Mr. Strafford, and with him were Mr. Leney, Mr. Fox, Mr. Longman, Mr. Barnes, and several others. The Duke and a large party of ladies were in a dray, with Sir John Whitworth on the box. Below, in Lord Bective's pony carriage, which had been specially sent over, was Capt. Oliver, and around him Mr. Holford, Mr. Sartoris, Mr. Sheldon, Mr. Beauford, Col. Kingscote, and many others. Lords Bective, Duimore, Feversham, and Cavendish, occupied another dray, and in the opposite rostrum the auctioneer's, Lord Chesham, Rev. P. Graham, Rev. Mr. Bradshaw, as well as others from Ireland, Mr. Coleman, and appropriately Mr. Thornton, and many others stood. The Bowness' bus contained the Storrs party, among whom were Mr. Booth, Mr. Pole Gell, Mr. Aylmer, and Mr. Jacob Wilson. Mr. Angerstein, Mr. Wilson, of Shotley, and Mr. Mitchell, of Scotland, were also here; while the Cumberland fashion of sitting inside the ring was naturally enough adopted by Sir Wilfrid Lawson, Mr. George Moore, and Mr. J. P. Foster; as also by Mr. Gow, Mr. Loder, Mr. Robinson, Mr. Ashburner, Mr. Crowdon, and other local breeders.

When the animals came into the ring the Oxford cows were certainly most in demand, and realised the highest prices. The sale opened with Grand Duchess of Oxford 6th, a red ten years old, rather patchy from years, but very massive, and half gone in calf. Having produced six heifers she might naturally be expected to continue this profitable career, and Mr. Frank Allen, of Thurmaston, got her at 805 gs. It was a great opening and indicated a high average. Mr. Sheldon gave 300 gs. for lot 2, another Barrington, nearly one sister to that which he bought ten years ago. Winsome 4th being amiss, was withdrawn, and her handsome yearling heifer substituted, when she went to Mr. Wilson, of Shotley, one of Mr. Bates' oldest friends, and who has had a herd of Shorthorns in Northumberland for nearly half a century. Then came the two crack lots of the sale, Grand Duchesses of Oxford 11th and 12th; the former, the dam of Lord Bective's 1,005 gs. heifer at the 1871 sale (although her dam was by the late Dr. Dickin-son's Priam of the Cressida blood), was one of the evenest and best Oxfords, and, after a 500 gs. start and brief competition, she soon realised a thousand, from Mr. George Moore. The other, Grand Duchess of Oxford 12th, had bred the two bulls of which Mr. Drewry had made a thousand guineas each; and it would seem a young cow, six and a-half years old, was worth more than the 1,010 gs. Mr. Brogden paid for her. In appearance, however, she differed much from the rest, being small and rather light-fleshed; still she looked like a bull breeder. As times go, Mr. Ashburner got a bargain in the two white Oxford heifers at 760 gs. and 675 gs. each.

Baroness Oxford 3rd was the "gem" of the young lots; and the public were justified in putting her as

the highest-priced animal. She was calved in November last—a handsome hairy red, and a grand-daughter of Lady Oxford 5th, one of the best Holker cows. Started at 500 gs., there was sharp bidding from various quarters till 1,000 guineas was reached, and Mr. Holford outbid Northumberland at 1,100 gs., getting her at least 100, or some said 400 gs., below the public estimate of her value. Still it was an excellent price for a calf, and a great improvement on her grand-dam's price, 600 gs., in 1867.

Of the Winsomes much might be written: they are large-framed good cattle, and rose considerably in value on former sales. Mr. Geo. Fox gave 700 gs. for a lovely heifer, Winsome 16th, fit to go into a Royal show. Sir Wilfrid Lawson gave 605 gs. for another heifer, Winsome 14th, and the twelve of the tribe sold averaged £333.

Many breeders have not hesitated to say that the Oxford Roses, or Rose of Raby tribe has produced some of the finest animals at Holker. Mr. Drewry has carefully guarded the tribe and kept them together from Sir Joseph Whitworth's sale. Mr. Longman effected a good stroke of policy in buying the entire tribe, saving a rather weedy one, which went to Wetherby, at an average of £237.

Towards the close of the sale of the cows and heifers the biddings certainly became flat; and more so at the finish, when several of the bull-calves went cheap. Whether the public, excited with the high prices made by the first few lots, suddenly became enervated and apathetic, or whether anticipating something better the next day at Underley, it is difficult to tell; nevertheless, the sale was dull, great as the averages afterwards proved. Forty-three head averaged £383 13s. 3d., against forty-three at £240 13s. 10d. in 1871, and with this enormous increase in the space of three years, there was a corresponding increase in the value of the tribe. Breeders did not, however, hesitate to express opinions that the Oxfords and Barringtons had somewhat declined in value and the Winsome had risen, notwithstanding any increase in value. Certainly the voice of the people was in favour of the Winsome tribe, and the wonderful result of the sale is strong evidence of the high position still maintained by the Holker herd.

COWS AND HEIFERS.

Grand Duchess of Oxford 6th, red, calved April 18th, 1864; by Imperial Oxford (18984), out of Grand Duchess of Oxford 4th.—Mr. Allen, Leicestershire, 805 gs.

Countess of Barrington 4th, roan, calved May 23rd, 1864; by Lord Oxford (20214), out of Countess of Barrington.—Mr. Shildon, Warwickshire, 800 gs.

Music, roan, calved October 14th, 1866; by Juryman (20043), out of Minstrel 3rd.—Mr. Postlethwaite, Whitehaven, 200 gs.

Winsome 4th, red, calved Dec. 2, 1866; by Grand Duke 10th (21848), out of Winsome.—Mr. T. Wilson, Shopley, 310 gs.

Grand Duchess of Oxford 11th, red, calved July 6th, 1867; by Grand Duke 10th (21848), out of Grand Duchess of Oxford 5th.—Mr. Geo. Moore, Whitehall, near Wigton, Cumberland, 1,000 gs.

Grand Duchess of Oxford 12th, rich roan, calved Feb. 28th, 1868; by 2nd Duke of Wetherby (21618), out of Grand Duchess of Oxford 7th.—Mr. Brogden, M.P., 1,090 gs.

Bright Eyes 5th, roan, calved May 4th, 1868; by Grand Duke 6th (19876), out of Bonny.—Lord Skelmersdale, 800 gs.

Winsome 5th, red and white, calved Oct. 19th, 1868; by Grand Duke 10th (21848), out of Winsome 2nd.—Lord Feversham, 350 gs.

Musical, roan, calved June 24th, 1869; by Grenadier (21876), out of Minstrel 3rd.—Sir Wilfrid Lawson, 360 gs.

Oxford Rose 3rd, roan, calved June 24th, 1869; by Baron Oxford 3rd (25579), out of Rose of Raby.—Mr. Longman, Herts, 250 gs.

Lady Blanche 3rd, roan, calved Feb. 23rd, 1870; by General Napier (24023), out of Lady Blanche.—Sir W. Lawson, 350 gs.

Severn Girl, red, calved March 6, 1871; by 3rd Duke of Clarence (23727), out of Severn Lady.—Mr. Postlethwaite, 130 gs.

Winsome 12th, roan, calved April 20, 1871; by Baron Oxford 4th (25550), out of Winsome 2nd.—Mr. Holford, Market Harborough, 360 gs.

Countess of Barrington 6th, roan, calved Nov. 24, 1871; by Baron Oxford 4th (25580).—Mr. Levy, 860 gs.

Carry 2nd, roan, calved Sept. 4, 1871; by Baron Oxford 4th (25580), out of Caroline.—Sir J. Whitworth, 205 gs.

Oxford Rose 7th, roan, calved Feb. 13, 1872; by Baron Oxford 4th (25580), out of Oxford Rose 2nd.—Mr. Longman, 305 gs.

Winsome 14th, roan, calved April 2, 1872; by Baron Oxford 4th (25580), out of Winsome 4th.—Sir W. Lawson, 605 gs.

Harmony, red and white, calved Oct. 9, 1872; by Prince of Lighthurne (29653), out of Music.—Mr. Foster, Kilhow, 200 gs.

Grand Duchess of Oxford 25th, white, calved Nov. 30, 1872; by Baron Oxford 4th (25580), out of Grand Duchess of Oxford 15th.—Mr. Ashburner, Ulverstone, 160 gs.

Maid of Lorne 2nd, red, calved April 16th, 1873; by Baron Wellington (30495), out of Maid of Lorne.—Col. Gunter, Wetherby, 150 gs.

Winsome 16th, roan, calved Aug. 10th, 1873; by Baron Oxford 4th (25580), out of Bright Eyes 5th.—Mr. G. Fox, Hertfield, 700 gs.

Melaby, white, calved September 4th, 1873; by Baron Oxford 4th (25570), out of Music.—Mr. G. Fox, 310 gs.

Blauche 13th, red and white, calved October 16th, 1873; by Duke of Oxford 24th (31002), out of Lady Blanche 3rd.—Sir J. Whitworth, 205 gs.

Winsome 17th, roan, calved Oct. 24th, 1873; by Duke of Oxford 24th (31002), out of Lady Bright Eyes 3rd.—Lord Skelmersdale, 310 gs.

Oxford Rose 9th, roan, calved Oct. 30th, 1873; by Duke of Oxford 24th (31002), out of Oxford Rose 5th.—Mr. Longman, 230 gs.

Baroness Oxford 3rd, red, calved Nov. 12th, 1873; by Duke of Hillhurst (28401), out of Baroness Oxford.—Mr. Holford, 1,100 gs.

Grand Duchess of Oxford 28th, white, calved Nov. 17th, 1873; by Duke of Oxford 24th (31002), out of Grand Duchess of Oxford 15th.—Mr. Ashburner, 675 gs.

Severn Maid, red, calved Feb. 8th, 1874; by Cleveland, out of Severn Girl.—Mr. Markworth, of New Zealand, 675 gs.

Clarissa (the property of Mr. Dewry), red and white, calved Feb. 20th, 1866; by Oxford (20450), out of Clarence.—Mr. Loder, 110 gs.

BULLS.

Baron Oxford 5th (27958), red, calved Feb. 7th, 1870; by 2nd Duke of Claro (21576), out of Lady Oxford 7th.—The Duke of Roxburgh, 250 gs.

Duke of Nancy (30991), red, calved Feb. 17th, 1872; by Cherry Duke (25752), out of Dorothy.—Mr. Dalzell, Cumberland, 46 gs.

Baron Winsome 3rd, roan, calved Dec. 4th, 1872; by Baron Oxford 4th (25580), out of Winsome.—Mr. Coleman, Stoke Park, 250 gs.

Baron Barrington 4th, white, calved Feb. 10th, 1873; by Baron Oxford 4th (25580), out of Countess of Barrington 4th.—Mr. W. H. Wakefield, Kendal, 210 gs.

Baron Barrington 5th, white, calved April 10th, 1873; by Baron Oxford 4th (25580), out of Countess of Barrington 5th.—Lord Skelmersdale, 300 gs.

Duke of Oxford 26th, roan, calved June 10th, 1873; by Baron Oxford 4th (25580), out of Grand Duchess of Oxford 19th.—Mr. Robinson, Beckhampstead, 420 gs.

Baron Tregunter, red, calved Sept. 30th, 1873; by 3rd Duke of Tregunter (31026), out of Evening Star.—Mr. Postlethwaite, 250 gs.

Baron Barrington 6th, white, calved Nov. 23rd, 1873; by Baron Oxford 4th (25580), out of Lady Ellen Barrington.—Mr. Howard, Winterfold, Worcestershire, 185 gs.

Duke of Oxford 28th, roan, calved December 24th, 1873; by the Duke of Oxford 24th (31002), out of Grand Duchess of Oxford 17th.—Lord Chesham, 550 gs.

Duke of Oxford 29th, roan, calved January 12th, 1874; by Baron Oxford 4th (25580), out of Grand Duchess of Oxford 12th.—Sir J. Whitworth, 400 gs.

Duke of Oxford 30th, red, calved February 1st, 1874; by Fifth Duke of Wetherby (31033), out of Grand Duchess of Oxford 21st.—Mr. Morris, Liverpool, 275 gs.

Baron Barrington 7th, white, calved April 22nd, 1874; by 3rd Duke of Clarence (23727), out of Countess of Barrington 5th.—Mr. Martin, Cornwall, 71 gs.

Baron Winsome 5th, roan, calved May 13th, 1874; by Duke of Nancy (30991), out of Winsome 12th.—Mr. Fawkes, Farley Hall, 71 gs.

Baron Winsome 6th, roan, calved May 20th, 1874; by Baron Oxford 4th (25580), out of Winsome 5th.—Mr. Crowlson, Ulverston, 50 gs.

SALE OF LORD BECTIVE'S SHORTHORNS.
AT UNDERLEY, KIRKBY LONSDALE, ON
SEPTEMBER 10.

BY MR. JOHN THORNTON.

"His Lordship has been a liberal and judicious buyer."—Thus was the sale introduced to a company far larger than that assembled at Holker. The morning was cloudy and often wet, as during the sale great gusts of wind accompanied with hail and drenching showers occasionally interrupted the business—a very different day to the one preceding. The catalogue of the Underley herd was accompanied by a map coloured with the different lines of railways and towns in the district. This made clear what otherwise would have been an obscure district to find, though the finding of it would repay the search when the beauties of the place were seen. A special train, happily arranged from Lancaster, picked up scores of passengers at Carnforth, Oxenholme and Low Gill; and although several conveyances were provided at Barbon, the nearest station to Underley, yet many had to walk, the numbers being so great.

The history of the stock was given in the preface to the catalogue, which stated that the herd was commenced in 1868, with purchases from the herd belonging to Mr. Foster, of Killhow. It was next increased by animals bought from Lord Peurhyn, Col. Kingscote; Mr. Rich, of Didmorton; Mr. McIntosh, of Havering Park; and Mr. Saunders, of Nunwick Hall. Subsequently several first-class animals were added from the Holker, Dunmore, and Gaddesby herds, and more recently the famous cow Tenth Duchess of Geneva, her heifer-calf, and the Ninth Duchess of Oneida, were purchased at the well-known sale at New York Mills, U.S.A. Baron Oxford 3rd (25579), bred at Holker, a son of that magnificent cow Lady Oxford 5th, was first used. He was succeeded by Grand Duke of Kent 2nd (28759), by Lord Oxford 2nd from Grand Duchess 9th, who is the sire of seventeen of the younger animals in the catalogue; while latterly Second Duke of Tregunter (26022), a son of Fourth Duke of Thorndale and Duchess 94th, for three seasons at Siddington, and Third Duke of Glo'ster from Gaddesby, also of the Duchess tribe, have been, and are still, in service. The animals whose pedigrees are herein given comprise the entire herd, with the exception of the Duchesses from America, a few favourite old cows, and Grand Duchess of Oxford 18th and Cherry Princess, whose daughters were both included in the sale. Eight lots are of the Kirklevington tribe, and eleven of the Gwynne or Princess family. Five are descended from the handsome Winsomes, of the Wild Eyes tribe, obtained from Holker; three are of the Barrington tribe, and seven of the popular Darlington family. Among the remainder are specimens of the Townsley Blanche, the Chaffs from Kingscote, the Craggs, and Violet tribes, while the old-established herds of Mr. A. L.

Maynard and Messrs. Crofton are represented by the Flora and Garland strains. The principal sires are bulls of the fashionable Duchess blood, more than two-thirds of the animals being by the well-known sires Seventh Duke of York (17754), Duke of Wetherby (17753), Third Duke of Wharfedale (21619), Third Duke of Clarence (23727), Fourth Duke of Thorndale (17750), Second Duke of Collingham (237304), Grand Duke 17th (24064), Grand Duke of Kent 2nd (28759), and Second Duke of Tregunter (26022). Three sons of the Duke of Devonshire's Lady Oxford 5th—Baron Oxford 3rd, 4th and 5th—are likewise among the sires, and it will be seen that the cows and heifers are nearly all in-calf either to Second Duke of Tregunter (26022), or Third Duke of Glo'ster (lot 43), the latter with Grand Duke of Kent 2nd (28759) being included in the sale.

As the cattle roamed in the park, it soon became manifest that the cows and heifers were quite equal to those offered at Holker. They were not so patchy, and although loosely made and large-framed—as their blood would naturally lead one to expect—they were perhaps altogether a better lot of cows, though not a more blooming lot of heifers. The bulls were by some considered not equal to those at Holker, by others superior. Be that as it may, the spirited sale, and capital prices got for them, were inferences greatly in their favour. The most conspicuous lots to attract the eye were 1, 3, 8, 10, 13, 15, 16, 18, 24, 25, 27, 29, 33, 34, 35, 36, 39. Perhaps for choice, old Duchess Gwynne, Siddingtons 4th and 7th, and the Darlington; among the heifers, Winsomedale, Cherry Queen and Empress of Oxford. Fair Maid of Kent and Princess Sale were beautiful little calves.

The reserved cows were viewed during the morning, and the company drawn together at lunch-time, by the parade of Tenth Duchess of Geneva, her yearling heifer, and her red bull-calf. The other American importation had injured a hind leg in the iron railings, and was unable to be led out. The cow is a magnificent animal, nicely proportioned, a lightish roan, with a grand back and ribs, good shoulders, somewhat hollow hind-quarters, but with a lovely head and beautiful pair of horns nicely set on. The heifer, although thick, handsome, and a beautiful roan, is not so highly finished as her dam, whose excellence is imparted to her son—a red calf, full of hair and masculine character, with great style and length of body, without being disjointed. Mr. Leuey's Sixth Duke of Oneida is out of the same dam, and her last calf promises to make equally as good a bull. The possession of these three Shorthorns is sufficient of itself to make a herd of great reputation; and the brilliant sale which followed undoubtedly stamps the Underley herd as one of the best Bates herds in the kingdom, if not the topmost one.

Luncheon was provided in a large marquee for 600, and not being ready by noon threw the sale a little late. Lord Bective presided, and Mr. Booth, of Warlahy, proposed his health. Mr. Sheldon, of Geneva, U.S.A., being present, his health was also given, and happily responded to, and by a quarter to two the company had gathered round the ring.

The biddings throughout were quick, general, and lively. Duchess Gwynne, rising 12 years old and down calving, created great excitement when she ran up to 430 gs. (Mr. Salt), and the spirit of the sale was of the same character. Mr. Coleman, who bid well at Holker, made several judicious purchases of cows, and took as a mate for them the Third Duke of Glo'ster, which Lord Bective bought at Gaddesby last year, Mr. Cheney's agent being against Mr. Coleman on this occasion. Mr. Wilson, of Shotley, purchased Violante's Butterfly, bred at Towneley, of the Blanche tribe, as well as one of the best Winsomes. Lord Ellesmere secured some of the Siddingtons. The Darlington, the tribe most fancied by the public—large,

massive animals as they are—were all purchased by Mr. Loder; and Col. Loyd-Lindsay took the Chaff family. Lord Fitzhardinge bid very firmly both for Siddington 7th—now swollen into a fine cow—and Winsomedale, securing both of them. Mr. Brogden, having the Princess tribe, still kept to it. Great excitement took place when Cherry Queen entered; as she had been exhibited and admired, though not placed at Hall. From 500 gs. to 700 gs., and on to a thousand, were rapid bids, Mr. Larking and Mr. Holford concluding the joust, and Sussex won at 1,220 gs. A handsome Winsome calf accompanies her. The calves came galloping into the ring; they made excellent prices, as also the bulls. Grand Duke of Kent 2nd, returned from hire, looked thin; but the handsome calves he had left on the herd added much to his fame. Mr. De Vitre takes him at 750 gs. into Berkshire, where he has a fine herd of Bates and Towney cattle. This bull, bred by Mr. Leuey, was sold to Mr. Slye, from whom Lord Beetive purchased him for 1,000 gs. Lord Lunsdale Bates was a promising young bull, and Mr. Casswell bid strongly and last for him against Mr. Longman, and he goes into Lincolnshire. Major Webb bought Marquis, a very handsome calf, at 330 gs., and Ostrogoth, a young bull bred from Turks Darling a reserved cow, of the old Sarsden blood, made the same figure, Mr. Percival Maxwell competing for both of them. A few bulls, the property of Mr. Fawcett, of Scaleby, and his tenants, were afterwards sold at lower figures. Considering the number sold, 55 head, 15 of which were bulls, the average of £363 is nearly twice as much as was generally anticipated, and the sum realised is the largest yet made by any herd of Shorthorns in England. Subjoined are prices and buyers.

COWS AND HEIFERS.

- Duchess Gwynne, roan, calved December 15, 1862; by Duke of Wetherby (17753), out of Polly Gwynne.—Mr. Salt, Leicester, 430 guineas.
- Violante's Butterfly, red and white, calved November 17, 1862; by Royal Butterfly (16862), out of Violante.—Mr. T. Wilson, Shotley Hall, 220 gs.
- Kirklevington 16th, roan, calved January 6, 1865; by Duke of Wetherby (17733), out of Kirklevington 12th.—Sir John Swinburne, 420 gs.
- Flora Melvor, red, calved January 6, 1864; by Third Duke of Lancaster (19624), out of Fata Morgana.—Mr. E. J. Coleman, Stoke Park, 150 gs.
- Winsome 2nd, red and white, calved March 12, 1865; by Lord Oxford (20214), out of Winsome.—Mr. E. J. Coleman, 305 gs.
- Lady Oxford, roan, calved September 12, 1865; by Lord Chancellor (20160), out of Lady Richmond.—Mr. E. J. Coleman, 100 gs.
- Oxford Belle, roan, calved October 21, 1866; by Thirteenth Duke of Oxford (21604), out of Oxford Witch.—Mr. J. Robinson, Birkhamstead, 60 gs.
- Siddington 4th, roan, calved March 14, 1867; by Seventh Duke of York (17754), out of Siddington 2nd.—Lord Ellesmere, 600 gs.
- Carolina 7th, red, calved October 8, 1867; by Grand Duke 13th (21859), out of Carolina 5th.—Mr. E. J. Coleman, 170 gs.
- Darlington 17th, red and white, calved January 29, 1868; by Eleventh Grand Duke (21849), out of Darlington 13th.—Mr. R. Loder, Whittfebury, 500 gs.
- Chaff 13th, roan, calved February 8, 1868; by Second Earl of Walton (19672), out of Clarissa.—Col. Loyd Lindsay, 270 gs.
- Generil 4th, roan, calved August 3, 1868; by Third Duke of Clarence (25727), out of Generil.—Not offered.
- Siddington 7th, roan, calved October 9, 1868; by Seventh Duke of York (17754), out of Siddington 3rd.—Lord Fitzhardinge, 750 gs.
- Fair Maid of Collingham, roan, calved April 22, 1869; by Second Duke of Collingham (23730), out of Fair Maid of York.—Mr. A. Brogden, M.P., 300 gs.
- Lady Cambridge, roan, calved June 20, 1869, by Royal Cambridge (25009), out of Lady Oxford.—Sir Wilfred Lawson, Bart., 180 gs.
- Darlington 19th, roan, calved August 12, 1869; by Third Duke of Wharfedale (21619), out of Darlington 15th.—Mr. R. Loder, 650 gs.
- Princess 4th, white, calved September 27, 1869; by Baron Oxford 3rd (25579), out of Princess 3rd.—Mr. A. Brogden, M.P., 300 gs.
- Winsome 9th, red, calved December 17, 1869; by Grand Duke 17th (24964), out of Winsome 2nd.—Mr. T. Wilson, Shotley, 595 gs.
- Marchioness 3rd, roan, calved July 21, 1870; by Second Duke of Collingham (23730), out of Siddington 1st.—Lord Ellesmere, 600 gs.
- Deutsdale, red, calved September 14, 1870; by Second Duke of Collingham (23730), out of Darlington 15th.—Mr. R. Loder, 550 gs.
- Lady Laura Barrington, white, calved November 11, 1870; by Baron Oxford 4th (25580), out of Lady Ellen Barrington.—Duke of Devonshire, 305 gs.
- Barbon Belle, red and white, calved August 8, 1871; by Baron Oxford 3rd (25579), out of Oxford Belle.—Not offered.
- Baroness Bradwardine, roan, calved December 29, 1871; by Baron Oxford 3rd (25579), out of Flora Melvor.—Mr. J. Grant Morris, Liverpool, 165 gs.
- Duchess Gwynne 4th, roan, calved March 6th, 1872; by Baron Oxford 5th (27958), out of Duchess Gwynne 2nd.—Mr. R. Loder, 550 gs.
- Winsomedale, roan, calved March 12, 1872; by Baron Oxford 4th (25580), out of Winsome 2nd.—Lord Fitzhardinge, 650 gs.
- Princess Gwynne 2nd, roan, calved May 6, 1872; by Royal Cambridge (25009), out of Duchess Gwynne.—Rev. P. Graham, Lancashire, 250 gs.
- Cherry Queen, roan, calved October 2, 1872; by Baron Oxford 5th (27958), out of Cherry Princess.—Mr. J. W. Larkin, Ashdown, Sussex, 1,220 gs.
- Duchess Gwynne 5th, white, calved February 17th, 1873; by Grand Duke of Kent 2nd (28759), out of Duchess Gwynne 2nd.—Mr. T. Holford, Market Harborough.
- Empress of Oxford, white, calved February 26, 1873; by Grand Duke of Kent 2nd (28759), out of Grand Duchess of Oxford 18th.—Mr. T. Holford, 770 gs.
- Deepdale, roan, calved March 2, 1873; by Second Duke of Tregunter (26022), out of Darlington 17th.—Mr. G. Fox, Cheshire, 315 gs.
- Oxford Lily, white, roan ears, calved February 27, 1873; by Grand Duke of Kent 2nd (28759), out of Lady Oxford.—Mr. J. Postlethwaite, Whitehaven, 130 gs.
- Clotilde, roan, calved March 12, 1873; by Grand Duke of Kent 2nd (28759), out of Chaff 13th.—Col. Loyd Lindsay, 250 gs.
- Underley Darling 2nd, roan, calved August 29, 1873; by Grand Duke of Kent 2nd (28759), out of Underley Darling.—Mr. J. Postlethwaite, Whitehaven, 200 gs.
- Deutsdale 2nd, roan, calved July 21, 1873; by Grand Duke of Kent 2nd (28759), out of Deutsdale.—Lord Penrhyn, 420 gs.
- Princess 6th, roan, calved August 29, 1873; by Grand Duke of Kent 2nd (28759), out of Princess 5th.—Marquis of Headfort, Ireland, 450 gs.
- Fair Maid of Kent, roan, calved December 21, 1873; by Grand Duke of Kent 2nd (28759), out of Fair Maid of Collingham.—Marquis of Headfort, 275 gs.
- Lady Kendal, roan, calved March 7, 1874; by Grand Duke of Kent 2nd (28759), out of Lady Oxford.—Mr. J. Robinson, Birkhamstead, 140 gs.
- Lily Beckfoot, white, calved May 3, 1874; by Grand Duke of Kent 2nd (28759), out of Oxford Belle.—Mr. A. Staveley Hill, M.P., 40 gs.
- Princess Sale, red, calved May 23, 1874; by Second Duke of Tregunter (26022), out of Lady Sale of Putney.—Sir John Swinburn, 370 gs.
- Winsomedale 2nd, roan, calved June 4, 1874; by Second Duke of Tregunter (26022), out of Winsome 9th.—Mr. J. W. Larkin, 330 gs.
- Princess 7th, roan, calved July 10, 1874; by Second Duke of Tregunter (26022), out of Princess 4th.—Mr. W. H. Salt, 265 gs.

Castalia, white, calved July 18, 1874; by Second Duke of Tregunter (26022), out of Chaff 13th.—Col. Loyd Lindsay, 70 gs.

BULLS.

Third Duke of Gloster, red, calved December 1, 1872; by Tenth Duke of Thorndale (23453), out of Duchess of Airdrie 8th.—Mr. E. J. Coleman, 900 gs.

Grand Duke of Kent 2nd (28759), white, roan ears, calved May 12, 1870; by Lord Oxford 2nd (20215), out of Grand Duchess 9th.—Mr. H. D. de Vitre, Berkshire, 750 gs.

Marquis 3rd (31826), roan, calved July 13, 1871; by Second Duke of Collingham (23730), out of Siddington 7th.—Capt. Gandy, 175 gs.

Duke of Dentsdale 2nd, red and white, calved March 17 1873; by Second Duke of Tregunter (26022), out of Darlington 19th.—Mr. W. Hutchinson, Penrith, 125 gs.

Duke of Kirklevington, roan, calved March 24, 1873; by Second Duke of Tregunter (26022), out of Kirklevington 16th.—Sir Richard Musgrave, 305 gs.

Lord Lunsdale Bates, red, calved March 26, 1873; by Baron Oxford 5th (27958), out of Lady Tndale Bates 2nd.—Mr. J. H. Caswell, Lincolnshire, 510 gs.

Amadeus, white, calved July 14, 1873; by Grand Duke of Kent 2nd (28759), out of Princess 4th.—Mr. A. Dalzell, Workington, 61 gs.

Duke of Tosca, roan, calved October 23, 1873; by Grand Duke of Kent 2nd (28759), out of Duchess Gwynne.—Mr. M. Kennedy, Ulverstone, 300 gs.

Marquis 4th, white, calved November 23, 1873; by Grand Duke of Kent 2nd (28759), out of Siddington 6th.—Mr. Williamson, Cheshire, 220 gs.

Marquis 6th, roan, calved December 16, 1873; by Grand Duke of Kent 2nd (28759), out of Marchioness 2nd.—Major Webb, Tamworth, 330 gs.

Ostrogoth, roan, calved December 24, 1873; by Grand Duke of Kent 2nd (28759), out of Turk's Darling.—Messrs. S. and J. Lindow, Park House, Whitehaven, 330 gs.

Lord of Garsdale, white, calved January 21, 1874; by Grand Duke of Kent 2nd (28759), out of Duchess Gwynne 2nd.—Mr. W. H. Wakefield, Sedgwick, 115 gs.

Visigoth, roan, calved April 25, 1874; by Grand Duke of Kent 2nd (28759), out of Winsome 2nd.—Mr. E. W. Lowe, Tipperary, 120 gs.

Duke of Dentsdale 3rd, roan, calved May 5, 1874; by 2nd Duke of Tregunter (26022), out of Darlington 19th.—Marquis of Headfort, 110 gs.

Lawrence Barrington, roan, calved July 11, 1874; by 2nd Duke of Tregunter (26022), out of Lady Laura Barton.—Mr. C. A. Barnes, Hertfordshire, 100 gs.

SUMMARY.

40 cows averaged	£382 11 10	£15,303 15 0
15 bulls	„ 311 11 5	4,673 11 0
55 head	„ 363 4 6	£19,977 6 0

The following first-class bulls were sold by permission of Lord Beattie, after the dispersion of the Underley herd:

Royal Cambridge Gwynne (29849) (Mr. Wilson's), rich roan, calved November 22, 1868; by Royal Cambridge (25009), out of Duchess Gwynne.—Mr. Becton, 40 gs.

Charmer Duke Echter 3rd (Mr. Fawcett's), white, calved January 1, 1874; by Eighth Duke of York (28480), out of Constancy.—Mr. Marshall, 41 gs.

Lord Spencer (Mr. Fawcett's), rich roan, calved December 4, 1873; by Eighth Duke of York (28480), out of Oxford's Juliana.—Mr T. C. Thompson, Kirkhouse, Brampton, 52 gs.

THE LATE MR. GIBBON'S HERD.

This sale took place at Holmescales, between Kirby Lonsdale and Oxenholme, in consequence of the early and sudden death of Mr. H. J. Gibbon. The larger portion of the herd was sold last year at Storr's, and now it only numbered 15 head, consisting mostly of cows and calves, and two old bulls of Booth blood. The cattle had run out with their calves and were wholly unprepared for sale; moreover a steady downpour all day long detracted from their appearance.

There were four lots descended from the Aylesby herd, and these were most in request. Golden Star, a plain red and white, but a well formed sweet-looking cow, had bred an extraordinarily good red bull-calf, and Mr. Waldo, of Kent, bought the cow at 180 gs., and Mr. Miller, of Singleton, the calf at 105 gs. It is not at all improbable he may be seen at the Royal next year. The Rev. J. Micklethwaite bought both the other ten heifers at 135 gs. and 100 gs. respectively. Earl of Clare, a Mantalini bull in use, was plain in colour and small in stature; Mr. Beattie bought him at 56 gs., and Prince of Imperial (32142) of the Bliss tribe, a large roan, broad horned bull, somewhat deficient in his fore-quarters, goes to Mr. H. Fawcett, of Leeds, at 110 gs. A set of Coates' Herd-book brought 21 gs., and the Royal Society's Journal 20 gs., well-bound. Thus the "great Shorthorn drama" was concluded in three acts, after what in London phrase may be called a brilliant and successful performance to crowded houses, and it is likely that the Shorthorns will still continue to hold the public estimation for many years to come. One noticeable feature in all the sales was that the best beast made the most money.

SALE OF MR. RICHARDSON'S SHORTHORNS.

BY MR. THORNTON.

For thirty years and more Mr. J. M. Richardson has kept a few Shorthorns round about the green pastures at Hutton. Within a short distance is Netherscales, Blencow, Skelton, and other places, well known for good blood, and Mr. Unthank was the means of inducing Mr. Richardson to keep a good beast as he has many other breeders. He started him with the Diamonds, a short pedigree tribe, originating with a good Darlington cow, on which Gainford (2044), one of the best and most favourite sires that ever came into the district, was put. Thalberg, one of Mr. Troutbeck's Gwynne bulls, was mated with the produce, and begot a heifer which, in her turn, brought forth Dewdrop to Captain Shaftoe. Mr. Unthank bred a heifer from the sort which beat everything around, even the Lowther cattle. By his bull Lofty, Diamond was begotten from Dewdrop, and there were several of the tribe in the herd which, although small, yet contained many useful animals. The most favourite trite was the Gwynne, of which there were three females. The Pearls, of Crofton blood, but well-known at Nunwick, had many representatives and several good animals. With two or three odd lots the catalogue was completed. When Mr. Richardson first started breeding, he was a great feeder and exhibitor; but in time he gave up showing, and went more in for milk and lower keeping. The Pearls were quite after his heart in this matter—neat, well-formed, handsome, stylish cattle: they did their duty at the pail by giving 20 to 25 quarts daily. They were no great flesh carriers, yet some of them were capital cows. Lot 2, Pearl 9th, thin and well-shaped, was kept in the county by Mr. J. C. Bowstead at 55 gs.; but the next lot, Pearl 10th, made a guinea more, and goes to Mr. Tisdall, at Holland Park, Kensington. One of the best lots, Pearl 12th was brought in with a large bull-calf beside her. After some good bidding from the Rev. O. James, Mr. Brunton secured her at 78 gs. for Kelso. He also purchased what may be considered the best lot in the sale. This was Riot, a roan two-year-old heifer, down calving. She had a grand top and ribs, but stood a little close on her legs, and was plain about the head. Still Sir Richard Musgrave had a great fancy for her, and bid 100 gs., but Mr. Brunton took her across the Border too

at 105 gs. Mr. Gow got a handsome Pearl calf, lot 17, at 44 gs., and two or three others to go to Northumberland. Princess Gwynne, lot 5, a large-framed handsome roau cow, came through Mr. Caddy's stock, which he got at Blencow in 1839. Having lost two quarters, and being recently served, she was not everybody's money. She had bred two calves. Mr. Smith, however, gave 100 gs. for her, and 72 gs. for her calf, to join the Storr's herd. The calf was a handsome roau by Mr. Toppin's Knight of Killerby. Mr. Toppin bid well for the calf, having purchased her elder sister, Agnes Gwynne, very cheap at 51 gs. Sir R. Musgrave bought Diamond 5th, a good red heifer, by Mr. Lamb's prize bull Iguoramus, at 41 gs., and Mr. Lamb gave the same price for Diamond 4th, by Mr. Saunders' Waterloo Boy. Lot 4, Patchouli 5th, a stylish true-made cow, bred by Mr. Christy in Essex, was purchased by Mr. Unthank for 60 gs., after competition with Mr. Heskett; her calf, a young bull, went for 21 gs., but there is little demand for bull-calves in that season of the year and in that part of the country. A few dairy cows went cheap. The sale throughout was slow, yet it averaged well, the seventeen cows and heifers making 55 gs. each, and the seven bull-calves £25. Sir Henry Vane presided at the lunch, where a goodly company assembled to congratulate Mr. Richardson on his restoration to health after a long and serious illness, and which was the cause of the sale. A few drizzly showers fell, and soon after the sale was concluded it became a down pour—little needed, as harvest is still out, and the fields are as fresh and as green as at May-day.

COWS AND HEIFERS.

Diamond 2nd, roau, calved March 20, 1867, by British Cherry (23461), out by Diana by Baron of Ravensworth (17380).—Mr. J. Fenton, 37 gs.
 Pearl 9th, roau, calved February 16, 1868, by British Cherry (23461), out of Pearl 6th by Welcome Guest (15497).—Mr. J. C. Bowstead, 55 gs.
 Pearl 10th, red, calved May 11, 1868, by British Cherry (23461), out by Pearl 7th by Lablache 2nd (20092).—Mr. E. C. Tisdall, 56 gs.
 Patchouli 5th, red, calved April 6, 1869, by Mandarin (26799), out of Patchouli 4th by Duke of Grafton (21594).—Mr. J. Unthank, 60 gs.
 Princess Gwynne, roau, calved November 17, 1869, by Knight of Santon (24275), out of Dainty Gwynne by Sir Windsor (22927).—Rev. T. Staniforth, 100 gs.
 Primrose, roau, calved March 25, 1870, by Kirbythore Waterloo (24263), out of Red Rose 4th by Royal Oxford (22795).—Sir R. C. Musgrave, 40 gs.
 Red and white cow-calf.—Mr. T. Gow, 11 gs.
 Diamond 3rd, red, calved October 25, 1870, by Ingleswood (28892), out of Diamond 2nd by British Cherry (23461).—Mr. D. Bragg, 36 gs.
 Waterloo 29th, red and white, calved November 30, 1870, by Grand Duke of Lightburne 2nd (26291), out of Waterloo 26th by Ravenspur (20628).—Mr. R. Jefferson, 45 gs.
 Pearl 12th, red, calved March 18, 1871, by Lord of Nunwick (26702), out of Pearl 9th by British Cherry (23461).—Mr. J. Brunton, 78 gs.
 Pearl 13th, red, calved August 30, 1871, by Lord Bates (29065), out of Pearl 10th by British Cherry (23461).—Rev. O. James, 46 gs.
 Riot, roau, calved December 27, 1871, by Rosolio (32346), out of Reckless by Mandarin (26799).—Mr. J. Brunton, 105 gs.
 Diamond 4th, red, calved March 30, 1872, by Waterloo Boy (27762), Diamond 2nd by British Cherry (23461).—Mr. J. Lamb, 41 gs.
 Agnes Gwynne, roau, calved November 9, 1872, by Lord Bates (29064), out of Princess Gwynne by Knight of Santon (24275).—Mr. J. C. Toppin, 51 gs.
 Diamond 5th, red, calved March 10, 1873, by Ignoramus (28837), out of Diamond 2nd by British Cherry (23461).—Sir R. C. Musgrave, 41 gs.

Polly Gwynne, roau, calved January 9, 1874, by Knight of Killerby (29000), out of Princess Gwynne by Knight of Santon (24275).—Rev. T. Staniforth, 72 gs.
 Diamond 6th, red and white, calved April 10, 1874, by Stackhouse (32591), out of Diamond 2nd by British Cherry (23461).—Mr. T. Gow, 13 gs.
 Pearl 14th, red, calved August 1, 1874, by Knight of Killerby (29000), out of Pearl 10th by British Cherry (23461).—Mr. T. Gow, 44 gs.
 Strawberry, roau dairy cow.—Rev. O. James, 20 gs.
 White Rose, white dairy cow, three years old.—Mr. R. Thomson, 14 gs.
 Tulip, roau dairy cow, three years old.—Mr. Robinson, 17 gs.
 White heifer, calved in 1873.—Mr. B. Sweeton, 15 gs.
 Ruby, roau heifer, calved in March, 1873.—Mr. Robison, 18 gs.
 White Rose 2nd, white, calved May 2, 1874.—Mr. T. Gow, 5½ gs.

BULLS.

Lilywhite, white, calved April 8, 1873, by Lord Bates (29065), out of Pearl 9th by British Cherry (23461).—Mr. J. Bainbridge, 26 gs.
 Familiar Pearl, roau, calved January 5, 1874, by Marquis of Lorne (31847), out of Pearl 12th by Lord of Nunwick (26702).—Mr. H. Walker, 35 gs.
 Duke of Edinburgh, red and a little white, calved January 20, 1874, by Knight of Killerby (29000), out of Diamond 3rd by Ingleswood (28892).—Mr. Bleasdale, 20 gs.
 Killerby Pearl, red roau, calved March 23, 1874, by Knight of Killerby (29000), out of Pearl 9th by British Cherry (23461).—Sir H. R. Vane, Bart., 20 gs.
 The Doctor, red, calved April 18, 1874, by Waterloo Boy (27762) out of Waterloo 29th by Grand Duke Lightburne 2nd (26291).—Mr. A. Graham, 30 gs.
 Romulus, red and white, calved May 25, 1874, by Stackhouse (32591), out of Pearl 13th by Lord Bates (29065).—Mr. J. Jardine, 15 gs.
 Comet, roau, calved July 14, 1874, by Bloomfield, out of Patchouli 5th, by Mandarin (26799).—Mr. Wm. Graham, 21 gs.

SALE OF MR. CHEYNEY'S SHORT-HORNS.

AT GADDESBY, LEICESTER, ON SEPTEMBER 23RD.
 BY MR. H. STRAFFORD.

That "he had found a district housed in brick and left it under stone" was once thought a boast which did credit to an emperor, but it may be doubted if some visitors to Leicestershire, in September 1874, would consider such a change would invariably prove to be a gain. For no stone that ever was quarried could give the warmth to the landscape in Gaddesby Park which is afforded by the bricks of which the hall is built. No tint could come out better on a bright day, in early autumn—when the sun has lost power, but scarcely brilliancy—than does the yellow-red of the mausion in contrast with the hoary church adjacent and the dark-green of the elms and the herbage in the park. The country between this and Melton Mowbray—noted for horse-flesh living and for swine-flesh dead—would scarcely be improved did Baron Haussman get a commission to reconstruct the dwellings à la Parisian Boulevards. But the master of Gaddesby has thought if the local building material cannot be improved on the local Shorthorns may; for into a tract of the richest grazing land, famous for fatted heaves for ages,

he has imported the most fashionable strains of blood which are at present to be found in the States. Other breeders have done the like, no doubt; but the attendants at English Shorthorn sales have not encountered before the produce of the late consignment of "Princess" animals from America. A heifer-calf from "Lady Sale of Putney" was, indeed, sold at Underley the other day; but she was hardly old enough to show the character developed beyond the Atlantic, by descendants of exported specimens of a tribe which, on this side, has always been deservedly esteemed. Many visitors were curious to see these Princess cattle, especially as English-bred Princesses were to be sold at the same time and place, and so an excellent opportunity would be afforded for comparison. Accordingly a large company assembled on the twenty-third, day and locality both being favourable, yet certain magnates (among the Bates courtiers) were *conspicuously* away. Every care had been taken to set the lots off to advantage, and to arrange the sale so as to secure a high average, and the result must have been beyond expectation. Before men have ceased to talk—like Uncle Toby's scullion with foolish fat face of praise—about Holker and Underley price, these are as much exceeded (so far as females go) as they themselves surpassed every previous auction of a Shorthorn herd. It is not our intention to enlarge on this fact, but it must needs be chronicled. In 1873 Mr. Cheney sold 35 animals for £10,307 17s. In 1874 19 females (mostly calves) make £10,720 10s., or an average of £564 4s. 9d. for the whole lot offered. It is best to let the facts speak for themselves, and make no comment. As we have intimated, "every card turned up a trump." Weather, fashion, state of the money market, all were "as could be wished." And the crowded tables at the luncheon assured one that a sufficient regiment of customers were present to buy up not merely the lots offered, but the reserved herd as well. These were in the park, but in the remotest part of it, so that our inspection was confined to the sale cattle and the old imported bull. Many have criticised 9th Duke of Geneva. It must be conceded now that—such is the present feeling among wealthy Shorthorn buyers—no bull's stock ever were sold at such a high figure. Yet the contrast between the prices made by the bulls, as compared with the heifers, is a fact, as well as the high average of these, as is also the curious confinement of the list of buyers within the limit of that of previous competitors for similar animals. Mr. A. H. Longman, we believe, bid high for one of the Duchess lots; but, as a rule, there were few new bidders, and not one new buyer. There were two of the animals offered whose portraits appear in the last volume of the Herd-Book—Eighth Duchess of Airdrie and Kirklevington 18th. The former was substituted at the last minute for her daughter, who had calved, and been unlucky. It must be said that this Eighth Duchess—who is reported to have cost 10,000 dollars "on the other side of the water"—was a fine slashing, if somewhat leggy, cow, heavy in calf; as was also Kirklevington 18th, who—except the characteristic "nipping-in" behind the shoulders, and this by no means to a great extent—was a heavy, good cow, on very short legs. When 8th Duchess came into the sale-ring, which was soon after two o'clock, the chairman at the luncheon, Mr. Cheney himself, having wisely curtailed the lists of toasts—no healths were drunk save that of the Royal family and his own—the cow provoked a good deal of admiration, but no very eager bidding. She was, however, put up at 1,000 gs., and rose slowly till the price given below was reached, and she goes to take the place, at Havering, vacated by Grand Duchess 21st. Lady Waterloo 22nd, with her calf (lot 19), came next into the ring, and the bidding, begun by Mr. Bowley at 100 gs., rose slowly to 225 gs., at which, if fashion holds,

she should not be dear. Peach Blossom 8th, the only white female shown, began at an offer of 50 gs., but made her value, even taking into account her being stunted to the 14th Duke of Geneva. When the next lot—the first of the daughters of the old Princess cow, for which Mr. Adkins gave Mr. Stephenson 100 gs., and sold her, after having had four calves, to Mr. Cheney for thrice as much—Princess of Geneva, came into the ring the sale became very lively, and she ran up from 200 to 800 gs. without much effort from the auctioneer. Mr. McIntosh got her, with an in-calf to her own sire, for 860 gs., and yet she was not the dearest lot sold. Her own sister was equally in request. They were two nice heifers, if somewhat dark in their roan hue. Cleopatra's Duchess coming, like the meat in a sandwich, between the two, was not without admirers; nor was Seraphina's Duchess (lot 7), who goes, as her companion, to Stancliffe Hall. Then came a red and white Oxford heifer, whose appearance acted like a wet blanket on the bidders, and she was dragged up to 200 gs., then went briskly to 310 gs. by an old admirer of the tribe. The next lot, Duchess of Gloucester, a charming red yearling, revived the sale, and, beginning, like the elder Duchess, at 1,000 gs., went up steadily to 1,700 gs., when the pace slackened. At 1,750 gs. she was knocked down, and Sir Curtis Lampton's name given as buyer; but a little demur caused her to be put up again, and she finally made 1,785 gs. to the same purchaser. Lady Elizabeth, first of the Princesses, shared the fate of those who enter next—"a well-graced actor having quitted the stage"—for she was coldly received, and waited for an opening bid of 200 gs. for some minutes. She was leggy and of a plain colour, yet her dam was a good cow with a fine bag, and her own brother about the best of the bull calves. Lady Waterloo 28th was a very good heifer, of a capital red; and Seraphina's Duchess 2nd, a not much inferior roan; nor was Wild Duchess of Geneva 3rd, the lot following these, far behind. After seeing three such calves by one sire, it is impossible to withhold from him the credit of having "that within which passeth show," for these assuredly have the grace of beauty, which he lacks. Rosalie—lot 14, got by an American Princess bull from an ex-American Princess cow—kept the ball a-rolling, and made 700 gs. readily; and after her the interest taken in the lots perceptibly diminished, as Mr. Stratford's labour increased. From this time the sale was slow, the biddings coming tardily from a limited number of competitors, till with the first bull the spirit of the thing evaporated. The bulls were sold indeed, but they took some selling, and any person conversant with the strains they represented will compare with surprise the prices made for bull-calves here and at Underley for similar animals. It cannot be said that the calves had been badly done by; animals more plainly speaking of good and liberal usage never entered a ring, and they were gay-coloured, well-haired, stylish calves of their type. Mr. Pavin Davies' four Kirklevington cows were good specimens, and made good prices, though possibly the Bates men will not allow this; but over the sale of the extra bulls it is best "to draw a veil" and retire: they did not do the blood credit, and did not get the credit their appearance deserved. Lord Garland was a nice bull, but the company had begun to disperse, for the hour for starting the "special" from Brooksby was at hand. Altogether it was a remarkable and a suggestive sale, both for what was done and what was not.

Eighth Duchess of Airdrie, calved July 10th, 1867, by Royal Oxford, out of Duchess of Airdrie 7th.—Mr. Mackintosh, 1,700 gs.

Lady Waterloo 22nd, calved January 10th, 1871, by 7th Duke of York, out of Lady Waterloo 15th.—Mr. G. Fox, 225 gs.

Peach Blossom 8th, calved June 25th, 1871, by 8th Duke of York, out of Peach Blossom 6th.—Colonel Kingscote, 185 gs.
 Princess of Geneva, calved August 3rd, 1871, by 9th Duke of Geneva, out of Princess.—Mr. Mackintosh, 860 gs.
 Cleopatra's Duchess 2nd, calved June 18th, 1872, by 9th Duke of Geneva, out of Cleopatra 12th.—Sir J. Whitworth 300 gs.
 Princess of Geneva 2nd, calved October 15th, 1872, by 9th Duke of Geneva, out of Princess.—Mr. H. J. Sheldon, 800 gs.
 Seraphina's Duchess, calved November 16th, 1872, by 9th Duke of Geneva, out of Seraphina 22nd.—Sir J. Whitworth, 160 gs.
 Lady Oxford 15th, calved May 1st, 1873, by 9th Duke of Geneva, out of 13th Lady of Oxford.—Mr. P. Davies, 310 gs.
 Duchess of Gloucester, calved July 10th, 1873, by 9th Duke of Geneva, out of 14th Duchess of Airdre.—Sir Curtis Lamson, 1,785 gs.
 Lady Elizabeth, calved July 13th, 1873, by 9th Duke of Geneva, out of Primula.—Mr. Lenev, 430 gs.
 Lady Waterloo 28th, calved August 30th, 1873, by 9th Duke of Geneva, out of Lady Waterloo 19th.—Mr. G. Fox, 530 gs.
 Seraphina's Duchess 2nd, calved December 8th, 1873, by 9th Duke of Geneva, out of Seraphina 22nd.—Lord Penrhyn, 200 gs.
 Wild Duchess of Geneva 3rd, calved December 26th, 1873, by 9th Duke of Geneva, out of Wild Oxford.—Mr. Gow, 555 gs.
 Rosalie, calved February 23rd, 1874, by Saladin, out of Rosette.—Mr. G. Fox, 700 gs.
 Fantail's Duchess 2nd, calved February 28th, 1874, by 9th Duke of Geneva, out of Fantail.—Mr. J. Lynn, 135 gs.
 Lady Wellesley, calved May 16, 1874, by 9th Duke of Geneva, out of Lady Wellington.—Mr. P. Davies, 360 gs.
 Geneva's Minstrel 2nd, calved May 20th, 1874, by 9th Duke of Geneva, out of Minstrel 3rd.—Mr. W. H. Salt, 260 gs.
 Lady of Oxford 16th, calved June 28th, 1874, by 9th Duke of Geneva, out of 13th Lady of Oxford.—Mr. John Thornton, 605 gs.
 Lady Waterloo 29th, calved August 26th, 1874, by 9th Duke of Geneva, out of Lady Waterloo 22nd.—Mr. Gow, 110 gs.

BULLS.

Master Faithful, calved July 12, 1873, by Credit, out of Fidelity 2nd.—Mr. Beauford, Liverpool, 50 gs.
 Duke of Goscote 2nd, calved November 23rd, 1873, by 9th Duke of Geneva, out of Darlington 12th.—Mr. H. H. Langham, Cottesbrooke-grange, 60 gs.
 Earl of Leicester 3rd, calved December 16th, 1873, by Royal Cambridge 2nd, out of Princess of Geneva.—Mr. Cotterill Dormer, 90 gs.
 Earl of Leicester 4th, calved March 20th, 1874, by 9th Duke of Geneva, out of Lady Susan 3rd.—Mr. Thomas, 120 gs.
 Earl of Leicester 5th, calved March 21st, 1874, by 9th Duke of Geneva, out of Princess.—Mr. C. Howard, 68 gs.
 Earl of Leicester 6th, calved April 15th, 1874, by Saladin, out of Rose Ann.—Mr. Smith, Leicester, 73 gs.
 Lord Blanche, calved May 20th, 1874, by 9th Duke of Geneva, out of Lady Blanche.—Mr. F. Minton, Stoke, near Grantham, 45 gs.
 Earl of Leicester 7th, calved July 12th, 1874, by 9th Duke of Geneva, out of Primula.—Mr. F. Sartoris, 60 gs.

SALE OF SUFFOLK HORSES AND OTHER STOCK AT COVEHITHE.

There were seventy-five head of horse stock, including six young chesnut cart stallions, two of which are winners at the various local and other agricultural shows; forty-two brood mares and geldings, and twenty-two cart colts, fillies and foals, and four hunters and harness horses. In addition to the horse stock there were 1,180 blackfaced ewes and half-bred lambs, eighty-four Short-horn beasts, and eight Shorthorn cows, besides all the implements. The sale took place under the direction of the executors of the late Mr. S. C. Goodwyn. For Mr. Goodwyn's horses the prices were :

1. Fancy, a cart mare, sold to Mr. Beakbane, Liverpool, for 97½ gs.
2. Smart, to Mr. Havers, for 67½ gs.
3. Scot, to Mr. Havers, 62½ gs.
4. Diamond, to Mr. Woods, 55 gs.
5. Tinker, a gelding.—Mr. Pratt, 55 gs.
6. Farmer.—Mr. Chaplin, 72½ gs.
7. Captain.—Earl Dudley, 60 gs.
8. Ramper.—Earl Dudley, 85 gs.
9. Spright, a cart mare.—Mr. Beakbane, 125 gs.
10. Mogy, a cart mare.—Mr. Beakbane, 115 gs.
11. Briton.—Mr. A. Garrett, 80 gs.
12. Darby.—Earl Dudley, 80 gs.
13. Smart, a Suffolk mare.—Mr. Pratt, 52½ gs.
14. Lively.—Earl Dudley, 105 gs.
15. Brag.—Mr. Brown, 52½ gs.
16. Boxer, a gelding.—Mr. Pearce, 40 gs.
17. Briton.—Earl Dudley, 60 gs.
18. Captain.—Mr. Seace, 65 gs.
19. Proctor.—Messrs. Lucas Brothers, London, 65 gs.
20. Sharper.—Messrs. Lucas Brothers, 60 gs.
21. Bumper.—Messrs. Lucas Brothers, 87½ gs.
22. Mogy.—Messrs. Lucas Brothers, 72½ gs.
23. Darby.—Earl Dudley, 92½ gs.
24. Bly.—Mr. Grimwade, 52½ gs.
25. Ramper.—Mr. Pratt, 62½ gs.
26. Captain.—Mr. Kirby, 34 gs.
28. Dodman.—Mr. Cragg, 17 gs.
29. Hero, a chesnut cart stallion, two years old, by Young Conqueror.—Mr. Talbot, Kilkenny, 185 gs.
30. Captain, a chesnut Suffolk cart stallion, by the late Mr. T. Crisp's Duke.—Mr. J. Grout, 95 gs.

The property of Mr. Richard Garrett, of Carleton :

The Chaimant, a pure Suffolk cart stallion, by Cupbearer.—Earl Dudley, 200 gs.
 Challenger, a Suffolk cart stallion, by Cupbearer.—Mr. Westhorp, 100 gs.

Two lots, the property of the executors of the late Mr. James B. Cooper, of Blythburgh Lodge, and Mr. James Deck, of Westleton, were also sold at 62 gs. and 55 gs., and a number of other cart horses at lower figures.

Mr. Goodwyn's bullocks, cows, sheep, lambs, and dead stock were disposed of on Thursday. The result of the sale was between £8,000 and £9,000.

SHEEP SALES AND LETTINGS.

SALES OF LAMBS AT PERTH. — Messrs. McDonald and Fraser held their second special sale of store lambs. The numbers penned were over 8,000, of which 5,000 were crosses, 1,500 half and three-part breeds, and 1,500 blackfaced lambs. The attendance of buyers was large, and, from the beginning to the close of the sale, a steady demand was experienced for all sorts at prices similar to those realised at the special sale ten days ago. Cross lambs, best class of tops, sold from 17s. 6d. to 21s.; fair to good sorts of tops, same class, 13s. 3d. to 16s. 6d.; secondary sorts 10s. 3d. to 12s. 3d. Half and three-part bred lambs, best class of tops, 21s. to 25s.; fair to good, same class, 16s. 6d. to 18s. 6d.; secondary sorts, 14s. 6d. to 15s. 9d. Blackfaced middling ewe lambs, 10s. to 13s. Shotts, 7s. 6d. to 9s. Blackfaced wether lambs, 5s. 3d. to 10s. The usual weekly sale comprised 194 sheep, 121 cattle, and 3 cows. Both sheep and cattle met a slow sale. Cross hogs, secondary sorts, sold from 25s. to 27s. One-year-old cattle, £6 7s. 7d. to £8 10s.; two-year-olds, small sorts, £11 5s. to £13 17s. 6d. each.

MR C. CLARKE'S LINCOLNS. — At the sale at Scopwick the following purchases were made: Lot 1, Mr. J. Kirkham, 24 gs.; 2, Mr. Slater, 10 gs.; 3, ditto, 11 gs.; 4, Mr. T. Kirkham, 115 gs.; 5, Mr. Bond, 8 gs.; 6, Mr. Wiles, 9 gs.; 7, Mr. Foster, 13 gs.; 8, Mr. R. Kirkham, 15 gs.; 9, Mr. Stephenson, 10 gs.; 10, Mr. E. Paddison, 68 gs.; 11, Mr. Coleman, 45 gs.; 12, Mr. W. Dudding, 28 gs.; 13, Mr. P. Pichell, 8 gs.; 14, Mr. T. Pears, 14 gs.; 15, Mr. Chapman, 13½ gs.; 16, Mr. T. Caswell, 70 gs.; 17, Mr. Taylor, 7½ gs.; 18, Mr. Coleman, 9 gs.; 19, Mr. Tindall, 7½ gs.; 20, Mr. H. Mackenzie, 26 gs.; 21, Mr. Holmes, 21 gs.; 22, Mr. Slater, 48 gs.; 23, Mr. Marshall, 16 gs.; 24, Mr. Trotter, 7 gs.; 25, Mr. Marshall, 13 gs.; 26, Mr. Shillito, 20 gs.; 27, Mr. T. Pears, 13 gs.; 28, Mr. Mellows, 9 gs.; 29, Mr. Howard, 11 gs.; 30, Mr. C. Clarke, 20 gs.; 31, Mr. W. Gillatt, 36 gs.; 32, Mr. Holmes, 12 gs.; 33, Mr. H. Paddison, 7½ gs.; 34, Mr. Tindall, 6½ gs.; 35, Mr. G. Bland, 12½ gs.; 36, Mr. W. Dudding, 10 gs.; 37, Mr. Phillips, 8 gs.; 38, Mr. Mellows, 11 gs.; 39, Mr. Lamb, 7½ gs.; 40, Mr. T. Pears, 7½ gs.; 41, Mr. T. Stephenson, 7½ gs.; 42, Mr. Mann, 11 gs.; 43, Mr. Tindall, 6½ gs.; 44, Mr. W. Dudding, 11 gs.; 45, Mr. G. Bland, 8½ gs.; 46, Mr. W. Cappe, 10½ gs.; 47, Mr. Bainbridge, 6½ gs.; 48, Mr. White, 6½ gs.; 49, Mr. Wiles, 7 gs.; 50, Mr. Morris, 15 gs.; 51, Mr. Stephenson, 6½ gs.; 52, Mr. C. Paddison, 7½ gs.; 53, Mr. Harrison, 6 gs. Two-shears: 54, Messrs. Lister and Byron, 100 gs.; 58, Mr. Trotter, 12 gs. The entire lots made £1,082 11s., or an average of £19 13s. 8d. each.

MR. BORTON'S LEICESTERS. — At the sale at Barton, near Malton, Mr. Stafford, of Bedford, being the auctioneer, many of the sheep were bought for New Zealand, and several for Ireland. The following is the result of the sale:

SHEARLING RAMS. — Mr. Gray, 21 gs.; Mr. Smith, New Zealand, 20 gs., 15 gs., 22 gs., 30 gs., 12 gs., and 10 gs.; Mr. Key, Musley Bank, 16 gs. and 10 gs.; Hon. C. W. W. Fitzwilliam, M.P., 23 gs.; Mr. Humphrey, Leicester, 51 gs. and 32 gs.; Mr. Houlden, Wiggathorpe Hall, 66 gs.; Mr. Tinker, 8 gs.; Major Worsley 7½ gs.; Mr. Smithson, 11 gs.; Rev. C. P. Peach, 15 gs.; The Earl of Faversham, 10 gs. and 20 gs.; W. Robertson, Ireland, 8 gs., 10 gs., 9 gs., and 9 gs.; Mr. Cattle, Barton, 9 gs.; Mr. Leele, Fryton, 8½ gs.; Mr. West, 7½ gs., 8 gs., and 8 gs.; Admiral Howard, 10 gs.; Mr. Jackson, 17 gs.; Mr. Geo. Wright, Broughton, 40 gs.; Mr. Scoby, 10 gs.; Mr. Beech, Stockton, 10 gs.

TWO-SHEAR RAMS. — Mr. West, 8 gs. and 10 gs.; Mr. Robertson, 9 gs.; Mr. Smithson, 10 gs.; Mr. Tinker, 11 gs. and 30 gs.; Earl Faversham, 10 gs.; Mr. Beech, 18 gs., 10 gs., 12 gs., and 70 gs.; Mr. Hattersley, 10 gs.; Earl Fitzwilliam, 20 gs.

THREE-SHEAR RAMS. — Mr. Humphreys, 36 gs. and 33 gs.; Mr. Key, 14 gs.

SHEARLING EWES (Three in a lot). — Mr. Beech, 27 gs.; Mr. Holden, 43½ gs., 27 gs., and 27 gs.; Rev. C. P. Peach, 30 gs.; Mr. Tinker, 24 gs.; Mr. Allen, 24 gs.

MESSRS. DUDDING'S LINCOLNS. — Mr. Calthrop sold by public auction about seventy long-wooled rams, principally shearlings, the property of Messrs. Dudding, at Panton House, near Wragby. There were in all 70 lots; the first six being let, and the others, which comprised rams and four old sheep, sold. For No. 4 there was a very strong competition, and it was ultimately knocked down to Mr. Hesseltinge for 60 guineas. The competition of the day, however, was for lot 58. This number had evidently set their minds on obtaining, although the principal competitors came from the ranks of the colonists. The bidding speedily mounted up, and at last became confined to Mr. Buchanan and Mr. Coleman, to the latter of whom it was ultimately knocked down for 200 gs., amidst the cheers of those standing around the ring. Mr. Coleman afterwards became the purchaser of lot 64 for the sum of 175 gs. The sale was altogether a most successful one. The average of the six rams let was £33 13s. 4d.; of the four old sheep, £27 16s. 9d.; and of the rams sold £37 12s. 4d.; the total average being estimated at £36 12s. 11d. The following is the return of the prices realised:

RAM SALES AT HEREFORD. — Messrs. Edwards and Weaver sold a number of Shropshire rams, the property of Mr. F. Evans, Bredwardine, which were disposed of as follows: Four shearling rams, 35 gs., to Mr. J. Turner, Stanton-on-Arrow; shearling ram, 12 gs., to Mr. J. Like, Mausel Lacey; ditto, 8 gs., to Mr. S. Evans, Parton; ditto, 6 gs., to Mr. J. Marston; ditto, 7 gs., to Mr. Williams, Glasbury; ditto, 11½ gs., to Mr. Farr; ditto, 9 gs., to Mr. James, Monnington; ditto, 8½ gs., to Mr. G. Bray, Ilaven; ditto, 4 guineas, to Mr. Williams, Glasbury; ditto, 14 guineas, to Mr. Nicholas Price, The Thornes, Ledbury; ditto, 10 guineas, to Mr. H. Griffiths, Brick House; ditto, 8 guineas, to Mr. T. Goodwin, Hampton Bishop. Average £11 14s. 6d. The property of Col. Bridgford; scarling Shropshire ram, sold to Mr. Gwilliam, 5½ guineas; ditto to Mr. Hodges, The Moor, for 7½ guineas. Messrs. Iye and Sunderland disposed of large consignments of rams from the well-known flocks of Messrs. James and Embrey, Much Birch; Mr. T. Pearce, of Snod-hill; Mr. A. Davis, Dorston-court

&c., the former of which changed hands at from 5½ to 12½ guineas, averaging £8 2s. 6d. The Snod-hill rams went from 4½ to 10½ guineas, averaging £6 12s. The Dorston-court rams averaged £5 7s. 6d., and a few other small lots were sold at satisfactory prices.

MR. J. H. VESSEY'S LINCOLNS.—At Haulton Holgate there was a large attendance of buyers, several being from the antipodes, and the competition was very keen, especially between two gentlemen from New Zealand. One ram fetched the extraordinary figure of 200 gs., another 175, one 125, and one 110. There were 70 lots sold, and the total sum realised amounted to 2,450 gs., the average price of each sheep being 35 gs.

MR. RIGDEN'S SOUTHDOWNS.—The Hove Flock sale took place at Mr. Rigden's new residence in Goldstone Bottom. There was a large attendance of flockmasters from different parts of the country. 100 ewes and 27 rams were offered by Mr. E. Drawbridge, of Lindfield. The ewes were put up in lots of five each, 75 being full-mouthed and 25 shearlings. Mr. Clark, the Duke of Richmond's agent, secured five at six guineas each; the next lot at the same price to Mr. Field, the agent of the Duke of Portland. The third lot realised five guineas, and was bought by Mr. E. Cane, of Berwick; and the remainder of the full-mouthed ewes fetched prices varying from £2 10s. to £3 15s., the purchasers being the Duke of Portland, Mr. Kelsey, Mr. Smith (Paddockhurst), Mr. Dudney, Mr. Botting, Mr. Gorrige, and Mr. Phillips. The prices of the shearlings ranged from £3 to 3½ guineas; and four out of the five pens offered were bought by Sir Curtis Lamson, of Worth, Mr. Sharp being the purchaser of the other lot at £3 5s. per head. Ten rams were then offered for hire, but, notwithstanding the competition was keen at times, the prices obtained were not so great as at some of Mr. Rigden's sales in past years. The highest figure reached was 83 gs., at which sum Mr. Carew-Gibson obtained the services of the one-year-old animal that carried off the first prizes at Bristol and at Bedford; the next highest quotation being 50 gs., given by Mr. Greville, M.P., for a one-year-old, which received high commendation at those two shows. Mr. Hart, of Beddingham, gave 42 gs. for the ram (two years old) which carried off the first prize at Cardiff and second at Bedford; and the Duke of Portland possessed himself of the one-year-old which obtained second prize at Bristol, giving 41 gs. for it. The prices given for the others ranged from 12 gs. to 26 gs., and were hired, three by the Duke of Portland, one by Mr. More Stevens, one by Mons. Nouette Delorme, and the other by Mr. Oldacre. The rams for sale—seventeen in number, all (with one exception) being one-year-olds—were then put up and realised various prices, the lowest being 10 and the highest 46 gs.; M. Delorme being the purchaser of the animal last alluded to. He also secured two others at 31 and 34 gs. The other purchasers were the Duke of Beaufort (two), Mr. Carew-Gibson, Mr. Hart, Mr. Thornhill (two), Mr. Wodehouse, Mr. More-Stevens (two), Mr. Raikes, Mr. Phillips, Mr. Hempson, Mr. Wilson, Mr. Ellis, and Mr. J. Hodson.

MR. KIRKHAM'S LONGWOOLS.—At the luncheon which preceded the sale a testimonial portrait of Mr. Kirkham was presented by Colonel Amcotts who presided on the part of the subscribers. Seventy shearlings were subsequently offered by Mr. Briggs; one of which went to Messrs. Dudding at 200 gs.; another to Mr. Clark of Scopwick for 175 gs.; while Mr. E. J. Davy gave 68 gs. for a sheep; the Rev. T. O'Grady, 62 gs.; Mr. J. R. Kirkham, 62 gs.; Mr. Needham, 50 gs.; Mr. Buchanan, of New Zealand, 75 gs. for No. 61; Mr. Jones, 42 gs. for No. 19; Mr. E. Howard, 30 gs. for No. 62. The total amount was £2,291, or an average of £32 14s. 11d.

THE SELSEY SOUTHDOWNS.—A number of rams and ewes from Mr. Hugh H. Penfold's flock have lately been sold. Twenty-four rams were offered for letting, but the first, which took the first prize for ram lambs at Southampton last year, did not sell. Four yearlings, from the blood of Mr. T. Ellman's No. 14, were then knocked down to Mr. E. Hobgen (Sidlesham), 6½ gs.; Mr. G. Penfold (Wiggonholt), 7 gs.; Mr. S. Seward (Petersfield), 23½ gs.; and Mr. Tribe (Falmer, Lewes), 11 gs. The remainder of the yearlings were from Lord Walsingham's blood, and were taken by Mr. G. Duke (Blakehurst) at 3 gs.; Mr. Tribe, 7 gs.; Mr. G. Penfold, 5½ gs. and 8 gs.; Mr. R. Drewett (Peppering), 13½ gs.; Mr. W. Woods (Crow's Hall), 21½ gs.; Mr. E. Herrington (Pagham), 8½ gs.;

and Mr. T. Saxby (Firle, Lewes), 15 gs. Three two-year-olds from the same blood were taken by Mr. G. Duke, 13½ gs.; Mr. P. Ellis (Clayton Court), 9½ gs.; and Mr. C. Holgen (Shripney), 16½ gs. Four two-year-olds, from Mr. Ellman's blood, Mr. E. B. Green (Stoughton), 5½ gs.; Mr. G. Boniface (Ford), 10 gs.; Mr. S. V. Clarke (Kingston), 13 gs.; and Mr. G. Duke, 11½ gs. Two three-year-olds from Mr. Hart's No. 5, Mr. G. Blaker (Pangdean), 15½ gs.; and Mr. G. B. Green, 6½ gs. The rams for sale did not fetch high prices, and the ewes went cheap; 5½ gs. was the highest price for a ram, and 60 full-mouthed ewes were disposed of at from 44s. to 69s. a-head.

THE HAGLEY SHROPSHIRE.—This sale was held on August 3, and some animals from the flocks of Messrs. Webb, Kinver Hill; J. Harward, Winterfold; W. F. Firmstone, Hagley; and W. Yates, Grindle, were put up to competition. Mr. Hayward's highest price realised £7 17s. 6d. The Kinver Hill flock averaged a little over £3, the highest price being £11 11s. Of the eleven shearlings of Mr. Firmstone only six were sold, the best price being £6 16s. 6d. Mr. Yates' seven shearlings averaged £8 15s., the highest price being £15 15s.

MR. ROBINSON'S LINCOLNS.—At Huttoft, by Messrs. Mason and Sons.—The number offered was sixty-five, thirty-six of which were shearlings. Of these, No. 20 was hired by Mr. J. Byron, for £52 10s., No. 14 by Mr. W. Chatterton, for £42, and No. 10 by Mr. G. A. Oliver, for £22 1s. Mr. S. R. Kemp took the highest priced aged sheep, No. 52, for £31 10s. Mr. Chatterton took the second, No. 56, for £25 4s., and Mr. J. W. Parker the third, No. 54, for £21. The total amount realised by the letting was £879 18s., giving an average of about £13 11s.

THE OWERSBY RAMS.—Mr. Calthrop offered for sale 80 longwool shearling rams belonging to the representatives of the late Mr. John Davy; 79 of the 80 lots were speedily disposed of. There was considerable competition for No. 5, which was at last knocked down to Mr. Cartwright for £75. The top sheep of the day was No. 13, of which Mr. Havercroft became the purchaser for £100, No. 20, at £30, was knocked down to Sir J. D. Astley, Bart., M.P. The total sum realised was £1,567 13s., the average being £19 16s. 10½d.

THE AYLESBY RAMS.—A select company assembled at Aylesby Manor, to view the show rams bred by Mr. Torr. There were about 40 pure-bred Leicester exhibited, and of these 28 were let at an average of £17 15s. One of the rams was sold to a gentleman from New Zealand for £100.

THE GIVENDALE RAMS.—At the annual letting of these Leicesters, Mr. Boulton, of Malton, was the auctioneer. No. 1 shearling was let to Mr. Jordan, of Eastborne, for £34. The average was £11 14s. The two shears averaged over £9. The average of the aged sheep was over £9.

MR. CLARE'S SHROPSHIRE.—The business at Twycross commenced with Midshipman, a three-shear ram, by Mansion 3rd, falling to the lot of Mr. Baker, at 12 guineas. Then came a shearling, Captious, which fell to Mr. Sawidge, at 11 guineas. The Leicestershire prize sheep was bought by Mr. Peerman at 13 guineas; whilst the commended sheep made 20 guineas to Mr. Coxon; and another realised 22 gs. to Earl Howe. Other rams ranged from 18 guineas to five-and-a-half guineas. The ewes made a fair average for the season. The sale was conducted by Messrs. Davenport, German, and Allen, of Ashby-de-la-Zouch.

HEREFORD SALES.—Messrs. Pye and Sunderland's sales included upwards of 50 high-class rams, consigned by the following eminent breeders, viz: Mr. J. N. Downing's pure Ryelands, 22 in number, the competition for which was brisk, were purchased as follows: Lots 1 and 7, Mr. Hall, Kipple, 9 gs. and 14½ gs.; lot 2, Mr. T. H. Pitt, Freetown, 14 gs.; lot 3, Mr. Mutlow, 12½ gs.; lot 4, Mr. Hill, Newend, 7 gs.; lot 5, Mr. Downes, 7 gs.; lots 6 and 13, Mr. Wedge, 10 gs. and 7 gs.; lot 9, Mr. Williams, 7½ gs.; lot 10, Mr. Griffiths, 5½ gs.; lot 11, Mr. T. Duckham, 9½ gs.; lot 12, Mr. B. Galliers, 6 gs.; lot 14, Mr. Timaeus, 6½ gs.; lots 16 and 20, Mr. Powell, 6½ gs. each; lot 17, Mr. Vaughan, 5½ gs.; lot 19, Mr. Payne, Birch, 7 gs.; lot 20, Mr. Oakley, 5½ gs.; lot 22, Mr. James, 7 gs.; lot 23, Mr. Powell, Brecon, 6 gs.; lot 24, Mr. Vevers, Yarkhill, 5½ gs. The average price realised is 8 gs. Mr. Pulley's Shropshires, 6 of which were consigned and readily sold as follows: Lot 1, Mr. T. S.

Wathen, Coldbrook, 12 gs.; 2 and 3, Mr. Williams, Cowbridge, 7½ gs. and 7 gs.; 4, Mr. H. T. Taylor, Holmer, 9 gs.; 5 and 6, Mr. A. Goodwin, Wilmaston, 21 gs. The average price 11 gs. Mr. J. Waddell, Canon Bridge, pure Cotswolds, 8 in number, ranged from 5½ gs. to 8 gs., the purchasers being Messrs. Till (Bullingham), Blashill (Bridge), Large (Madley), Daw (Shenmore), Lydiatt (Dinedor), Matthews (Tiberton), and Morgan (Monkton). The average price 6 gs. Several other lots were disposed of at full average prices.

PETERBOROUGH RAM FAIR.—There were 800 sheep penned, being an increase of 302 over last year. The highest prices realised was £74 8s. for one of the Dunstan Dunstan Pillar flock (Mr. Cartwright's). It was purchased by Mr. Davey, who also gave 50 gs. for another out of the same pen. One of the Nocton Heath flock (Mr. Robert Wright's) fetched 58 gs., and another 52 gs. The Pointon Rams (Mr. T. Caswell's) made good prices, ranging from 50 gs. downwards, and the Langhton flock from 33 gs. Several of the latter were purchased for New Zealand. A number of Croxton Kerriell rams were let at good sums. The average prices obtained were—The Pointon, 18 gs.; the Buckminster, 14½ gs.; the Laughton, £18 6s. 6d.; the Kiroy Green, 10 gs.; Dowsby Hall, 8 gs.; Wellingore, 6½ gs.; Cranwell, 10 gs.; the Mere 13 gs.; Dunstan Pillar, £18 11s. 6d.; Mr. Looker's (Hartford, Hunts), £19; the Nocton Heath, £18 13s. 10d.; the Branston, 10 gs.

SHROPSHIRE AT SHREWSBURY.—The Shropshire Sheep Autumn Sale was held at Shrewsbury. The catalogue contained 349 rams and 2,665 ewes from the flocks of many leading breeders, and the attendance included buyers for Australia, the European continent, and various parts of the United Kingdom. The demand was good and competition spirited, the whole number being disposed of at satisfactory figures, including the following prices: For rams—Mr. Evan's from 84 gs. to 10 gs., Mr. Mansell's averaged 12 gs., Mr. Crane's averaged 18 gs., Lord Chesham's 30 gs., Mr. Thomas Tanner's 10 gs., Mr. Marson's 10 gs., Mr. Edwards' 16gs., Mr. Yates' 7gs., Mr. W.O. Foster's 11 gs., Mr. J.K. Fowler's 15 gs., Mr. Keeling's 11 gs., Colonel Dyott's, 9½ gs., Messrs. Fenn and Harding's 9 gs., Mr. Horton's 8 gs., Mr. Tanner's from 15 gs. to 7 gs., the Hon E. Kenyon's 15 gs. to 9 gs., Mr. J. B. Jones averaged 10 gs., Mr. J. W. Ninton's 15 gs., Mr. M. Williams' 9 gs., Mr. Andrews' 12 gs., Messrs. J. and G. Crane 7 gs., Mr. Bache 7 gs., Messrs. Ibb 5 gs., Mr. J. Horton 7 gs., Mr. Nock 7½ gs., Messrs. Wheeler and others 7 gs. The price of ewes ranged from 180s. to 55s., Mr. Foster's average being 3 gs., Mr. Andrews' 3 gs., Mr. Ninton's 3½ gs., Mr. Tanner's 4s., Mr. W. G. Preece's 4s. 2s. 6d., Mr. Bache's 60s., Mr. Horton's 63s., Mr. Barber's 45s. 6d., Mr. Lloyd's 63s., Mrs. Smith's 80s., Mr. Fowler's 44 15s., Mr. R. Everal's 60s., Mr. Nevett's 44 2s. 6d., Mr. J. Lee's 44 10s., and others from good flocks from 75s. to 55s. each. Mr. W. G. Preece of course conducted the sale.

SHROPSHIRE IN IRELAND.—The annual sale of Shropshire rams, belonging to Mr. J. L. Naper, took place at Lougherew. Mr. Preece auctioneer. 39 shearing Shropshire rams were sold at prices ranging up to £48 6s., paid by Mr. R. G. Cosby for a first prize ram; his highly commended ram having brought £25 4s. The average of the Shropshire shearing rams was £11 7s. The shearing ewes sold at prices ranging from 42s. to 60s., and stock ewes from 47s. to 71s. Ten shearing Leicester rams realised from £5 5s. to £12 12s., and Lambs up to 38s.

COL. LANE'S SHROPSHIRE, at the Echills Farm, King's Bromley. The rams sold at prices varying from 6gs. to 24gs., twenty averaging £9 16s. 4d., exclusive of a shearing, which was let for the season at 110gs. The ewes found customers at prices from 45s. to 81s. per head. Messrs. Winterton and Beale conducted the sale.

MR. BAKER'S SALE, at Moor Barns, near Atherstone, by Messrs. Lythall and Clarke. The first lot, a three-shear ram, was disposed of for 28gs. Another fetched 13gs. several 16gs., 15gs., 14gs., and smaller sums; the average being nearly 10gs. The ewes did not sell so well as usual, but the first lot of five prize shearlings were sold for 5½gs. each, and others realised from 56s. to 87s. each.

MISS ROSE'S SHROPSHIRE.—This sale took place at Mullaghmore, County Monaghan. The sale included over 200 Shropshire rams, ewes, and lambs; 70 Leicester rams and ewes, 17 pure Devon heifers, 16 Devon and cross-bred bullocks, with the following prices: Shrop-

shire rams 35 guineas to 8 guineas, ditto ewes 120s. to 60s. ditto lambs 50s. to 30s., Leicester rams 16 guineas to 5 guineas, ditto ewes 80s. to 50s., Devon heifers 45 guineas to 18 guineas, ditto and cross-bred bullocks (yearlings) about £13 a head. Mr. W. G. Preece, of Shrewsbury, conducted the sale.

THE LITTYWOOD SHROPSHIRE.—Mr. Charles Byrd's sale and letting took place at Littlywood Farm, near Stafford, when 31 rams and 100 ewes were disposed of by Mr. W. G. Preece. The rams realised from 25 to 10 guineas, and the 100 ewes averaged about £4.

MR. TURNER'S LONGWOOLS.—At Uleyby Grange, by Mr. Calthrop. The sheep, 60 in number, were offered, 49 sold, and 11 were withdrawn. The average was £12 9s. 4d. on the number sold. The plum of the flock was bought by Mr. Brady Nicholson, Stourton Grange, near Leeds, for £40.

MR. HAVERCROFT'S LINCOLNSHIRE LONGWOOLS.—The Wootton Dale flock was sold on Friday week, by Mr. Calthrop, at Wootton Dale, Barton-on-Humber. The 60 rams were sold at an average of over £16 per head.

CADEBY RAMS.—The sale of this first and direct branch of the Biscathorpe flock took place at the residence of Mr. J. W. Kirkham, at Cadeby. Forty shearlings were offered for sale, and the whole were sold. The lot realised £737 12s. 6d., the average being about £18 9s. The following are the particulars: Messrs. Brigg £12 12s., Young £36 15s., Needham £44 2s., Stokes £14 14s., Skipworth £23 2s., Parr £24 3s., Sharp £31 10s., Mackinder £16 18s., Hewson £16 16s., Hodgson £13 13s., Dawber £13 13s., Bennett £14 14s., Boynton £50 8s., D. G. Briggs £16 16s., Bennett £10 10s., Sharp £10 10s., Morley £13 2s., W. Wright £18 18s., Hodgson £10 10s., Calvert £16 16s., Parr £29 3s., Law £31 10s., Casswell £14 14s., Sharp £10 10s., Needham £18 7s. 6d., Twiddle £14 3s. 6d., Weightman £12 12s., Godfrey £10 10s., Swift £9 9s., Backer £10 10s., Westmoreland £10 10s., R. Houlden £9 9s., Morley £9 9s., Odling £13 13s., Sharp £27 6d., Chapman £7 17s. 6d., Hundley £7 7s., Halliday £12 12s., Chapman £9 9s., Calvert £14 3s. 6d.

LOUTH SEPTEMBER RAM FAIR.—This fair was held in The Quarry. Mr. John J. Clark's Welton-le-Wold flock of 30 long-wooled rams realised an average of not quite 12 guineas. The plum of the flock made 35 guineas. The Luttoft Grange sheep, the property of Mr. John Louth, Needham, realised an average of nearly 15 guineas, Mr. John Walisby, Kirkham, giving 40 guineas for the plum of the flock. Several others sold at high figures for New Zealand.

MR. CARPENTER'S HAMPSHIRE.—Messrs. Waters, Son, and Rawlence, of Salisbury, sold by auction at Lake Farm, the stock of Mr. Joseph Carpenter. The two-teeth ewes ranged from 110s. (Mr. Newton), down to 54s. per head, at which latter figure, however, only one lot was sold. Mr. Brine, of Gussage, was a purchaser at 71s. The four-teeth ewes from 55s. to 100s. (Mr. Dibben). The six-teeth ewes made from 55s. to 83s. (Mr. Dibben). The ram lambs fetched from 4gs. to 10gs., and one four-teeth ram realised 21gs. The highest price obtained for chilver lambs was 63s., the lowest 34s.; the general run being from 36s. to 45s. The cart horses, of which there were twelve, realised satisfactory prices. A Chesnut mare in foal fell to Mr. Read at 75s.; Mr. Blake gave 70gs. for a black mare in foal; and Mr. Pinkney was the purchaser of a Chesnut horse at 74gs. The lowest price 29gs. Two foals fetched 26gs. and 15gs.

MR. GALPIN'S HAMPSHIRE.—At Little Langford, by Messrs. Waters, Son, and Rawlence. The sale commenced with the two-teeth ewes, which reached an average of 56s. 6d. per head, the principal pens falling to Mr. J. Read at 75s., Mr. Newton at 70s., Mr. J. Friend at 66s., Mr. F. Moore at 65s., Mr. Smith at 62s., Mr. Blake at 61s., 58s., 57s., and 55s., and Mr. Andrews at 60s., 51s., and 49s. The four-teeth ewes brought an average of 54s. 6d. each, the chief purchasers being Mr. J. Friend at 64s., Mr. Blake at 64s., Mr. Taunton at 59s., Mr. Tabor at 58s., Mr. Torey at 56s., Mr. Hart at 55s., 54s., and 47s., Mr. Rawlins at 54s., Mr. Andrew at 55s., Mr. Read at 53s., and Mr. Hinxman at 50s. The average of the six-teeth ewes was 58s. 3d., the highest lots being secured Mr. Newton at 81s., Mr. Andrews at 70s., 57s., 54s., and 53s., Mr. F. Moor at 72s., Mr. W. Flower at 66s. and 63s., Mr. T. Parham at 62s., Mr. Blake at 61s., Mr. Torey at 61s., and Mr. Humby at 60s. The full-mouthed ewes averaged 48s. 6d., and the Chilver lambs 39s.

CAPT. TAYLOR'S DEVONS AND SOUTHDOWNS.—The first periodical sale of pedigree Devons and Southdowns, from the established herd and flock of Captain Taylor, took place at Priesthaws, Westham; Mr. Thornton the auctioneer. Ewes ranged from 40s. to 80s., the rams from 5gs. to 21gs., and the Devon cows and heifers from 15gs. to 28gs. The young bulls sold at 22gs. and 19gs. respectively.

SOUTHDOWN SHEEP AND SUSSEX CATTLE AT SANDGATE.—This annual sale took place at Sandgate, on the estate of Mr. G. C. Carew-Gibson. Twenty lots of ten full-mouthed Southdown ewes sold at from 38s. to 65s. a head. Mr. Botting bought at 65s., Mr. Plummer (Bolney) at 55s., Mr. Dendy (Cuckfield) at 42s., Mr. E. Tomkins at 42s., Mr. J. Tomkins at 40s. (three lots), Mr. Hyde (Angmering) at 40s. (four lots) and 38s., Mr. Marsh at 40s., Mr. Page (Perching) at 40s., Mr. Friend Duke at 40s. (three lots) and 38s., and Mr. Sharp and Mr. Howell at 38s. Two lots of ten two-tooth ewes were bought by Mr. Hylton (Upper Beeding) at 52s., and by Mr. Knight at 48s. Two lots of broken-mouthed ewes sold at 32s. and 36s., Mr. Howell being the purchaser. Twelve rams were offered for letting, but there was no demand. Mr. Humphrey (Ashington) hired two at 10gs. each—No. 2, a four-tooth, by Lord Walsingham's sheep, by Manchester Reserve, and No. 6, a shearing, by Mr. Ridden's sheep, which took second prize at Dorchester, Cardiff, Plymouth, and Hull. There were 22 rams for sale, which found purchasers at from 17gs. down to 9gs. A Sussex bull made 37gs., and 20 Sussex heifers went at prices ranging from 27gs. to 13gs.

THE BLENHEIM STOCK SALE.—The sale of live and dead stock, on the Park and Home Farms, which are now let, comprising 1,636 sheep, 90 head of Shorthorn cattle, 64 choice Scotch oxen and heifers, 20 horses and colts, 37 pure-bred Berkshire pigs, and a large and general assortment of agricultural implements. The attendance was very numerous, upwards of 5,000 persons being present. Messrs. Paxton and Castle were the auctioneers, and the sum realised over £8,000.

MR. GAMBLE'S SHORTHORNS, BY MR. WETHERELL.—A portion of Mr. Gamble's herd of Shorthorns was sold at Shouldhamthorpe, Downham, Norfolk. The summer drought affected that part of the country perhaps, more seriously than any other, and told greatly against the condition of the stock; and the absence of any of the Prudence tribe, one of the best of the late Lord Spencer's families, went against the prices, which were generally low. Lot 1, Florest and calf, brought 35gs.; lot 6, Coral, made 54gs., and Lady Agony 42gs.; the others, rising from 20gs., went up to 33gs. A young bull, Ould Coral, made 35gs., but there was no great demand for them. Mr. Brackenbury sold twenty-two head at the same time, which were quite a nice selection, the animals being well-shaped, with good countenance, and several fit to exhibit. They had been principally bred from Mr. Gamble's bulls, for nearly 40 years. A three-year-old heifer went as high as 110gs.; others made 55gs., 52gs., 46gs., and downwards. The twenty-two head sold realised £929 5s.

SHORTHORNS BY LYTHALL AND CLARKE AT THE MIDLAND COUNTIES REPOSITORY, BIRMINGHAM.—These were from the herds of Messrs. Holbeck, Barnett, Pulley, Upson, Whitehouse, G. Garne, and J. Beckford. The catalogue contained 31 cows and heifers, and 15 bulls. The following are the better prices: Lot 1, Lady Stuart, 53gs. (G. Garne); lot 4, Hellenor, 35gs. (Robothan); lot 6, Ammonia, 89gs. (Bennior); lot 7, Lady, Nore Burdett, 52gs. (Bradburn); lot 13, Helen 30gs. (Bradburn); lot 14, Miss Moseley, 38s.; lot 22, Maria Stuart, 46gs. (G. Garne); lot 28, Quality Fogg, 25gs. (Upson) The bulls made rather lower figures.

MR. C. TIMMIS' SHROPSHIRES.—At the Brick House, Stafford, by Mr. B. Lytham, about 30 shearling and 3 older rams, and 100 ewes. Lord Lichfield took the best, a three-shear ram, at 18gs., and the average of the rams was close upon 11gs., while the ewes ranged from 45s. to 92s., resulting in an average of nearly 60s. per head.

SHROPSHIRES IN BINGLEY HALL, BIRMINGHAM, on Thursday, September 17th, by Messrs. Lythall and Clarke.—Mr. E. Lythall's average was 11gs., Mr. T. Nock's 13gs., Lord Wenlock's 12gs. One of Mr. Joseph Pulley's rams, a two-shear, made 27gs., and a shearing 20gs. Mr. T. Jowitt's made 26gs., Earl of Zetland's average was

11gs.; Mr. Harcourt Griffin's average 13gs., a two-shear making 43gs.; Mr. T. J. Mansell's average was 9gs. Ewes: Mr. Tidy averaged 80s., Mr. B. Long averaged 63s., Mr. E. Jenkins 50s. to 57s., Mr. T. Watson 49s. to 53s., five young stock ewes from Mr. T. Wood, of Grendon, made 168s.

MR. GORRINGE'S SOUTHDOWNS AT KINGSTON-ON-SEA, SUSSEX, BY MR. THORNTON.—The shearling ewes were first offered, and sold at an average of about 55s. Mr. Ridden, Mr. Taylor (Glenbeigh), Mr. Steyning Beard, Mr. Bushby, Mr. F. D. Carew Gibson, Mr. Wemyss, were among the buyers. The 90 two-shear ewes topped the average with not quite 3gs., and fifty of these go to Mons. Barthes, France. The 100 three-shear just exceeded the average of the shearlings, the Rev. J. Goring, Mr. Cane, Mr. Humphrey, and Mr. Biel taking several pens. In the old ewes were some of the best sold, but a few pens going to the butcher reduced the average to 48s. The rams were principally shearlings, and three of these were put up for letting, and two of them taken, Mr. Steyning Beard one at 16gs., and Messrs. Page, Essex, the other at 10gs., while Mr. Verrall gave 15gs. for another. The others ranged from 5 to 16½gs.; the 29 averaging £11 4s. The sale realised a total of about £1,640.

LONG-WOOLLED RAMS IN EAST YORKSHIRE.—The flock of long-woolled Lincoln rams, the property of Mr. Richard Stephenson, of Hollym, were sold by auction at the Royal Station Hotel Yard, Hull, by Mr. C. B. Stamford, at an average of £8—one half from last year. Mr. Park sold the Ulrome Grange rams, the property of Mr. Boynton, Bridlington, at the same time. The average was £7 10s.

RAMS AT ROTIBURY.—On Thursday, Sept. 17, by Messrs. S. Donkio and Son, nearly four hundred Border Leicesters, shearing rams, half-bred, and Cheviot rams and tup lambs, from the flocks of breeders in the district, were brought to the hammer, and the whole were sold—upwards of 370 lots, nearly all the rams being sold singly—in four hours and seventeen minutes. The financial business was very ably managed by Mr. James Hope, of Felton. The following is a summary of the sale: Messrs. Morrison, average £3 8s. 9d.; S. Langdale, average £3 13s. 10½d.; Thompson, average £3 1s. 9½d.; Cairns, average £6 2s. 7½d.; Davidson, average £3 18s. 3d.; E. Allen, average £3 5s. 10d.; Mrs. Readhead, average £1 4s. 10d.; Messrs. Sproat, average £2 17s. 6d.; Shotton, average £3 15s. 8½d.; Hogg, average £4 7s. 7½d.; Hills, average £5 3s. 3½d.; Common, average £3 4s. 4½d.; Sir W. G. Armstrong, average £3 10s. 6½d.; Messrs. I. Langdale, average £5 17s. 8½d.; T. Allan, average £5 1s. 5d.; Dickman, average £9 3s. 3d.; Angus, average £3 19s. 3½d.; Trevelyan, average £4 17s. 9d.; Linn, average £3 3s. 4d.; Forster, £3 4s. 6½d.; Dixon, average £6 0s. 10d.; Bosanquet, average £6 10s. 6d.; J. Forster, average £3 6s.; Wealeans, average £3 6s. 8d.; Donkin, average £1 14s.; Riddell, average £1 1s. 6d.—total £1,648 18s. 6d.

EVESHAM RAM FAIR.—The supply of rams was rather in excess of the demand. Messrs. Smith and Righton sold a number of Shropshire Down rams from the flock of Mr. Randell, which averaged about eight guineas, the highest figure reached for a two-shear ram being sixteen guineas. Cotswolds were in force, and those of Mr. Walker, of Compton Abdale, averaged nearly twelve guineas. They were sold by Messrs. Acock and Hanks, of Stow-on-the-Wold. The Cotswolds of Mr. Fletcher, of Shipton, made an average of about eight guineas. The other auctioneers who disposed of rams were Mr. Villa, of Cheltenham, and Mr. Keck, of Shipton-under-Wychwood. Fat stock was scarce, and the trade was improved, beef making 8½d. to 9d., and mutton about the same.

THE LATE MRS. GUY'S SOUTHDOWNS AT HAMSEY, by Mr. H. Morris, of Lewes and Hailsham. Ewes averaged nearly 49s., and lambs were also sold at good a figure, the leading buyers being Mr. S. Leigh, Mr. C. Ellis, Mr. W. H. Taylor, Mr. Turner, Mr. Mills, Mr. Killick, Oxted, &c. The following is a summary of the sale of sheep and lambs: Five full-mouthed ewes by Emery rams 43s., five 41s., ten 40s., ten 42s., ten 42s., ten 42s., ten 38s., ten 39s., ten 41s., ten 38s., ten 41s., ten 41s., ten 39s., ten 40s., five 53s., five 52s., five 54s., ten 47s., ten 48s., ten 51s., ten 50s., ten 56s., ten 55s., ten 50s., ten 52s., ten 49s., ten 50s., ten 50s., ten 48s., ten 48s., ten 50s., twelve 48s. Five four-tooth ewes by Emery rams, and rams bred by Mr. Ellis, of Beddingham by an Elnan ram, 58s., five 61s., ten 60s., ten 50s., ten 55s.

ten 49s., ten 50s., ten 52s., ten 48s., ten 50s., ten 50s., ten 49s., ten 51s., ten 46s., ten 47s., ten 49s., ten 49s. Five two-tooth by Ellis rams, by an Ellman ram, 55s., five 57s., ten 51s., ten 54s., ten 56s., ten 51s., ten 48s., ten 54s., ten 52s., ten 50s., ten 50s., ten 52s., ten 51s., ten 51s., ten 52s., ten 53s., ten 50s., ten 48s. Ten Southdown lambs 34s., ten 27s., ten 32s., ten 31s., ten 33s., ten 31s., ten 27s., ten 32s., ten 34s., ten 33s., ten 31s., ten 27s., ten 32s., ten 29s., ten 26s., twenty 29s., twenty 29s. twenty 28s., twenty 26s. Eleven rams, four full-mouthed, five six-tooths, and two two-tooths, fetched respectively 57s., 50s., 95s., 60s., 52s. 6d., 110s., 6½ gs., 80s., 110s., 65s., and 35s.

PARTNEY GREAT SHEEP FAIR.—There was a large number of sheep in the fair on Friday. Ewes made from £17 to £30 each. Messrs. Mason and Son sold by auction the Huttoft Grange rams, the property of Mr. John Louth, Needham, at an average of over £13. No. 6 was sold to Mr. Bond, of Toynton for 28 gs., who afterwards refused 40 gs. for the same ram to go to Australia. Mr. Hesselstine, of Barton, secured No. 8 for 18 gs. Mr. E. J. Davy, of Tathwell, got No. 20 for the like figure. The flock of Mr. H. F. Kemp, Thurlby Grange, Alford, 44 in number, was then, offered. Mr. Little, of Blyborough, secured No. 4 for 30 gs. No. 8 18 gs., No. 9 15 gs., No. 10 31 gs., No. 14 12 gs., No. 21 14 gs. Mr. Williams, of Ashby-cum-Tenby, obtained No. 12 for 20 gs., and No. 17 for 18 gs. Mr. Clark, of Sales by bought No. 23 for 19 gs. Mr. Wells, of Withern, No. 27 for 15 gs., and No. 33 for 16 gs.

THE RAM FAIR AT LINCOLN.—Mr. T. P. Richardson, auctioneer, Lincoln, sold to Messrs. C. Lister, of Coleby; C. M. Ward, of Washington; and J. R. Eiland, of Ais-thorpe, with the following result: Mr. Lister's: Lot 1, Mr. F. Codd, 5½ gs.; 2, Mr. C. Adams, 5½ gs.; 3, Mr. Searson, 5½ gs.; 4, Mr. Pickworth, 7 gs.; 5, Mr. Pickworth, 7 gs.; 6, Mr. Taylor, 5 gs.; 7, Mr. Searson, 5½ gs.; 8, Mr. Taylor, 13½ gs.; 9, Mr. S. Steeper, 6½ gs.; 10, Mr. Rippon, 6½ gs.; 11, Mr. Wright, 8 gs.; 12, Mr. Wray, 12½ gs.; 13, Mr. Gaunt, 7 gs.; 14, Mr. Challens, 5½ gs.; 15, Mr. Rippon, 11½ gs.; 16, Mr. Tunnard, 5½ gs.; 17, Mr. Hales, 5½ gs.; 18, Mr. Tinley, 5½ gs.; 19, Mr. Pickett, 11 gs. Mr. C. Ward's: Lot 1, Mr. W. Dixon, 7½ gs.; 2, Mr. Godfrey, 5½ gs.; 3, Mr. Cartwright, 5½ gs.; 4, Mr. Swan, 6½ gs.; 5, Mr. B. Codd, 6½ gs.; 6, Mr. E. Griffin, 9½ gs.; 7, Mr. F. Mawer, 6½ gs.; 8, Mr. Lake, 5½ gs.; 9, Mr. Piekwell, 6½ gs.; 10, Mr. Mawer, 7 gs.; 11, Mr. J. M. Smith, 4½ gs.; 12, Mr. Godfrey, 5 gs.; 13, Mr. Dear, 6½ gs.; 14, Mr. Dear, 5 gs.; 15, Mr. Ilard, 5 gs.; 16, Mr. Dixon, 12 gs. Mr. J. R. Ealand's: Lot 1, Mr. Houldershaw, 5½ gs.; 2, Mr. Swift, 5½ gs.; 3, Mr. Maud, 6 gs.; 4, Mr. J. Coupland, 7½ gs.; 5, Mr. Buxton, 21 gs.; 6, Mr. Harding, 6½ gs.; 7, Mr. B. Codd, 6½ gs.; 8, Mr. Smith, 11½ gs.; 9, Mr. Mawer, 5½ gs.; 10, Mr. Curtis, 8½ gs.; 11, Mr. Sleightholme, 6½ gs.; 12, Mr. Sleightholme, 6½ gs.; 13, Mr. Clarke, 7 gs. Mr. E. Bailey sold 30 of Mr. Morley's, of Leadham, the prices realised running from 5½ gs. to 14 gs. each. Messrs. Briggs and Son offered 50 shearlings bred by Mr. Paddison, of Ingleby. Mr. C. F. Paddison gave 31 for one, Mr. Wright 28 gs., and Mr. R. Howard and Mr. Evens one each at 20 gs. The whole made £642 12s., or an average of £12 17s. The Messrs. Briggs also sold for Mr. Arthur Garfit, of Seothorne; Mr. Swann secured one for 21 gs., and Mr. Godson one at 17 gs. The lot, consisting of 21 animals, made a total £216 16s. 6d., or an average of £10 6s. 6d. each. The Branstons rams of Mr. Marshall were likewise offered by Messrs. Briggs and Son, and they fetched prices ranging from 6 to 10 gs. A dozen of Mr. Walsley's rams (Ranby) realised from 6 gs. to 13½ gs.

THE QUARTLY HERD OF DEVONS AND FLOCK OF EXMOORS.—Near fifty years ago Mr. James Quartly, like his father before him, took to the business of tanning and cattle-breeding, and the whole of the stock has been brought under the auctioneer's hammer at Molland, in the wildest district of North Devon, and almost at the foot of Exmoor. The flock of nearly 300 Exmoor sheep formed the first division of the sale, and the chief purchasers were Messrs. Babbage (Southmolton), Yeo (Swynbridge), Hitchcock (Southmolton), and Harris. Of these the largest buyer was Mr. Babbage. There were seventy full-mouthed ewes, in lots of ten each, and these averaged 38s., a head; 29s. was the lowest, and 55s. the highest price. The eighty three-year-old

wethers averaged 51s. each—the prices running from 40s. to 49s. The 110 two-year-old wethers brought in an average of 46s. each—the lowest price was 40s. and the highest 57s. each. Fourteen remained unsold. There were ten rams, but one of these having damaged his leg, was not offered. The purchasers of the nine were Mr. Lovelace, who gave 15 gs. for a very handsome one; Messrs. F. Slader (Highbury), Follett (Dulverton), Westcott (Dulverton), Tamlin (Windsor), C. Burdon (Swynbridge), Stranger, and C. Berrington; the average was £9, and the lowest price £4 10s. The total sum realised by the sale of the sheep was £531 13s. There were altogether 70 Devons offered; but the herd seemed hardly to come up to what some had expected, and prices were not so high as was anticipated. Topsy, a six-year-old cow, and whose grandsire was King of the Britons, went to Mr. Tapp, of the adjoining estate of Twithen, for 29 gs. Of the next best were Dolly Varden, a yearling heifer, whose grandsire was Duke of Flitton IV., and sire, Duke of Devon, and Bertha, a heifer calf, also from the same blood; the former went to Mr. Azariah Smith, Bradford Peverell, for 25 gs., and five less secured Bertha for Mr. Tapp. All but two of the cows and heifers were in calf by Butterfly, Baron, or Bismarek, and their prices varied from 16½ to 29 gs. Peaceful, a descendant of King of the Britons, out of a purchased dam, fetched 22 gs., at which price she was taken to Wales by the Rev. Mr. Morgan, brother of Lord Tredegar. Flora, calved in 1869, whose grandsire was Garibaldi 844, and sire Trio 941, fetched 24½ gs. from Mr. Pittfield, of Bridport, Dorset. Duchess, of the Baronet 781 stock, was taken by Mr. Yeo, Swynbridge, for 25 gs. Stately, calved in 1871, and got by a bull of Mr. Buller's, went to Mr. Pittfield for 20 gs. Pretty-maid, calved in 1871, sire Champion, grandsire Baronet (781), dam Peaceful (2904), became the property of Mr. Jaekman, of Hexworthy, Cornwall, for 23 guineas Saunders came with the character of a good breeder, but she was knocked down at 17 gs. to Mr. Pittfield. Buttercup, calved in 1872, sire Young Turk, grandsire Young Ensign, went for 20½ gs. to Mr. Loveband, Bishopsympton. Princess and Marchioness, both descended from the same stock, were also noticeable, the former went at 19 gs. to Mr. Norton, of Chulmleigh, and the latter to Mr. Hebditch, of Dorset, for 24½ gs. These twenty-nine cows and heifers fetched 579 gs., and averaged about 20 gs. each. The purchasers were Rev. Mr. Morgan, Messrs. Yeo (Swynbridge), Tapp (Twithen), Pittfield (Bridport), H. Wippell (Alphington), Jaekman (Hexworthy), Zalley, A. Wood (Ufeulme), Norton (Chulmleigh), Hebditch (Dorset), J. Beedel (Stoodleigh), Tamlin (Windsor), Loveband (Bishopsympton), W. Shapland (Northmolton), and Loosemore (Plymtree). There were but half-a-dozen heifer yearlings, three of them had for their grandsires Duke of Edinburgh (823), and two of them Duke of Flitton IV. they brought in 77 gs., and averaged 13 gs. each. The pur-chasers were Messrs. A. Smith, Norton, Tamlin, and Fether-ston (Wiveliscombe). The heifer-calves numbered thirteen, and in addition to Bertha, already mentioned, the most noticeable were Dora, by a bull of Mr. Passmore's, bought by Mr. Shapland for 9 gs., and Snow, sire Butterfly, grandsire Champion, which was sold to Mr. J. Milton. The lot realised 102 gs., giving an average of 8 gs. The thirteen were divided between Messrs. Tapp, J. Milton (Wiveliscombe), A. Capel (Wiveliscombe), Tamlin, W. Shapland, J. Westcott (Dulverton), and Passmore (Bishopsympton). The bulls were next brought out. The olders was Butterfly, calved in 1871, sire Champion, grandsire Baronet; he went for 26 gs. to Mr. Hartnoll, Swynbridge. The other bulls were yearlings, Baron by Old England, and Bismarek by Byron; the first was sold to Mr. Tapp for 23 gs., and Bismarek fetched 25 gs. from Mr. King, of Brompton. The three brought in 74 gs. The three bull-calves were—Pickwick, descended from Duke of Flitton IV., 11½ gs. to Mr. Martin, of Molland; Young England bought by Mr. Burdon (Swyn-bridge) for £13 10s., and Livingsstone fetched 15 gs. from Mr. Tazewell (Bridgwater). The sixteen steers brought £322 10s.; the lowest price for a pair was 10 gs., and the highest £50 10s. The disposal of these concluded the cattle sale, which realised altogether £1,212 10s. The horses, sixteen in number, were all bred by Mr. Quartly. The top price was for a five-year-old chestnut gelding up to eighteen stone with the hounds, which was sold to Mr. Bisset, of Anstey, at 85 gs. The total realised by the sale was about £2,300. Mr. Quartly now retires from farming.

FANCY STOCK SALES.

Within the last few days there have been two or three more than usually noticeable sales of stock; thus on Wednesday, in Leicestershire, where the Shorthorn has driven out the Longhorn, there was a sale of Shorthorns, the average for which exceeded anything on record in this country. As much however, had been anticipated, as immediately after the Duke of Devonshire's sale, at Holker, the same average for the females was, as it is said, offered Mr. Cheney and declined. Then, on Friday there occurred in Radnorshire a sale of Herefords, announced as THE HERD OF WONDERS, and worthy the notice of "the scientific and philanthropic promoters of agricultural progress throughout the world." On the same day Mr. Marjoribanks' herd of Anglo-Alderneys was offered to people about town who have a fancy for "rich dairy qualities;" while in the previous week the most celebrated breeder of Devons cleared out his reds from the Molland farm, at the very foot of Exmoor. Yet more remarkable is it that none of these different varieties were what is known as show stock. High as he may stand in his own neighbourhood, visitors to the Royal and Western meetings have never heard of Mr. Green as a breeder of Herefords; while Mr. Quartley has for a long season been content to look on and watch Messrs. Davey and Farthing fight out the battles of the North and Somerset Devons. Mr. Marjoribanks, again, though once famous in the Shorthorn ring, has done little more of late than make his mark with a Jersey steer at a local meeting; and the owners of high-bred Shorthorns now rarely deign to exhibit. With fashion and fancy running after them, they can afford to be very much above that sort of thing; whereas the other breeds clearly languish without the incentive of such an advertisement. Mr. Quartley does not show, and his Devons, full of the best blood made merely market prices; heifers and cows of high degree reached, for twenty-nine in number, to an average of barely 20 guineas, and nothing over 30 guineas. But it may be, well though they always stand at our Christmas shows, that the Devons are gradually narrowing their confines and growing out of use. Whereas, the Alderneys, as commonly so distinguished, are fast growing into repute, alike on and off the show-ground. And yet Mr. Marjoribanks had a very bad sale. Bred of course quite regardless of cost from the stock of Mr. Dauncey, Mr. Simpson, Mr. Duncan, and others, the forty-one cows and heifers, sold on Friday, reached to no better average than 34 gs.; whilst the four bulls realised amongst them 107 gs., or about "a pony" a-piece. But the Bushey sale of Jerseys spoke to an experiment, and more directly to the failure of that experiment. "The argument" here offered was that Jerseys should carry beef as well as give milk; and bred altogether from home stock, that is from sire and dam both calved in England, they have under special treatment grown into great coarse animals, sadly wanting many of the fine points of the Jersey, and more properly to be distinguished as the Anglo-Alderney, a whole-coloured or "self-coloured" beast as they call it, more, after the manner of the butcher than the dairy maid. This run, indeed, on greys, duns and fawns, is fast approaching an absurdity; and, as we said when at Mr. Dauncey's sale of seven years since, "the preference for a grey herd has nothing further to recommend it than a fancy, for the lemon and white and other parti-coloured cows from the Channel Islands are quite as good milkers as, if anything, they show more style and breeding than their Quaker-coated sisters." In truth, the Horwood greys were inclined to coarseness, but at the sale Mr. Marjoribanks' bailiff gave the top price, 100 gs., for

Landscape, a great lengthy cow, and her produce, as tried by Friday's sale, were scarcely worth rearing. There was a two-year out of her called Landlady, which looked more like a Scotch cross than a Jersey, and sold for 33 gs.; while an elder daughter was worse still, "mere beef," as a connoisseur said turning away in disgust, and she went for 28 gs.; two rather better but sadly coarse going at 37 and 40 gs. There were, no question, a few large handsome cows in the catalogue, which made more money; but the only brisk feature of the sale was for the calves, showing as these did more Jersey character, as so far not developed according to the system adopted at Bushey. But the general business was slow, and so little zest had followed a look through the herd, that one of the early lots was knocked down to Mr. Simpson for 32 gs., having come in from Mr. Duncan a few months back at 87 gs.

We draw two or three conclusions from this sale, as we must admit entirely in accordance with our previous opinions: people who go for beef in Jerseys are very likely to go wrong; there is little or nothing more to be said for greys and fawns than that this is a mere fancy, and to keep to the true type of the Jersey it will be necessary every now and then to have a fresh cross from the Island. Tried by Bushey, your Anglo-Alderney is often going far away from "the guinea stamp." Properly cultivated, however, there is no reason why the Jersey should not in his degree become as fashionable as the Shorthorn; although just now "everybody" would look to want one quite as much as the other. At the great Shorthorn sales of late it has been the outsider who has done so much to make the average, as, without being invidious, a run through the price-lists will show; whilst instead of animals dropping to half or a third of their previous price like the Bradwell cow at Bushey, they still keep increasing in value up to almost any age. Thus, at Underley the other day, Duchess Gwynne, the first lot offered, made at twelve years old 430 gs., having eight years previously been sold at Brampton for 60 gs., and two years subsequently by Mr. Foster for 180 gs. At the same sale Cherry Queen, the highest priced cow at 1,220 gs., goes back to Bolden's Brandy, bought by public auction some twenty years since for 33 gs. At the Holker sale of the same week Musical, sold to Sir Wilfrid Lawson for 360 gs., was purchased just a year since for 71 gs.; while the Roses of Raby, now the Duke's favourite tribe, are from a cow sold as a calf in 1862 for 76 gs. Oxford 14th was once priced at 20 gs.; while at Mr. Bates' sale in 1850 ten Oxfords reached to an average of under 59 gs.; and now gentlemen who are mere beginners at this business take them readily at thousands. But "with so much money about" something must be done with it, as it is not quite clear why Shorthorn cows or thorough-bred yearlings should monopolise all the best business. For much of this, at least in one direction, the outsider is answerable; and, until he comes to frequent the red Devon or white-faced ring, breeders must be content with such prices as they can afford to pay to each other. Still, if the old Duchess Gwynne, like the nails in the horse-shoe, can double her value every time she comes out up to twelve years old, surely a herd possessing so much of the blood of Governor, who bred up to twenty-six years old backed by a bull like Zealons, who is useful at half that age, should have made more money than did Mr. Green's Herefords. But the outsider did not open his cheque-book at Knighton, where a large company was composed mainly of men who had been educated in the school, and the sale, though a fairly good one, was not a wonder.

REVIEW OF THE CORN TRADE

DURING THE PAST MONTH.

The month of September has been unusually fine and warm, helping to clear up the arrears of harvest in the late districts and the North, where their condition was becoming doubtful from the frequent previous rain, while every kind of field preparation has been facilitated by the changes in the weather. The autumnal sowings seem to have the promise of a good seed-bed at an early period; so the plants will have a fair chance of establishment before the winter. The season, however, turns out to be one of unusual inequality in prices. Wheat, having the best reputation as to its yield, has suffered, as we think, unreasonably, for we have seen quite enough inferior samples to convince us that many a farmer has gone short; nor do we think there has been such an abundance as any where to justify a fall, from this time last year, of 17s. 4d. per qr., as shown by the averages. Why should the public be benefited as much as £2 12s. per annum for every family of four at the farmers' expense of 16s. 10½d. per acre, when the previous rates, considering the poor yield, were very moderate—that is, supposing the present not to exceed 36s. 8d. per acre? In some cases it will doubtless be more, but in others less. A rise of 5s. per qr. on the present low average—47s. 2d.—would only bring it to 52s. 2d.; that would right the growers, and yet give the public a considerable benefit, and we hope the late undue pressure will give place to what seems so equitable and just. Already a reaction has set in throughout France, and as the same reason for it exists here, we hope farmers to the same extent will succeed, and feel confident that as the season advances prices will find about their level. In Hungary there is a feeling of resistance as well as in France, though they certainly have one million quarters to spare for export, whereas England on the average only grows half its consumption. Germany shows the same disposition to resist. Belgium is reviving from the panic, and though Odessa feels it still, prices there were relatively higher than here, and a reaction was certain. After all, we must wait for more accurate returns to know how as a nation we have fared. But it seems something untoward, in an agriculturist's lot, to be threatened in his labour, serewed in his rent, and pressed by public opinion, for a moderately successful growth in his produce. Such a result would be turning an apparent success into a real disaster. The following were the prices recently quoted at the several places named: White Mayenne wheat at Paris 51s., red ditto 48s.; white at Bordeaux 50s.; wheat at Courtrai 50s., at Brussels 50s., at Antwerp 52s., at Liege 50s. 6d., at Maestrecht 50s.; new at Hambro' 50s. c. f. i., at Stettin 44s. f. o. b., at Cologne for November 44s., at Berlin for October 40s.; best new at Danzig 50s., red at Odessa 36s., finest red at Budapesth 48s.; soft white at San Francisco 47s. c. f. i.; spring red at New York 37s. 10d. per 480lbs.

Monday, the 31st August, not being included in last month's review, we call it the 1st of the present month (September). The supply of English Wheat was then moderate, and so were the foreign arrivals. The show of fresh samples on the Essex and Kentish stands was fair, but by no means large. There was therefore no further decline, but the demand was far from active, at the previous Monday's rates. The foreign trade had a more settled appearance, and there was a steady quiet trade at unaltered rates. Cargoes afloat not being numerous, there was no change of value to note. Wheat prices in the country appeared as yet unsettled, but the rates generally

realised were about 2s. per qr. higher than the quotations of London. The only change at Liverpool was a decline of 1d. to 2d. per cental on all descriptions of foreign, excepting red spring American. At Edinburgh and Leith values were unaltered, but Glasgow noted a reduction of 1s. per qr. The small business done in wheat at Dublin was at fully former quotations.

On the second Monday there was an increased supply of home-growth, and a considerable arrival of foreign, half being from America and some quantity from Australia. But the number of fresh samples from the near counties being limited, a steady trade was noted at the previous currency for all descriptions of fine English new, there being scarcely a sample of old. Danzig and all descriptions of foreign wheat, with the exception of Southern white, were unaltered in value; the latter being over-plentiful, was 1s. per qr. lower. Cargoes afloat not being numerous were unaltered in value. This week the irregularities of the country wheat trade were brought more to a level, some that had not fallen so heavily yielding to necessity, and others rather recovering from the depression so generally felt. But Liverpool, as if rebuking the London decline in white wheat, advanced for this sort 3d. per cental, with a further rise of 2d. on Friday. Though Edinburgh was steady as to wheat, and Leith firmer, Glasgow again gave way 6d. to 1s. per qr. No change was noted at Dublin, either in English or foreign wheat.

On the third Monday there was rather less English wheat, and the foreign arrivals fell off to one-third of the previous week. Again the show of fresh samples from Kent and Essex was limited, showing more dissatisfaction with London rates. Yet factors did not succeed in obtaining any increase over the previous values, and sales were only slow on those terms. There was, however, a fair foreign demand, especially for good old, at quite the previous currency. Cargoes afloat not being plentiful, prices were fully maintained. The country markets this week were generally steady, but mostly above London rates, not being so subject to the influence of large foreign arrivals. Liverpool on Tuesday noted slow sales, and on Friday there was a decline of 1d. to 2d. per cental on foreign. Edinburgh and Leith noted no change in wheat, but Glasgow this week recovered, and was 1s. dearer. The Dublin trade evinced signs of revival, being firm for both native and foreign qualities.

On the fourth Monday, the supply of home-growth was moderate, and that from abroad considerably reduced. The show of fresh samples on the Essex and Kentish stands was larger than of late, though not heavy. Fine qualities went off steadily at the previous Monday's rates, but inferior were difficult to place without some reduction. The foreign trade was quiet, there being no disposition the part of holders to press sales at any less money. Floating cargoes were unaltered in value.

The imports into London for four weeks were 28,638 qrs. English, 123,561 qrs. foreign wheat, against 31,130 qrs. English, 188,119 qrs. foreign in September, 1873. The London exports were 2,897 qrs., against 24,985 qrs. in 1873. The imports into the United Kingdom for four weeks ending 12th September were 3,613,264 cwt. wheat, 258,897 cwt flour, against 3,439,269 cwt wheat, 325,856 cwt. flour in 1873. The London averages commenced at 53s. 4d., and closed at 48s. 9d. The

general average opened at 37s. 3d. and closed at 47s. 2d., showing a reduction in four weeks of 10s. 1d. per qr.

The flour trade has been dull and declining ever since 24th August, when the top price of Town-made samples was reduced to 47s., Norfolks with difficulty bringing as much as 35s., and low sorts 32s. Barrels have also fallen to 26s., extra State at New York being only quoted 21s. 7d., and good flour at Paris to 37s. 6d. per sack.

Maize has lately advanced 2s. to 3s. per qr., notwithstanding liberal supplies, prices having previously risen in America, and the crop, being a partial failure at Odessa. In Hungary, &c., flat American has become worth 35s., and round sorts 37s. per qr., but as grinding barley has been gradually declining we scarcely think these high rates will last. The imports into London for four weeks were 72,040 qrs., against 53,846 qrs. in 1873.

Till the month was well advanced the supplies of new barley were scanty, it being too early for the malting season. French qualities were the first to appear, and brought 36s. to 40s., but fell subsequently to about 37s. Our own crop has since been appearing in fair quantities for the time of year, and has brought 44s. to 48s. for fine sorts. Foreign arrivals having lately been more liberal in grinding sorts they have been reduced about 2s. in value, such being procurable at 29s. to 33s. Other pig feed being dear we scarcely expect much lower rates. Fine malting 'Sibleat Hambro' was quoted as high as 51s., cost, freight, and insurance. The imports into London for four weeks were 3,424 qrs. British, 66,189 qrs. foreign, against 1,743 qrs. British, 8,782 qrs. foreign for the same period in 1873.

The malt trade has been very quiet through the month, more especially for old qualities, the new being preferred, its future value must of course be determined by the course of fine barley.

The oat trade has fluctuated with the supplies. The first market being over-charged with a double quantity rates gave way 6d. to 1s. per qr. for all sorts, but as the quantities, though still good, every week were lessened there was a reaction to a similar extent, excepting on the last Monday, when the abundance alone placed the market 6d. below its starting price. Fresh 36lbs. Russian sorts closed worth about 25s. 6d., 38lbs. 28s., and 40lbs. 30s., and Swedes in proportion, but the bulk of the supplies has consisted of inferior Russian, and the late long sitting of Parliament greatly kept up the demand. This grain is, therefore, relatively dear, and we fear the general deficiency of the crop, both here and on the Continent, will keep it so all through the season. The imports into London for four weeks were 2,741 qrs. English, 160 qrs. Scotch, 700 qrs. Irish, 316,737 qrs. foreign, against 2,396 qrs. English, 75 qrs. Irish, 241,203 qrs. foreign in 1873.

The bean trade has been rather against buyers all through the month, from the very short stocks in the country and the lightness of the crop, though the quality has turned out very fine. New harrows have become worth 47s. to 48s., and extra fine old to 56s., 'Egyptian' 43s. to 44s., Italian and French 45s. Maize may be a check upon any material advance as well as grinding barley, while Rivett wheat at 43s. may be used for feeding as a cheaper substitute. The imports into London for four weeks were 1,292 qrs. English, 7,307 qrs. foreign, against 1,497 qrs. English, 8,927 qrs. foreign in 1873.

The stock of old peas being limited and the English supplies hitherto small, this pulse has also rather hardened in value—say to the extent of 1s. per qr. There has been a large consumption of old white Canadian as horse food, though as white boilers they have not been in demand; pig-feeding sorts being sent up sparingly have also brought the same advance, duns being worth 44s. to

45s.; maples have become quite a fancy article from their scarcity, and whites have readily sold at 46s. Should the next winter be severe and cause a demand for boilers they would of course be susceptible of a further advance. The imports into London for four weeks were 2,424 qrs. English, 6,390 qrs. foreign, against 2,135 qrs. English, 7,790 qrs. foreign 1873.

The linseed trade, with moderate receipts, has been steady and unaltered all through the month. The imports were 25,495 against 27,251 qrs. in 1873.

In cloverseed but little has been passing, stocks being too limited for speculative purposes, and holders too firm to induce buyers to come forward. Here the crop is considered short, in some parts of France it is reckoned good, but no large transactions have yet taken place, and prices were not settled. Winter Tares have been rather more in demand, at 8s. to 9s. per bushel for fine qualities.

THE LONDON AND COUNTY BANK opens—
DRAWING ACCOUNTS with Commercial Houses and Private Individuals, either upon the plan usually adopted by other Bankers, or by charging a small Commission to those persons to whom it may not be convenient to sustain an agreed Permanent Balance.

DEPOSIT ACCOUNTS.—Deposit Receipts are issued for sums of Money placed upon these Accounts, and Interest is allowed for such periods and at such rates as may be agreed upon, reference being had to the state of the Money Market.

CIRCULAR NOTES AND LETTERS OF CREDIT are issued, payable in the principal Cities and Towns of the Continent, in Australia, Canada, India, and China, the United States, and elsewhere.

The Agency of Foreign and Country Banks is undertaken.
The PURCHASE and SALE of Government and other Stocks, of English or Foreign Shares effected, and DIVIDENDS, ANNUITIES, &c., received for Customers of the Bank.

Great facilities are also afforded to the Customers of the Bank for the receipt of Money from the Towns where the Company has Branches.

The Officers of the Bank are bound not to disclose the transactions of any of its Customers.
By Order of the Directors, WM. McKEWAN, } Joint General
WHITBREAD TOMSON, } Managers.

Twenty-seventh Edition.

WARREN'S FARMER'S ACCOUNT BOOK.

PRICES: Folio, for large farms, 8s.; quarto, for small farms, and for schools where youths are trained for Agricultural Pursuits, 5s. Also, folio, with pages for a weekly instead of a daily account of labour, 7s.

Royston: John Warren. London: Simpkin, Marshall, and Co.; Whittaker and Co.; Longman and Co.; Ridgway.

No. 5, Vol. XLVI.]

QUEEN MARY:

A ROYAL SHORTHORN HEIFER, THE PROPERTY OF THE REV. R. B. KENNARD, OF THE RECTORY,
MARNHULL, BLANDFORD.

*Omnes exsuperans formâ Regina Maria,
Hoc sibi grande decus pulchra juvenca tulit.*

Queen Mary, roan, calved July 11, 1872, and bred by Mr. Kennard, at Marnhull, is by Grand Duke of Oxford (28763), out of Queen Ann by Lord Stanley 2nd (26745), her dam Queen Bertha by Maccaroni (24498)—Mildred by Duke of Norfolk (17735)—Moss Rose by Fanatic (17828)—Lily by Lillivick (10421)—Delight by Nelson (4547)—Dahlia by Milton (8315)—Lily by Merlin (2302)—by Midas (435)—by Dentou (198).

Grand Duke of Oxford (28763), a roan bred by Lord Braybrooke and calved on May 23rd, 1870, but who early passed into Mr. Kennard's possession, is by Clara's Rose (25784), out of Grand Duchess of Oxford by Seventh Grand Duke (19877), her dam Duchess of Oxford by Rembrandt (13587)—Duchess Nancy by Jasper (11609)—Duchess Nancy by Second Duke of Oxford (9046)—by Second Duke of Northumberland (3646)—by Belvidere (1706)—by son of Second Hubbaek (2683)—a cow of Mr. Bates', of Kirklevington.

Queen Mary is the winner of the following prizes: In 1873, as a heifer-calf, first prize at the meeting of the Bath and West of England Society at Plymouth, in June; first prize at the meeting of the Royal Counties Society at Southampton, in June; first prize, as yearling heifer, at the Woreestershire Show at Evesham, in August.

In 1874, as a yearling heifer, first prize at the meeting of the Bath and West of England Society at Bristol, in June; first prize at the Essex County Show at Stratford, and the Essex Challenge Cup of 100 guineas, as the best Shorthorn in the show, open to the United Kingdom, in June; first prize at the meeting of the Royal Agricultural Society at Bedford, in July; first prize at the meeting of the Gloucester Agricultural Society at Tewkesbury, and the Gloucester Challenge Cup of 100 guineas, as the best Shorthorn in the show, open to the United Kingdom, in July.

We thus wrote of this famous heifer at Bristol: "Straight and square, with a beautiful coat, and of good quality, Queen Mary is yet more promising than when she came out at Plymouth in 1873, when we thus spoke of her: 'Mr. Kennard's calf was quite in keeping for good points with the other winners amongst the Shorthorn females, having touch, hair, and style; and she was a long way in advance of the rest of the class.'" At Bedford, speaking of the champion Shorthorn of the time, we said there were some well-merited commendations beyond the prizes in the Shorthorn yearling heifer class, but these were nowhere near the Regina Maria, which has already beaten Telemachus, Vivandière, Victoria Viatrix, Lord Godolphin, and Baroness Conyers on their merits.

THE WINTER SESSION.

A polite refresher from Piccadilly serves not only to remind members who wish to see the next Smithfield show that they should pay up their subscriptions, but, even further, that Christmas is coming and both town and country getting back to London. By the last day in October or the first Monday in November the entries close for Birmingham and Islington, as some other more local meetings will reckon up the strength of their classes much about the same time. The Council of the Smithfield Club will again decline to receive any animal which has been exhibited about the country within a month of its arrival at the Agricultural Hall; but there is a very attractive provincial tour open to any star who may not

care to tread the London boards. Thus, he may open at Manchester, and shirking the last day at the Pomona Palace, travel on for a next appearance at Oakham, while he may wind up one week and draw a deal of company during the next in Birmingham. After a few days' welcome rest he shall turn up again at Leeds, and in due course get through the labours of a month or so at Newcastle on this side of the Border or in Edinburgh on the other. Verily, the life of a prize beast is not all mangel and cake. During the earlier part of this same period a number of now concomitant root shows will be held, such as Sutton's Royal in Reading, Carter's Royal in London, King's at Coggeshall, and Webb's at Wordsley;

while on the last day of October the entries will also close for the Farm Prizes of Somersetshire, as offered by the Royal Agricultural Society, and extending to no less than three classes—Hill Farms, Dairy Farms, and other Farms.

This, however, is somewhat in anticipation, for life in London really begins again with the discussions of The Farmers' Club, and the consideration of a paper by Mr. James Howard on OUR VILLAGES: THEIR SANITARY REFORM. There is certainly a smack of novelty about this subject, which may afford us a look at the labourer in another light. The main topic of the Autumn meetings, the more especially as taken up by the landlords, has been the working-man's case, and wearisome enough has this become; but as a question of health there is every opportunity of doing a deal more to develop an Englishman's love for *sweet* home. On the Tuesday the meeting of the Central Chamber of Agriculture will follow; and on the Wednesday that of the Council of the Royal Agricultural Society in Hanoversquare, when it is possible that something more may be heard of the suggestions offered on Bedford race-course, more particularly perhaps as regards the appointment of judges.

The Chamber Council has thrown out a series of questions, which promise to lead to an almost interminable discussion. They run thus: 1. Is an entire re-organisation of our road system in England, including the management and maintenance of turnpikes and highways desirable? 2. Is a re-classification of all roads needed? 3. How many different classes of roads should be established under a new system? 4. How should the funds be raised, and from what sources, for the maintenance of each class of road? 5. What should be the constitution of the governing body of the whole, or of any one class of roads? Unlike our villages, our highways are getting very worn, as apparently commanding less and less interest. At the meeting of the new Bucks Chamber in Aylesbury the other day there were not more than half a dozen people present, even with two papers read, and no resolution arrived at; although the opening address from the chairman "had the help of one of the members of the present Government. Mr. Selater Booth." Still, this half-dozen "House" at Aylesbury was by no means unanimous as to what was best to be done, no more than the dozen or so which at

the call of the East Suffolk Chamber made up a meeting at Ipswich. It was here decided by five to four not to answer the questions put by the Central Chamber, and by seven to three that "it will be necessary to understand what will be the tendency of future legislation," or, in other words, as a rider ran, "what is the opinion of the Government." This cannot count for much, if the people with a grievance have no opinion of their own to put forward. Then, in West Suffolk on Wednesday, nine *versus* three decided against the proposal for appointing a general inspector, half the meeting having apparently gone away before the business was over; while at York, on Thursday a company of just a dozen was very nicely balanced, six going for and six against two classes of roads; although at Peterborough they ask for *three*. The Committee, at least, of the Leicestershire Chamber has adopted a more decisive course, and the following replies to the Central circular were put into our hands during the past week: 1. That it is desirable to re-organise the system of highway management in so far as making the Highway Act of 1862 and 1864 compulsory, and to include the whole management of the turnpikes by the District Highway Boards. 2. Only so far as implied by the answers to the first and third questions. 3. Two. 4. As at present for the highway, but all roads that have been turnpikes should be assisted to the amount of one-half of the expense of repairs from the Consolidated Funds, and the other half from the common fund of the highway district. 5. Highway Boards. It is only right to say that a leading member of another Chamber objected to the "system" recommended here so soon as he heard of it; but the general meeting in Leicester on Saturday went very much with the Committee. Whatever may be the nature of any further answers received, the Central Chamber should encounter at its next meeting even more than the ordinary difficulty in framing and carrying a resolution. The catechism put forth does not so far seem to have done much to further such an object; as the discussions have been attended with continual divisions, and the meetings pretty generally small, tame, and forced. By far the most telling discussion has been that held at Norwich on Saturday, when, at the instance of Mr. Sewell Read, another important demonstration was made in favour of the establishment of County Boards, as distinguished from Quarter Sessions' or mere magistrates' business.

THE AGRICULTURE OF DENMARK.

Between Denmark and this country there existed in early times the most intimate relations, but the causes which led to the migration of the people from these northern latitudes can only faintly be discerned. The submersion of considerable tracts of land by the overflow of the waters around the shores of the Baltic, followed by the distress of the inhabitants, was probably in operation; as the same combination of causes has since driven the Anglo-Saxon race to people America and Australia. From our Scandinavian ancestors much that is practical, energetic, and good in the English and Scotch character has been inherited; and the community of feeling that ought to subsist between kindred races has been happily strengthened by the union of the Heir Apparent to the British throne with one of the Princesses of Denmark. The existence of steam power has made one of the most disjointed kingdoms in Europe the most compact, and the facilities for transporting produce to London and our manufacturing districts has practically added another county to England. All the islands

and the towns on the Baltic side of the peninsula have thereby been connected with each other and with the capital. Along the northern coast for an extent of nearly three hundred miles, which could not be approached by sailing vessels of any ordinary size, owing to sand-banks and the want of harbours, steam has restored to navigation the only advantage which the ancient mariners in their small vessels with sails and oars had over the modern.

The capabilities of the country are essentially agricultural. It has no minerals, no water power, from the want of running streams, no fuel for steam-power, no trade or manufactures, except for the supply of its own agricultural population. In all these respects the natural capabilities of Denmark stand out in strange contrast to England. The great progress made everywhere of late years in the science of agriculture has extended to this country, and its productive resources continue from year to year to develop. Its corn production especially has greatly increased. The prominence given to the dairy in all agricultural operations, whether upon the large or the smallest scale, denote the excess of

grain beyond the wants of the inhabitants. The large dairy farms and baronial estates are almost confined to the east-side land along the Baltic, and the rest of the country is in the hands of small proprietors. Here we find that the tendency to the division of land into portions too small to afford the owner a civilised subsistence is counteracted by causes which do not exist in France and Belgium. There are certain natural seasons in operation: the shortness of the spring season prevents spade husbandry; the want of any building material that is cheap and on the spot, and the severity of the winter requiring substantial houses for all kinds of stock and crops. The fuel also, peat, although cheaper than wood, costs something, and a piece of land without a peat moss, or a privilege in a moss, would be untenable if it were too small to yield any but a bare subsistence. Amongst even the lowest of the labouring classes, the high standard of education induces a high standard of living as regards food and lodging; the tendency therefore of the peasantry is to augment, not to divide and diminish their land; and it is not at all an uncommon thing for them to club together and purchase crown lands or other estates, and then divide the property amongst themselves according to their share in the purchase.

Agriculture and cattle rearing are the chief pursuit and staple wealth of the country, and whilst the productive power of the land has extended, the principal market for the agricultural produce is Great Britain, other countries receiving but little in comparison with ourselves. The yearly average export of corn for British account may be calculated at about 1,319,000 imperial quarters, or nearly the whole of the surplus cereal harvest; of this quantity about half is barley, which is much liked in England for malting purposes. Danish butter also commands a good price in the English and Scotch markets, especially the latter, for the Leith market prices depend much on the supplies from Denmark. The produce of agriculture in 1872 was greater than in any preceding year. The export of corn, of which the largest proportion consisted of barley, amounted to 3,691,730 tonner, or 1,000,000 more than the average shipments of the foregoing seven years. The export of flour showed also an increase of 52,000 barrels. The export of horned cattle was very great; it amounted to 45,984 head, against 37,086 in 1864-71. Sheep to the number of 17,313 were exported, which is about three times above the average of the same period. The fattening and rearing of pigs had increased, and the numbers exported were 111,637, compared with the annual average of only 25,843. In 1872 there were 101,234 barrels of butter exported, compared with an average export of 47,369 barrels. The net value of the agricultural produce amounted to 51,250,000 rix-dollars, whilst the average value of the previous seven years amounted to 23,000,000 rix-dollars, which shows an increase of 18,250,000 rix-dollars. Of the total amount, 27½ millions of rix-dollars is obtained from the export of cereals, which had increased by 8,500,000 rix-dollars, and 23½ millions of rix-dollars from the export of cattle and their produce, which had increased more than 10,000,000. Of the latter amount 8,000,000 relates to the export of butter, 6,500,000 to that of horned cattle, more than 3½ millions of pounds to that of pigs, 2,500,000 to horses, and 2,500,000 to pork and butchers' meat.

The efforts of the Danish agriculturist have hitherto been chiefly directed to the cultivation of corn and cattle rearing, but at present the tendency is to decrease their cereal and increase their dairy produce and live stock, as being likely to yield a steady return. The potato has been grown chiefly for home consumption and for cattle fodder, and the frequent appearance of the disease has led the Danes to depend less upon it than other agricultural pro-

duce; the yearly sowings are about 400,000 barrels. Considerable quantities of rapeseed are pressed for oil and the cake used for cattle-feeding, but as it is in this climate a difficult plant to rear and often fails, no effort is made to extend its cultivation. Linseed, hemp, and hops are grown to some extent; but their quantities are unimportant. Cattle-breeding is greatly improved, and more importance is now attached to the increase of good stocks, both from native and foreign breeds. The fodder question had also occupied the attention of the agriculturist, and the import of oilcake is increasing; during the year 1864-5 7,500,000 lbs. above the import were exported, whereas during 1872 6,000,000 lbs. oilcake above the export were imported. The result has shown itself in the increase of the export of cattle, pigs and butter. In dairy produce much improvement had also been made, the cold-water method gaining ground. A dairy with the accessory of ice had been successfully constructed, being the first of its kind introduced into the country. The production of butter in sealed tins for Transatlantic consumption has been largely taken up. Danish butter has even found its way to the Egyptian markets. The use of artificial manure has also increased; 12,500,000 lbs. were imported in 1872 against 8½ millions of pounds in 1871, and that of natural manure increased from 14,000,000 to 21,000,000 lbs. in the latter year.

The conclusion to be drawn from all these facts is that very remarkable activity is noticeable in the agricultural operations of the little kingdom of Denmark; whilst the increased facilities for communication by land and water has naturally increased the value of all Danish produce. The port of Aarhus has become the chief place of export for cattle and agricultural produce to Great Britain. In 1865, after the cessation of the war with Germany, there arose a desire among the merchants at the capital and throughout Jutland to export the agricultural produce of the province and its live stock direct to England, on a larger scale than had hitherto been practised, the greater portion of this traffic having, previous to the war, been effected through Hamburg and other Holstein ports. The English shipowners were induced to run some of their steamers, and a direct communication with Great Britain was commenced both by steam and sailing vessels. Since then the number employed has somewhat decreased, owing to the Danes themselves having taken a share in this carrying traffic. The trade itself has, however, continued to increase; next to Copenhagen Aarhus carries on the largest commerce with Great Britain.

THE MODERN MARIUS.—On the face of it Mr. Clare Read was appropriately placed as Secretary to the Local Government Board, or no doubt he must have been born a poor-law guardian. Somehow, after he was in office, he seemed to have a pensive—nay, lugubrious—look, and he accounted for this in a speech to his constituents a few days since. It seems that he likes official duties well enough, but even in regard to them his expression was not hearty, whereas he uttered a melancholy jeremiad on what may be called his corporate Ministerial duties. He is sorely tried by those functions of subordinate officials which are more imperative than those of their immediate offices—namely, those of making a house and keeping a house from four o'clock one day to any hour the next morning. Certainly, sometimes when he has been sitting on the Treasury bench deep in the small hours his attitude and demeanour and expression of face were somehow suggestive of Marius amidst the ruins of Carthage. No doubt he has often heard "bright chanticleer proclaim the morn" with pleasure, but then he had not to sit up all night to meet the cheerful bird. He is a representative man in the Administration, and it is to be hoped that he will be able to mould himself to the discomforts which he deplures.—*The Illustrated News.*

THE 12TH CLAUSE.

There can be no question but that the farmers as a body have long since ceased to take much interest in the new Parliament. They lost heart, for they felt they had been thrown over; as perhaps the best evidence of this has been the tone of indifference which has pretty generally characterised the autumn gatherings—"their tameness is shocking to see." As the Session passed away the agriculturist only saw day by day more clearly how remote was the chance of his ever having a hearing. And yet this is all his own fault, as he has just been coolly told by a large landed proprietor at a meeting in Nottinghamshire—"the farmers now had more power than the landlords; the present Parliament, so far as the county constituencies went, was elected under the ballot, and it was really the tenant farmers who had made the opposition to the 12th clause of the Tenant-Right Bill so strong." This is tolerably plain speaking; and henceforth, if the farmer should ever think it worth while to grumble again about no attention being paid to his case, he may expect to hear in answer from some sympathising landlord how "he did it himself—he voted by ballot—why did he not vote for somebody who would do what he wanted?" And Mr. Nevile, the Nottinghamshire landlord, said so much anent Mr. Sewell Read's declaration that "there were not twenty men in the House of Commons who would pass the 12th clause." And as Mr. Nevile quoted Mr. Read no further, such a statement standing alone sounds sufficiently alarming; but in common fairness Mr. Nevile should have gone on to show that Mr. Read himself is one of this miserable minority, as he "would not cross a room to support any measure from which the 12th clause was struck out." Thus, Mr. Nevile and Mr. Read are as directly at issue over this business, when their relative positions are looked to, as it is possible for any two men to be.

Mr. Nevile, indeed, some time since delivered himself of a lengthy address, the text of which was Freedom of Contract; just as Lord Fortescue at Exeter, on only Friday last, was "opposed to legislative interference in this matter. It was very undesirable indeed, where it could be helped, to interfere with the discretion of adults, who ought to look after their own interests. *Prima facie* all interference with liberty of contract and agreement was in itself an evil which required to be counterbalanced by some very clear and decided advantage. Such interference with the liberty of the subject had a debilitating influence on the character of the people who were thus held in leading-strings," and so on. As has been shown over and over again, the Legislature is continually interfering with freedom of contract, as the phrase goes, and dictating with every advantage the terms upon which the strong man shall deal with the weak, the employer with the employed, the master with the apprentice, the buyer with the seller. As to the imperative necessity under the altered circumstances of agriculture for some improvement in the relations between the owners and occupiers of land, it is only to be hoped that for the sake of the public Lord Fortescue and Mr. Nevile are prepared to admit so much; while as to such interference here conducing to any moral debility amongst the people whose interests are thus protected, we must hold to precisely the contrary proposition.

When some years since The Farmers' Club strung together a series of reasons for making the Tenant-Right principle general in its action, it declared emphatically that "uncertainty impedes energy, and justice made subservient to caprice is no justice at all, as it assumes the

power of might rather than the claim of right." And without the 12th clause justice will still be dependent on caprice or something worse. The Devoushire Chamber of Agriculture passed a resolution much in accordance with Lord Fortescue's views—viz., that the landowner should be answerable for compensation or not, just as he pleased to rule it: and in the same week at a meeting of the Devon and Cornwall Chamber of Agriculture, the following proposal was unanimously adopted: "That the present position of agriculture and the general welfare of the country require early legislation respecting the tenure and occupation of land. That legislation for the purpose of protecting the landlord's property and the tenant's capital should be compulsory excepting in cases where they are mutually and fully protected by lease or agreement." This is about the most straightforward demonstration made for a long day, representing as it really does the opinions of the farmers themselves, when uninfluenced by others. And it is for this the farmers and their friends—if they have any—must harden their hearts to go; for as Mr. Snell, who moved the resolution, said, "a permissive bill would not be worth the paper it was printed on, but be a snare, a mockery, and a delusion." Just as Mr. John Fowler said under the Chiltern hills on Wednesday, "without the 12th clause being carried any bill which Government might bring forward on the question would be utterly useless and of not the least benefit to the tenant-farmer;" or as Mr. Sewell Read puts it, "not worth crossing a room to support." But already the farmers do not quite stand alone, for at Retford Mr. Foljambe, the chairman of the meeting, a large landowner in the county, and, moreover, a member of the House of Commons, declared in opposition to Mr. Nevile, that "he disliked permissive bills, and he thought that any measure should apply to all alike, and be equally binding on all. To take any other course would be unfair." With this before him Mr. Read may begin to count his minority over again.

We said in the outset that the farmers have lost heart and have no faith in the new Parliament; but Mr. Read now explains how he has been, if not openly, still quietly furthering the interests of agriculture by "losing no opportunity of insisting that compensation to tenants for unexhausted improvements ought to be embraced in a measure next session." But Mr. Read says more than this, and on Friday, just when Lord Fortescue and the Devoushire Chamber were fiddling over freedom of contract, Mr. Sewell Reid, as something of a corollary on what he himself had been trying to do while in office, told his constituents in Norfolk that "Her Majesty's Government is quite prepared to do justice to the tenant-farmers of England." Coming from such a quarter these are memorable words, affording the promise they do that the tenant-farmer member may still be able to fulfil his mission; although it is already sufficiently palpable that the principle of the 12th clause will be his great difficulty.

THE LATE MR. SAMUEL DRUCE.—At the general meeting of the Oxfordshire Agricultural Society the president, Lord Jersey, proposed the following resolution, which was carried unanimously: "That the Society expresses its deep regret at the loss by death during the past year of Mr. Samuel Druce, who had long been an active member and exhibitor, and begs to offer its sincere condolence to Mrs. Druce on the bereavement she has sustained."

SUCCESS TO AGRICULTURE.

SUCCESS TO AGRICULTURE! The noble chairman or some honourable gentleman has of late been giving this nearly all over the country as one of the toasts of the evening. Not, however, that much has often come of it. The interests of all are identical, and the best thing to do will be to go on pretty much as we have been, relying on and encouraging the mutual good feeling between landlord and tenant and tenant and labourer. Thus, at Braxted the other day Colonel Brise declared "the three must sink or swim together;" and, further, that it would never do for the farmers to go and complain how "in the present state of farming we only get a very precarious livelihood." But here is one of the most awkward facts of the present state, or of going on as we have gone. If agriculture is to advance, under the present state of things the enterprising tenant is in a most *precarious* condition, as there is no other word for it than that which Colonel Brise employs. If he spends his money freely, often enough, perhaps, in doing that which was more a duty of the owner than of the occupier, the farmer does not know whether he shall have the time or the right to see his own again. And yet an agricultural member would not be inclined to make any alteration in this present state of farming. For two reasons Colonel Brise would certainly not support any measure which would enable owners and heirs to entailed estates to raise money for farming: "In the first place I have much too great respect for the British farmer—I look upon him as the backbone of the country; and, in the second place, I have too much sympathy with owners and heirs of entailed estates; and, moreover, I am quite sure that if they ventured their money on farming the heirs would never see anything of it again." These two reasons are virtually one, the assumption being that if a landowner raised money for improving, that is, for putting his estate in a better condition for cultivation, he must take to farming it himself. This is, so far as we remember, the first time we ever knew the question put in such a way, as it is certainly not the general opinion of what should be sought or follow from any amendment in the law of entail. If the owner were permitted to grant more and do more, this privilege would naturally prove mutually advantageous to himself and his tenants, as they would make more of the property, and he in due course have a better rent-roll. Or, if we even confine any better state of things to that which would affect only the landlord himself, we may say with a Hereford correspondent of last week, "I never go into Radnorshire without thinking that a Landlord-Right is as much wanted as a Tenant-Right. The sides of the hills that are too steep to cultivate would carry larch trees to an enormous amount; but how can limited owners go to the expense of planting them when they would all go to the heir-at-law?" Will Colonel Brise ponder over this query? that is, if he should not have so strong a sympathy with owners and heirs of entailed estates as to prevent him, as a member of the House of Commons, supporting any measure which would give these gentlemen larger incomes.

SUCCESS TO AGRICULTURE! "The interest of the tenant was bound up in that of the landlord." This is not very definite, although liberally interpreted it may perhaps be made to stand good for Tenant-Right, the adjustment of the Game evil, and so forth. But just when Colonel Brise was saying so much in Essex a tenant, who was leaving his occupation in the neighbouring county of Suffolk, said

at his sale luncheon, distinguishing the employer's and the labourers' interest from that of the landlord, how "They all knew very well that if a thousand acres were cultivated by one man, he would employ more labour than six men farming the same extent of land. Therefore, it was to the capitalist that the labourer would have to look for the improvement of his condition; and he did not think the labourers would get that improvement unless they got some one to represent them in Parliament who would give them a just Tenant-Right Bill. He did not leave the farm with the slightest amount of regret. He had only been there six years it is true, but they had been six years of annoyance, because he had not been able to get on well with his landlord. He went on four or five years and put up with a very great deal; at last his landlord so grossly insulted him that he told him it would be best for them to cease their relationship as landlord and tenant. If he had been in the position of some tenants he should have had to leave the farm at a very great sacrifice, but his professional ability enabled him to take care of himself, and he had done it." Somehow or other this does not run very well with that identity of interest and mutual good feeling of which we hear so much as touching on the toast of the evening.

SUCCESS TO AGRICULTURE! At this same Braxted dinner, where they talked about everything in a mild pleasant sort of way, from Mr. Mechi and his balance-sheet to compulsory education, another county member, Mr. Round, spoke to the great satisfaction with which every occupier and householder would regard what the present Government had done over local taxation. Mr. Round says nothing as to the landlord's satisfaction, although many people are apt to regard the movement over local taxation as far more a landlord's business than that of an occupier, being, as it is, mainly a matter of adjustment between rates and rent. Still, if Mr. Round be really in earnest as to what the occupier, or, in other words, the farmer, is to gather from this pet movement on the part of the County Party, he would do well to study this extract from a letter in *The Salisbury Journal* on the "unequal incidence," as the honourable gentleman himself phrases it, between the taxation of landlord and tenant: "Let a calculation, in round figures, be made of the comparative taxation of the tenant and of the landlord respectively, on the devolution of properties from, say, parent to child, on the death of the former. In regard to the tenant-farmer's stock there would be on intestacy £75 administration and £25 legacy duty—i. e., £100 to be immediately provided, or at the rate of 4 per cent. In regard to the estate, succession duty, payable only by half-yearly instalments of about £6 for eight half-years, commencing one year after the right of the successor to possession, making a total of about £48, or at the rate of something like nine shillings and sixpence per cent.; assuming the succession to devolve on the average of the four ages of 25, 35, 45, and 55, at which the estate would be respectively valued as an annuity worth 17, 16, 14, and 11 years' purchase, giving an average of 14½ years' purchase, say £4,857, on which, at one per cent., the duty is, say, £48 10s. These ages are merely given as being those at which a succession might be fairly assumed as most likely to take place. Here, then, we have tenant-farmers taxed on their stock devolving from parent to child in case of intestacy, at about double for property worth one-quarter, or, in short, at about eight times the rate per cent. charged to the landowner." And so forth. Of course something of this has been heard of before; but

as it seems to us, if the agitation over local taxation be really anything more than a landlords' cry, the "unequal incidence" between the two classes should be amongst the

first things looked into, more especially as the injustice could be remedied at little inconvenience. If people will talk farmers' politics they should talk them out.

P R I Z E F A R M I N G.

Seldom is it that the caricaturist points his pencil at the pursuits of agriculture; or, if so, his aim is still, as often as not, taken after the good old flint-and-steel fashion: a stout gentleman in a superfine blue coat, white cords, and top-boots, is sketched as the British farmer of 'seventy-four going about his business. Whereas we have got far beyond any such an era in the annals of the art, and were we called on to suggest a subject it might be something of this kind: a stranger in a lack-fly come to a stand-still on a bad woolly road, by the side of a gate-way wanting a post, and with a rough, untrimmed hedge blocking out the view. In his difficulty the visitor asks of an intelligent youth whether they are going right for the prize farm? "Why this *oe* the R'yal prize farm," replies the crow-keeper; "you jist stan' up in your carriage and you can see it—there, where that 'ere broken-backed hay-rick be blazing away like fun!" A print of this pattern would sell, say in Bedfordshire, or it might very fitly appear as an illustration to the next number of the Royal Agricultural Society's *Journal*. Prize-farming, in fact, is fast becoming the feature of the day, as no movement promises to be more serviceable, especially when the awards are accompanied by full and able reports; and no report will be looked to with more interest than that in which the Bedfordshire judges will show the grounds upon which they arrived at their conclusions. There are people who have maintained from the first that these decisions were based upon wrong principles; that the views taken of what really prize farming should be at this time of day were narrow and small; that it is not the man who can hold the most corn who is doing the best by the land, and so forth—points which no doubt the judges will take up in turn, and so soothedown the dismay of that Wednesday morning's deputation as they bumped over the roads, admired the blooming thistles, and scented from afar off the heated haystack.

There has lately been issued a report on the prize-farming of the Banffshire Agricultural Society—a report which for fidelity is something of a photograph, or, perhaps more properly, an inventory. The home-steads are entered with all the minutiae of a sale catalogue, and every operation on the farm is as carefully posted up; there is not much criticism attempted or comparison drawn, but a deal of information is conveyed on the authority of an official investigation as to the best systems of farming in a very adventurous part of Scotland. Turning to another remote part of the United Kingdom we have in this day's number got together a deal of talk on the farming of Wales, headed as this is by a report on the prize-farms of Denbighshire and Flintshire. And the inspector, as the single judge is termed, has done his work well; for brief though as is the story of his travels, it abounds with useful matter in the way of information and example. Thus, on a model Welsh farm, house-feeding is very largely followed; no hay or straw is sold; all field work, either by horses or hand, is done by piece, as a bonus is given for rearing lambs and poultry. And here the inspector intervenes with an emphatic commentary: "This system is worthy of more thought from farmers than it yet obtains. Wherever it can be applied it must be the fairest way of rewarding skill and industry in the labourer, and of stimulating and sustaining him in his efforts to rise both socially and

morally, and by adopting it the farmer must get equal value in labour for his wages, and have his work done more quickly and equally well, with proper supervision. Major Hughes says the plan works admirably." Here, again, is something of what the small farmers in Wales are doing, as testified by Mr. Rigby: "One has eradicated 1,850 yards of old fences on a farm of 227 acres, and has reclaimed upwards of five acres of land by grubbing up tree-roots and filling up ditches, and has planted 628 yards of new fences. Another, on a farm of 200 acres, has done even more work of a similar character, and has also made a new road of considerable length, re-formed a stackyard at great cost to reduce labour, built a stoue wall 100 yards long, and expended a considerable sum on improvement of farm-house. A third has gutted his farm of all its old fences, re-formed its fields into the most suitable size for convenience by planting nearly 6½ miles of new fences, his landlord giving quicks and providing substantial rail fences for their protection." They have trimmed their fences, made new roads, improved the farm-houses, and reformed the stack-yards. Why these same small Welsh farmers, though they did not win prizes, might fairly offer example to the crack farmers of Bedfordshire, provided only that they took care to make the stack-yards fire-proof. Then, they have good implements, have planted steam engines, use artificials, and "one of the best fields of wheat I have seen this year." Bravo, Cymro! But at Ruthin the prize agreement scarcely runs up to this form—as for some reason or other a prize agreement is seldom worth much—and this is studded with such big blots as a six-month's notice, a clause compelling the tenant to do so many days' carting for his landlord in proportion to the rent paid, and other such obsolete enactments, which no judge should pass in a prize paper.

Turning again to the North we give the inspectors' report as just published, on the prize farming of Westmoreland and Kendal, wherein the judges boldly declare that some "enterprising and industrious tenants appear to receive too little encouragement from their landlords, and had at their own cost effected what are really landlord's improvements." They speak further to the excellence of the permanent grass land; and, on the other side, of their "surprise at finding in various parts of the district considerable tracts of wet boggy land still unreclaimed, but which by drainage and judicious dressing might be turned at comparatively little cost into valuable stock-rearing land." On only the day previous to the date of this report Mr. Rothschild referred at Aylesbury to "the loose statements about waste lands," and how "these waste lands were said to be held by the landlords and kept out of cultivation for their own purposes." At any rate there is clearly a deal of waste land in Westmoreland; while a nobleman has just become the tenant of a farm of between two and three thousand acres in Suffolk—not exactly waste land, entirely for his "own purposes"—that is, the preservation of game. By the way, the award of some prizes for farms has been made during the week in that same game-ridden county of Suffolk, but no report was presented, and the conditions are objectionable, as a man must win three times over before he can receive any tangible reward. Under such a system as this the thing would soon wear itself

out; whereas, with handsome premiums readily paid over, there is nothing promises to work better or to do more to spread information and advance agriculture

than the principle of prize-farming, which, if not introduced, has been brought so prominently into notice by the Royal Agricultural Society.

AUXILIARY FOODS.

BY THE NORTHERN FARMER.

No. 1.

The word auxiliary, when used in reference to food for live stock, is a most comprehensive term, embracing, as it does, first of all, a considerable variety of crops grown on the farm, and for the most part highly forced, so as to secure as large a quantity as possible of rich succulent food; thus aiding the pastures and enabling the farmer to keep a heavy stock of animals, and yet have an extensive breadth of corn every year. Under an enlightened and liberal system of husbandry, such crops are not permitted to interfere with the fixed course of cropping carried out on the farm, but are grown wholly during the period which elapses from the clearing of the corn crops in autumn and the preparatory operations for turnip-sowing in the ensuing spring and early summer. By liberal treatment in the application of stimulating manures, a vigorous growth is induced, and an enormous quantity of food is obtained from land which would otherwise have been fallow. The plants being cut in any case before seeding, the resources of the soil are not in the slightest degree impaired, and the standard crop of the rotation which succeeds as the land is cleared is actually benefited, if the cultural operations have been carefully attended to. Crops thus grown are strictly supplementary, and are principally used in the house for a morning and evening feed; as, for instance, with dairy stock, in sheds or yards with store cattle, or simply thrown on the pastures, to be consumed by the general stock of the farm. Food used in this way tends largely to forward the interests and material prosperity of the farmer, his animals being improved in condition and amount of produce, his fields are continually top-dressed with substantial manure, and the home supply of the latter becomes after a few years so abundant as in a great measure to preclude the necessity of purchasing bulky manures, the mere saving in the expense of carriage being an item well worth looking after. The latter becomes distinctly noticeable in about five years if auxiliary crops have been extensively and regularly grown, and every known method of fertilising the soil persisted in during that time. It is of course premised that the farmer possesses sufficient capital for the extent of his holding, and that he has the spirit to spend it, and is protected by liberal covenants in so doing, either of these qualifications absent, the most absorbing enthusiasm, combined with the most slavish industry on his part, will fail to command success. In the catalogue of auxiliary foods available to the farmer, there is also included a large number of feeding substances in a concentrated form, consisting principally of oleaginous cakes, specially manufactured for stock-feeding purposes, immense quantities of the various kinds being imported ready for use, the seeds also being imported and crushed in England. Thus the farmer may purchase Canadian cake, as manufactured in Canada, and shipped to this country ready for distribution to the consumer. East Indian unseed-cake is another well-known designation; this cake not however, as its name might seem to imply, being imported in the form it reaches the farmer, the seeds only coming direct from the country of their growth, and afterwards manufactured in the United States, England, and several other countries. Decorticated cotton-cake,

another excellent feeding substance, is solely prepared in New Orleans, and largely imported into Great Britain of late years, while the undecorticated is made in England from American, Egyptian, and Indian seeds. The whole of these substances, which at the present day exercise such an all-important influence on the prosperity of cattle-feeders, and which are brought into this country in such immense quantities, very seldom reach the farmer direct from the importer, but mostly through the local cake and manure merchant, these branches of business being usually combined. The cattle-feeder, though thus taxed with an intermediate profit, is, nevertheless, greatly benefited, as he is enabled to get his cake in quantities to suit his requirements at regular intervals throughout the season, and so have it always fresh, a point of some importance with such an expensive article, as it is highly susceptible of injury by exposure to damp, and in large quantities requires considerable space for storage. Large consumers, who can calculate pretty closely to the quantity they will require throughout the season, have it in their power to cut the intermediate profit very low indeed, as the merchant will be only too glad to have the orders of his clients placed early, so that he may secure him-self and be able at the proper season to contract with the importer or manufacturer for a full supply. By this arrangement all parties are largely benefited—the shipper, the wholesale merchant, and consumer, and all knowing what they are about, can carry on their business with a feeling of confidence and security which no ordinary fluctuation in the value of feeding-stuffs is able to disturb. Of course such a comprehensive arrangement, in which important interests and large sums of money are involved, can only be carried out by the almost unanimous consent of the farmers themselves, all the other parties being simply engaged in supplying their wants, carrying out their instructions, and receiving their cash. As an inducement to give an early estimate of the amount of cake feeders are likely to require, it will be invariably found that the dealer will cut his profit on the transaction down to the lowest possible point at which it is worth while to place the order on his books, contracting for the entire season, and offering every accommodation necessary in the way of storage, and delivery in convenient quantities at stated periods. These remarks are not by any means merely theoretical, but are based on the commercial transactions of no more distant period than the past feeding season, during which time many agriculturists who are large consumers lost considerable sums of money by omitting to contract for a full supply of cake at the commencement of the season, when it was as low in price as could reasonably be expected. In the single instance of cotton-seed cake, one of the most useful and generally popular feeding-stuffs of the present day, a rise as sudden as unexpected took place in the very middle of the season, when it could scarcely either be done without or economised, without excessive inconvenience. The increase in price under the most favourable conditions was one-fourth, rising occasionally to one-half, when stocks became low, and from various causes were dilficult to replace. The position of those who had the forethought to contract contrasted most

favourably with that of others who merely took chance, although their necessities were quite as urgent, as they not only had to pay from 25 to 50 per cent. extra for the cake they used, but had actually to wait until those were served who were getting it on much lower terms. The time is now near at hand when cake will be required most probably in very large quantity, to supplement what, even under the most favourable conditions as to weather for the remainder of the growing season, can only be but a moderate root-crop, and purchasers, profiting by the experience of the past winter and spring, will do well to make early arrangements for a continuous supply throughout the season, on as moderate terms as

the tone of the market for the time being will permit, adding always the cost of carriage, as item the consumer can never get rid of under whatever name it may be disguised. No difficulty need be ever experienced in arranging this highly important business-matter satisfactorily, as in every district respectable merchants, able and willing to carry out their engagements, no matter what turn the markets may take, will be found eager to compete with each other, voluntarily offering a guaranteed article at the lowest possible cash price at which it can be supplied. A continuous supply at a fixed price being thus secured for the season, the extensive feeder is saved a vast amount of inconvenience and pecuniary loss.

HIGHWAY LEGISLATION.

At the Norfolk Chamber of Agriculture's Meeting, in Norwich, a resolution to the following effect was proposed: "That in any future alteration in the management of highways it is expedient that a county committee should decide which roads should be *county roads*, and that the expense of the maintenance of these should be mainly borne by the county rate."

Mr. C. S. READ, M. P., speaking in support of the resolution, said it would be quite possible for a committee or the county authority to say which were the roads used by the general public and had thoroughfare traffic as to entitle them to have a certain portion of the expense of maintenance borne by the county rate. It would be of the greatest advantage to the public, and to the various districts through which thoroughfare roads pass, to have those roads kept in good repair. What few turnpike debts there were now were tiling, but they must be got rid of somehow. The bondholders he believed received very little, and consequently their property must be worth little. At the same time they must be appraised, and the amount paid by somebody. He did not suppose that any proposal to pay off the debt out of the Consolidated Fund would ever be carried into effect; but if they were taken over as county roads a portion of the money would have to be paid by the county and the tolls abolished. No doubt in some parishes the hardship was greater than in others. Where there were two large and populous towns with a great deal of through traffic which railroads would never entirely divert, there the roads were frequently in a bad state; and certainly the expense put upon the parish was altogether disproportionate to the benefit derived. What benefit did a parish derive from having a turnpike road running through it double the width required for its local traffic, and certainly maintained as hitherto managed at double the expense of the ordinary roads of the country? The old system of tolls was really about the right one, namely, that those who used the roads should pay for them; but then it was very inconvenient, and consequently unpopular to be stopped on a cold morning to get out threepence, and it was even much more disagreeable on a dark night. But as it appeared to be the opinion of Parliament that turnpikes should be done away with, then came the question, How were the roads to be kept in the best possible repair? He saw no other way of doing it so economically and so well as by the course suggested in the resolution. He had been glad to hear the mover (Mr. K. T. Gurdon) say he was in favour of county boards. He did not think they would ever get any real reform in or improvement of the system of local taxation unless they had good county boards—boards altogether apart from the quarter sessions, for he had no wish that they should interfere with the functions of the magistrates. There would be plenty left for the magistrates to do. They would have to administer justice, manage the goals, and have charge of the police, half the cost of which was now paid by the Government. The county boards might manage matters relating to bridges, lunatics, weights and measures, they might have jurisdiction under the Health Act, and of course they would under the Contagious Diseases (Animals) Act, and why should they not have a few roads to look after? He hoped that though some might be a little bitten by any alteration they would allow the resolution to pass.

The resolution having been carried by 25 to 5, another

motion was made as follows: "That the rest of the highways should continue to be managed by parochial surveyors, power being conferred upon some county official to enforce the proper maintenance of the roads when the parish neglects to repair them."

Mr. C. S. READ also advocated this resolution, saying that the Highway Act of William IV., like a great many other Acts, had failed principally because there were no public prosecutors in this country. This resolution wished to put the Act in force. It was not a pleasant thing to indict one's neighbour, and that was the only way a parish could be brought to book under the Act. The resolution suggested that there should be some county official who should be a sort of referee. One such official would be sufficient for the purpose. He would in all probability be a man who would have to look after the great arterial roads, and consequently he would be competent to advise and instruct the parochial surveyors, who perhaps did not altogether know their duty, and who when they knew it were sometimes not quite willing to perform it.

This resolution was also adopted.

At a meeting of the Essex Chamber of Agriculture, at Chelmsford, Mr. J. S. Gardiner brought before the Chamber the series of questions on Highway Legislation, received from the Central Chamber, and after some conversation, in the course of which a number of propositions and counter-propositions were brought forward, the Chamber decided on transmitting the following answers: Question 1. Yes. 2. Yes. 3. Two; county roads and parochial roads. 4. All roads, whether parochial or otherwise should be maintained, half from the Consolidated Fund and half by the parishes. 5. The governing body of all the roads in the county should be an elected County Financial Board.

At a meeting of the Leicestershire Chamber of Agriculture a number of answers from the special committee to questions submitted by the Central Chamber on the subject of highway legislation were received and discussed, and a proposition was carried, after some discussion, that it was desirable to reorganise the system of highway management in so far as making the district system compulsory, and to include the whole management of the turnpikes by the district highway boards. It was further resolved that the fund for the maintenance of the roads be derived from the common fund of the highway district; that there should be only one class of roads established under the new system; and that highway boards should constitute the governing body. The following were the replies to the answers to the first and third questions. 3. Two. 4. As at present for the highway, but all roads that have been turnpikes should be assisted to the amount of one-half of the expense of repairs from the Consolidated Funds, and the other half from the common fund of the highway district. 5. Highway Boards.

At a special meeting of the Nottinghamshire Chamber of Agriculture, Mr. G. Storer, M.P., said that the first

question from the Central Chamber was somewhat ambiguous, because there existed two systems with regard to the management of our roads—the old parochial system, and the new system of having highway boards. As far as this county was concerned the new system worked well, though he was aware that it was not so satisfactory in some districts as in others. He thought they could hardly give a categorical answer to the question without distinguishing between the new and the old systems, but he was in favour of maintaining the new system, which he thought ought to be made compulsory all over the country. He was of opinion that permissive plans were not satisfactory, and that they did not generally work well. The general feeling of the Chamber was in favour of a reorganisation of the road system, and it was decided to answer the first and second questions affirmatively. With reference to the other questions, the Chamber was of opinion that at least two different classes of roads should be established under a new system; that three-fourths of the expenses of the turnpikes should be paid out of the Consolidated Fund, and that other roads should be supported out of local rates; and, as to the last question, the meeting thought that the whole should be managed by district boards, subject to a Government inspection of the roads to which they contributed part of the cost of maintenance.

At a meeting of the Cambridgeshire Chamber of Agriculture, Mr. Rodwell, M.P. said the present permissive act with regard to highways was inoperative and unsatisfactory. He agreed with the principle that every parish should maintain its own roads; but, at the same time, some elasticity was required to meet hardships, in exceptional cases, and some form of classification would not be objectionable.

At a meeting of the Peterborough Chamber of Agriculture, a resolution from the chairman, Mr. Wells, in favour of Highway Boards, was put and carried. It was further agreed that a re-classification of roads was necessary; that there should be three classes of roads; that turnpike roads should be maintained out of the Consolidated Fund, and ordinary roads by a district rate; and that district highway boards would be the best form of management.

At a meeting of the East Suffolk Chamber of Agriculture, at Ipswich, Lord HENRIKER, in the chair, explained that they were met to consider a communication which had been received from the Central Chamber of Agriculture. This was the first meeting that had been held this year, but he was one of those who thought that a society of this kind should not create a subject for discussion. He had always held that opinion, and when he was President some years since, he thought it his duty to do as he had done this year, to recommend that they should only meet when there was anything important which it was worth the while of the Chamber to discuss. It was far wiser that they should keep their organisation together in a healthy state, so that when it was required to discuss an important subject, that organisation would be available for the purpose. He felt that it was a great pity to meet and have an empty discussion, and he believed that a great many members of the Council agreed with him in that opinion. It was not really from the fact that there was a paucity of subjects to discuss that they had not been able to meet this year, but he observed that other Chambers had followed their example, and had not held discussion meetings. The fact of the matter was, the present Government came into power in the middle of the Session as it were, without having time to consider any measures they were going to bring forward, and he considered it most likely that everybody had been waiting to see what measures the Government would propose in the next Session. With regard to the particular subject which they had met to consider to-day, they were, perhaps, in the same position; but it had been stated on one or two public occasions that the Government would probably bring in a measure next year; and if this Chamber could have a fair discussion upon the subject, and could generally answer the questions which were put by the Central Chamber, he thought it might be of service in bringing the matter under the notice of the Government, showing the importance of it, and how strong a feeling existed in reference to it. A road measure had been promised year after year by the House of Commons, but something or other had always come in the way to pre-

vent its being brought forward, and this year, again, it appeared that there might be several measures which might be likely to come in the way of any road measure, and possibly they were no nearer than ever they were to having such a measure brought forward. Undoubtedly one of the most important local subjects was that of Local Taxation, and he felt that this subject had an important bearing on the settlement of that question. And if a certain number of Chambers could answer the question generally in a satisfactory manner, it would tend to show that there was a strong feeling that some measure should be passed, making an alteration in the system of road management, and it would have some effect in inducing the Government to consider this question. For that reason it would be generally felt that the Central Chamber had taken a wise course in the action it had adopted. The questions they had to consider were these:

1. Is an entire reorganisation of our road system in England, including the management and maintenance of turnpikes and highways, desirable?
2. Is a re-classification of all roads needed?
3. How many different classes of roads should be established under a new system?
4. How should the funds be raised, and from what sources, for the maintenance of each class of road?
5. What should be the constitution of the governing body of the whole, or of any one class of roads?

Possibly there would be a great difference of opinion on these different questions asked them by the Central Chamber, but probably there would be a general feeling amongst all the Chambers in favour of legislation on the subject, in fact saying that legislation was necessary. The present management of roads in many parts of England was felt to be a great grievance, especially in the North of England, and even also in our rural districts, particularly where turnpike trusts had been done away. Some turnpike trusts were thrown upon the parishes, and others were thrown upon the districts; and some of the old turnpikes were used for main roads, whilst others were only used for the parish roads, but even where they were only useful for the latter purpose, the parish was compelled by law to keep up these old turnpike roads to the original width, although they might be a great deal wider than were actually required. In the North of England there was a great deal of mineral traffic passing through the rural parishes from and to towns which did not contribute to the maintenance of the road, though they had the benefit of the traffic thereon. It sometimes happened that a parish was keeping up a turnpike road which was out of debt, the trust being abolished, but the ratepayers had to go but a few miles before they were on their neighbours' roads where a toll existed, and though they provided a free road for their neighbours they could not travel far without having to enter a parish where there was a debt and toll still existing. He was a member of the Committee on Roads in the House of Commons for several years, and they considered the subject very carefully indeed, and came to the unanimous opinion that an alteration was required, that a re-classification of roads was necessary, and also that the burdens should be more equally distributed according to the class of roads to be dealt with. No doubt some persons might wish to go back to the old parochial system. This might be possible in some counties, and in some parts of our own county it might work very well, but in other parts of England it would be almost impossible, particularly in the North of England, where with the heavy mineral and coal traffic, such a system would be a great injustice, and he thought it would be found, when the matter was looked into carefully, that it would not be wise in all cases to go into the parochial system. If they were agreed that alteration was necessary in the management of the roads, then the question arose as to how to carry it out. There was one plan that had been often discussed, and discussed with some reason because it was a simple one to carry into effect, and it was this: The turnpike roads, and all roads leading to stations, roads between great towns, and those which were the main arteries of communication should be placed upon the county rate, aided, if possible, by a Government grant; and that all the other roads should be placed upon a district rate, a small district probably taking the Highway Act as the basis, altering it in some respects, for it did require some alteration, particularly with regard to supervision of labour, which might be improved if properly considered. There were a great many other plans which might be sug-

gested; but this one had been generally discussed, and had the merit of being a simple and easy one. Then we come to the question as to the authority to carry out the management of these roads. As regarded the district, there would be a District Board, and as regarded the county, it would have to be some county authority; perhaps the magistrates at quarter sessions, or perhaps a county financial board committee. He did not anticipate, however, that there would be any difficulty in that respect. He sincerely hoped one thing, and it was this, that as regarded the parochial roads, they would not be placed under a central authority, because he thought those who lived in the district were much better able to manage and keep a road in repair than a central authority could possibly be. One thing was quite certain, and that was they needed uniformity. It sometimes happened that in one district the roads were mostly good, and in the next they were very bad; and there ought to be some uniform system of management, for in a country like this, where we ought to manage our affairs properly, we should have some uniform system by which to make up the roads equally good all over the country. With these few remarks he would ask gentlemen present to give their opinions, so that satisfactory answers might be sent to the questions put by the Local Government Board.

Mr. WILLIAM GURDON contended that the roads were used to a great extent by those who lived in the locality, and he thought they ought to be managed by those who lived in the immediate neighbourhood of them. He observed that the abolition of the turnpikes threw the whole thing into disorder, and said the question was what was to be the system for dealing with the roads in the future. Was it to be a centralising system? We should hardly in the present day ask the Government to keep up the roads as they used to do in France. He was quite sure it would add greatly to the expense of the country. He felt that at his time of life he should never see any change. In the Western Division of the county the Highway Board system had been tried, and it had not been altogether unsuccessful, because, he observed, with respect to the Lavenham Board, that monstrous as was the district, they had been enabled to save over £1,000, and he was sorry to say that at the meeting at which this fact was stated, it was decided to dissolve the Board. This was certainly not very encouraging. The plan of the Rev. Mr. Cox, a clergyman in Essex, who had taken great interest in this matter was to have a road inspector. This was no new thing, but he (Mr. Gurdon) thought there were few gentlemen present who would like an inspector to come into their parishes and find fault with the work which they had done. Let them consider the whole question carefully, and possibly after all they might come to the conclusion that it was their duty to attend to their own roads; that they could keep them up cheaper than any other body, because they had the requisite knowledge, and the opportunities of putting the materials on to the roads at the most suitable time; and that it was their concern to have their own parish roads in as good a state as possible. He should like gentlemen to come and see the 1,200 yards of road he had by the side of his farm which he made himself. It was a fact that this cost less for mending than the other roads in the parish, and he had this proof that the system of making a good road was the cheaper plan.

Mr. H. COOPER (Holton) was strongly against the Highway Board system. He imagined that those who had adopted that system were now anxious to get rid of it, because they found it much more costly. A person must be better able to attend to the roads of the parish in which he resided than another who resided some distance off, and who had a large district to attend to. In his district the roads generally were in a very good state, and for his own part he did not see any necessity for any alteration in the present system. He thought if all the parishes in the district embraced by one of the Highway Boards were polled there would be found a large majority in favour of a dissolution of the Board.

Mr. R. L. EVERETT said that the inequality with which the roads in the different parishes were kept up was a glaring anomaly. There were plenty of instances of there being as good roads as could be desired in one parish, but if you went into another you found them very bad. If the present system was to be continued it was necessary that there should be an inspector or some one to force all the parishes to do their duty; and then he thought with Mr. Cooper that there was no cheaper way of mending the roads than under the parochial system. There were roads which had a town at

each end, and it did seem hard that the residents in a parish through which the road passed should have to pay the cost of the wear and tear of the traffic by which they were benefited but a very little. He thought the turnpike system had its advantage, but the feeling of the country was decidedly against them. He should be inclined to answer the questions put by the Central Chamber in the affirmative, that the charges should be divided, that the roads which were main thoroughfares should be paid for on a different basis to those which were parochial roads, and used entirely by those who lived in the neighbourhood.

Mr. J. A. HEMPSON said there was a very great question as to whether this Chamber would be able to fall in with the resolutions in the form in which they were put by the Central Chamber. At the same time it was a large and important question, and turnpikes and common roads appeared now to be reduced to the same level. As to the main roads between two great towns, it must be remembered that there was hardly a town, of any importance, which had not a railway connected with it, and this had the effect of very greatly reducing the traffic on the roads. He did not see how, unless they upset the whole system by putting the whole thing under a Government Department, how it was possible to better the present parochial system. There were, no doubt, exceptions with regard to districts in the North, and there were much the same grievances in some of our districts. There was a great deal of traffic in some cases from a considerable neighbourhood to some of the country railway stations, and the parish in the immediate neighbourhood had to bear all the expense of keeping up the road. For some time he had observed that comparisons had been drawn between town and country expenses. It was said that the towns-people used the roads extensively, and did not pay towards keeping them up; but it must be borne in mind that people who lived in towns had to pay the paving and lighting rate, and heavy expenses for keeping up the roads, which country people when they came to the towns had the full benefit of. He thought, therefore, the towns and the country parishes might fairly cry quits over the matter. He thought the question would arise before long as to whether the whole traffic of the country should not be brought under a Government department. This was a subject that would be the strong question of the day before long. He referred to the railways and the traffic of the country generally. He asked whether the management of the railways was satisfactory, and, referring to the late Thorpe accident, said it would have been impossible for that accident to have occurred had the railways been under Government control, because they would not have tolerated a single line.

Mr. F. S. CORRANCE remarked that the opening sentences of the noble Lord reminded him that they had in this matter a very old grievance. It brought his mind back to the time when he and the noble Lord deshed their maiden swords in the House of Commons. The noble Lord was appointed on a Highway Committee, and he (Mr. Corrance) knew no one better able than his Lordship to give advice on the subject now under consideration. Mr. Corrance then proceeded to remark that there were signs that this subject was likely to become a new grievance, that was to say the House of Commons was going to meddle with it. He could not help thinking of what the House of Commons had done in recent times, and of the measure which was successfully passed through the House of Commons and which he did his best to resist. The matter had been followed up by one party and the other, and we had always been getting nearer to an issue which was to the disadvantage of the ratepayers. He never approved of Highway Boards, and he thought the experience he had had of them proved that there was some reason to justify his dislike. He disliked the divided responsibility of the Board, which, he said, was formed on an area of its own which was not contentious with any other authority. The highway-rate itself he characterised as an anomaly. The formation of these Boards facilitated the transfer of the new obligations which were thrust upon the parishes by the abolition of the turnpikes. As to the questions now submitted by the Central Chamber of Agriculture; with reference to the first, he should like to know in what direction there was to be an entire re-organisation. If by expressing any such opinion as that embodied in the first of the list of resolutions read by the noble chairman they were going to help Her Majesty's Government, to bring the parishes into further difficulties, then all he could say was

he would give a most decided negative to any such proposition. As to the second question, "Is a re-classification of all roads needed?" he should not so much object to that. He thought that the turnpikes ought properly to be thrown upon the counties or county-rate, and that there should be a proper revision of the rate in its present objectionable form. Then with regard to the third question, he did not object to bringing the parochial roads under a Board of Guardians, with a properly constituted committee. As to how the funds should be raised, he thought a county-rate ought to be one fund, and as to the other the present highway-rate, it was one of those things which if there was to be anything like a satisfactory settlement must be wholly revised, and it was one of those things which would tax the capacity of a great many of our legislators. In regard to the last question, as to what should be the constitution of the governing body, his answer would be a decided negative—namely, not a highway board under any possible circumstances.

Mr. HERMAN BIDDELL said that as his term of office as representative of this Chamber at the Central Chamber would not have expired at the meeting when these questions would be fully discussed, he hoped they would be induced to return direct answers to them, but not necessarily unqualified answers. The subject was here discussed from a general point of view, which he found was the course adopted by the majority of the Chambers of Agriculture. The subject had been brought before the Central Chamber more than once during the present year. The gentleman who had written to this Chamber brought this matter before the Chamber last year in London. He had some idea of inducing the Government to turn over to the road-rate fund certain of the assessed taxes raised in the district in the same manner that the house-tax was about to be appropriated to certain local funds by Mr. Goschen, in a measure brought forward some years ago, but the rapid changes that took place in our financial business before the measure was brought forward, engulfed some of the funds which Mr. Muntz had shadowed forth as the source of the future road-rate. Riding-horses kept in the neighbourhood was one of the things named, but before he had fully matured his plan the Chancellor of the Exchequer had taken away some of the taxes which were least expected to be taken, and left others which it was fully expected would be removed, and thus opposed Mr. Muntz's idea. He (Mr. Biddell) could not of course say what was his present idea as to the substitution of a road-rate. He expected they would hardly get the Government grant, and thought that Government grants for this sort of thing were likely to be closed for some time to come. He believed it would be found if a man were stationed at Bourne Bridge or Handford Bridge to inquire of passengers that though they mostly came from the neighbourhood, not one in ten contributed towards the keeping-up of the road they were using. He did not see how this was to be remedied unless the whole system was attacked, which would be a tremendous undertaking. They at present paid for the roads from the same source as they paid for the maintenance of the poor. It would require a very large effort to relieve them of that, but in very many districts an enormous charge had been added to this for doing away with turnpikes. He (Mr. Biddell) was not in any way affected by the abrogation of the turnpike trust, but several of his neighbours were. As occupiers having a long lease, and a long piece of turnpike constantly draining upon them, they were used very hardly. He need only go to the parish of Kesgrave, where, as he held no land, he was qualified to speak disinterestedly. Those who lived in the parish considered they would never be called upon to contribute to a road rate, being, as they believed, under a permanent system, endorsed by the Government as legal and right. The Act, however, allowed the Trustees to throw up the road, and the occupiers were, therefore, immediately saddled with the entire expense of this road through the parish. He contended that notice ought previously to have been given to these occupiers that at such and such a time the roads would be thrown upon the district. These matters that he had mentioned were grievances, but they need not upset the whole road system in England. They must look very carefully into the matter before giving an answer to the first question. He asked the Chairman to put these questions to the meeting *seriatim*, so that they might have a definite answer to give to the Central Chamber.

Mr. CORRANCE said that he did not like the idea of reconstruction, and until he knew in what direction they might look

for the effects of such a measure, he should be very chary in giving an opinion.

The PRESIDENT said that before putting the question he must say that he could not agree with Mr. Biddell. He was unwilling at present to see any reconstruction or any rearrangement of the rates.

Mr. BIDDELL: What I meant was that I should look very closely indeed before doing it.

The PRESIDENT said that if Mr. Biddell had heard all the evidence that he had heard upon the subject, and the difficulties that people in other parts of the country had got into, he (Lord Henniker) thought that he would agree that the grievance to this particular parish of throwing the turnpike upon the parish was nothing compared with that suffered in the very populous districts. It had become really a very serious question during the last few years, and in consequence everybody in these parts were striving their utmost to induce the Government to bring in a measure to alter the whole management of the road system. He belonged to an association consisting of Chairmen of Quarter Sessions, which included many very excellent men of business from different parts of the country. A committee have been formed, of which Mr. Hugessen was a member, with several other gentlemen of great experience, who were doing all they could to persuade Government to bring in some measure to do away with the present anomalies. People had come from all parts of the country, and they had been urged on by others who were really suffering very much from the present arrangement, and he thought the Chamber ought to be careful before they gave a decided opinion against a reconstruction of the system.

Mr. HAWARD pointed out the difficulty of giving an answer that should be sufficiently distinct until the measure itself was brought forward and might be considered. As had been observed, the whole question was closely allied to that of local taxation, and the view that they would take with regard to the measure of local taxation would considerably affect the decision that they might come to on this subject. The management in, or by parishes as considered distinct from the highway boards had been satisfactorily compared with the reports of the latter, but the throwing of the turnpikes upon the parishes was undoubtedly a great hardship. It was his misfortune to be located in a parish which was seriously affected in that way, but of course as there was arterial roads there should be a general bearing of the burden which was for the general good.

Mr. CORRANCE proposed "That although a change is undoubtedly required previous to a conclusive answer to this question, it is necessary more clearly to understand what will be the nature and tendency of future legislation," and he added a rider at the suggestion of the President, "That it is desirable that the Central Chamber should bring the question before the Government, with a view of eliciting their opinion, and of inducing them to consider the subject on the first possible opportunity." This was seconded by Mr. Hempton, and Mr. Everett, thinking it desirable that the questions should be answered by this Chamber, proposed an amendment, "That the Chamber should take up the questions *seriatim* and return answers to them." This was seconded by Mr. Biddell, and some further discussion ensued, in the course of which the President remarked that of course they might have one system for rural districts and another system for another part of the country, but he thought the Highway Act had many good points in it, and speaking personally he might say that if anybody were carefully to draw up a measure embodying some of the principles of that bill, it would have the effect of remedying a great many of the present grievances, and would be found to work very well.

His Lordship put the amendment, which was lost by 5 to 4, and the original motion was carried by 7 to 3.

At the annual meeting of the West Suffolk Chamber of Agriculture, in Bury St. Edmund's, Lieut.-Col. Wilson in the chair.

The CHAIRMAN said the Central Chamber had sent down certain questions to which they wanted answers from the various chambers of agriculture throughout the country. He, in order to start the question, had written out his own views as to the answers which he thought might be given to them. They were as follows:

1. That the turnpike system, except, perhaps, in very exceptional cases, should be abolished.

2. That there should be but one class of roads.

3. That the parochial system is, on the whole, the most satisfactory.

4. That it is worthy of consideration whether this system might not be effectually worked with a surveyor to see that the roads in the various parishes were properly attended to by the parish authorities.

1st. AS TO TURNPIKES.—The only justification for the turnpike system was that heavy through traffic existed, in which the intermediate parishes had no interest, and inasmuch as in almost any case the through traffic has been diverted by the introduction of railways, it follows that *all roads or none* should now be turnpike roads. But the system itself is extravagant and inconvenient, and as applied to all roads would be impossible.

2nd. A re-classification of roads is not desirable, and would only lead to extravagance from double government and confusion. Most roads lead directly or indirectly to large towns or railway stations; it is only a question of remoteness, and though the roads nearer the towns or stations have more traffic on them than those more remote, the value of the property is enhanced by the proximity to town or station, and may, therefore, be expected to bear its somewhat heavier rate.

3rd. FUNDS.—The turnpike system having been condemned, there remains only the system of rates alone, or rates with Government aid. If direct Government aid is given, it will be necessary to submit to Government inspection, which would be expensive and vexatious. If, again, grants are made in country districts, they must be made in towns also, but whilst in the former we calculate the expense of our roads at so many pounds a mile, in the latter they are calculated at so many thousand pounds a mile. It has been proposed that certain taxes should be remitted by Government to the road fund; but one of these, the horse-tax, is already gone, and if the tax on carriages were given to the roads, could the farmers' waggon and carts hope to be exempt?

4th. THE GOVERNING BODY.—After our experience of highway boards we are not justified in advising their general introduction. Nor can we see that any advantage would be gained by making the boards of guardians the managers. There are, no doubt, some objections that might be removed, such as throwing the old turnpikes upon the general charges.

The CHAIRMAN remarked that he thought they would agree with him that whatever they might think as to who should bear the expense of the roads, nothing did them so much damage as the farmer's cart, especially when carting mangold. One of the great grievances of one of the Highway Boards was that the turnpikes were thrown upon the general expenses of the board, throwing part of the expense of them upon other parishes than those through which the turnpikes ran. He had made a proviso in his first resolution because he understood that in the North there were certain places where there was an amount of through traffic, and others where there was a heavy traffic from mines, and in these places he would still maintain the turnpikes as the only fair way of bearing the expense of the roads.

Mr. BIDDELL said he approved of all the Chairman's resolutions, with the exception of one—that in favour of the parochial system. If they reverted to that, he did not think the roads would be managed nearly so well as if they were formed into District Boards. He was strongly of opinion that the expenses of roads ought to be district charges and be governed by bodies elected from the district. He quite agreed it was advisable to get the roads under one control. At present they were under the control of six different bodies. The railway companies had to keep up the roads for a certain distance where they crossed them and had constructed arches. Here and there private owners had to keep up roads. The magistrates had to keep up the roads for a certain distance on each side of the county bridges, and of these he did not suppose there were above 25 or 30 that he would not throw upon the district. He did not see why all these should not be placed under one control. The great difficulty of abolishing turnpikes was said to be that of paying off their debts, but he thought this might be safely met by the State. They need not be paid off in one year, but by payments extending over a term. If they could not get the State to do it, he thought the different counties might pay them off. He should not in all cases pay them off in full, because many of the bonds are not worth anything like par, but would commute them at what might be

assumed to be their full value. If they did revert to the parochial system he thought they would find now a greater reluctance on the part of surveyors to look after the roads. People were more commercial than they used to be, and would say they were only one ratepayer, and did not see why they should expose themselves to be found fault with and get no thanks for their trouble. They were always open to the charge of keeping the roads nearest their own residence better than those at a distance, and sometimes they had almost been accused of dishonesty but he did not think there had been much of that, although there had sometimes been something approaching it. They would have some security in the inspector which the Chairman proposed, and whom they must have under any circumstances. He did not think one for the whole county would do. They would require three or four; otherwise the expense of travelling would be heavy when they wanted him to look at some little thing or other. His own opinion was that the roads could be most satisfactorily worked by district boards; but, unfortunately, as people began to get used to them, they dissolved themselves. He thought it was a mistake of the magistrates to let them dissolve so easily. It was a very amiable thing for them to do, but he thought they displayed more kindness than judgment in the matter. The expense of the large bridges, or three-fourths of it, he would throw upon the county.

Rev. P. M. STEEDMAN: Would you make each parish pay for its own roads?

Mr. BIDDELL: No, I would make it a district charge, extending over 15 or 20 parishes, but not so many as is sometimes included now.

The CHAIRMAN asked the meeting to deal with the resolutions separately, and to consider first that condemning turnpikes.

Lord AUGUSTUS HERVEY, M.P., thought there was some difficulty in dealing with the question otherwise than as a whole. The fourth question was really the key to the matter. Unless they were prepared to say how the funds were to be raised, he did not know how they could see their way clear as to the other points. They were much obliged to the Central Chamber for bringing the subject forward, but he was not sure they would do wisely in saying they were really unable to give definite answers to these questions until the bill in anticipation, of which they were put, came before them in the usual form. Whatever solution was attempted to be proposed in the shape contemplated by these questions, it became very much a matter of detail. He had not had much experience in road management, but he thought that unless they could answer these questions categorically, they would do wisely to return some general answer, and await the bill that seemed to be expected. He thought it was very probable the question of distribution of parishes in respect to roads was only part of a much larger question, the subject of taxation generally, which was constantly coming up, and constantly assuming new shapes and forms. As soon as one tax was diminished or abolished, the incidence of the remaining taxation pressed in a different ratio to what it did before. Some years must necessarily pass before this could be rectified; and he could only suggest that the minds of those interested should be constantly directed to the subject, and that when the matter was ripe for rectification, they should put that pressure upon their representatives which was proper.

Mr. BIDDELL thought Government might wish to have information from the Central Chamber, and so obtain the views of the county on the matter.

Mr. PAINE thought they would be a useless body if they did not return answers to such questions as these. He approved of the Chairman's resolutions, except one. Those who had had experience with roads would say that the parochial management was very bad. To revert to that was almost the last thing they would like. He might differ from some of his neighbours, but he was himself inclined to desire more centralisation. He would suggest the division of the county into districts of six or ten miles wide, as the parishes might fit; and that the repairs of the roads should be done by contract under the supervision of an inspector or surveyor-general, as mentioned by the Chairman. He had had a great deal of experience in the management of roads, and he always found the contract system to be the one that answered best. All that was required was that some one acquainted with the management of roads should see the contracts properly carried

out. This was better than having a paid surveyor or sub-surveyor and an irresponsible body of waywardens.

Colonel PARKER, M.P., said he felt he should not be doing his duty to those among whom he lived if he did not express his hearty support of the propositions of their chairman. The subject now before them reminded them of what took place some years ago, and would confirm the impression many of them entertained then of the unsuitability of highway boards to meet the requirements of this district. The expression of feeling by the waywardens, whether *ex officio* or elected, had been almost unanimous against them; and he was glad to hear the chairman, after the great experience he had had, say that he found the highway system, as applied under the Permissive Bill, had not met the requirements of the country. They now reverted to the old parochial system, and he should like to know what there was in that system that any one desiring good roads at a cheap cost could possibly find fault with. Was it for a moment to be tolerated that any one should say they did not understand the management of their own roads? They had teams and carts, and facilities for getting materials of every kind, and what should prevent them making the best of them? It had been hinted by the vice-chairman that sometimes roads were not equally good all over the parish, and that there sometimes was joggery; but if the roads were not good there was under the old Act power given to two magistrates to enforce improvement, and not only that, but to inflict penalties upon the surveyors. The impression that it required a long, tedious process of indictment was quite erroneous. He need hardly say that the magistrates were always ready and desirous to do all they could, in common with the surveyors, to make the roads such as would meet the requirements of the country. They all wanted good roads, but at the same time they wanted to secure them at the cheapest cost. Was it not monstrous they should be called upon to pay people for doing what they could do themselves? They were ready and willing to do it; and were they to be superseded in their little localities by other people, and pay the cost? As a ratepayer and a farmer, he could not tolerate it. He was glad that, with the dissolution of the highway board, they were about to revert to the old parochial system. Those parishes or localities which desired to have a surveyor of their own were perfectly at liberty to do so under that Act. If two or three parishes wished to combine for that purpose, in a way not very dissimilar to the highway boards, they could not do so. While they retained under the old Act all these powers and all this liberty to do what they liked with their own, he advised them not to part with it. Long experience of ten or twelve years had shown them the Board system did not answer. They must, therefore, revert to the old system and reap the advantages the experience had given them.

The CHAIRMAN said he was originally in favour of the board system, and he was still of opinion it could be made to work; but at the same time, though he had done all he could to make it work, he was bound in honesty to say it had not worked satisfactorily. There were two reasons why the Blackbourn Highway Board was led to apply for a dissolution. They might devise the most perfect system of machinery possible theoretically, but if they had a hostile board it could not be made to work. They all knew the highway board system was not popular from the very first in this district, and to try to carry it on in the face of public opinion would be simple obstinacy. If the Act had been compulsory he thought they would have heard much less about it. The other cause for dissolving the Blackbourn Board was that Government thought fit to throw the charge of the turnpike roads upon the general charges where a highway board existed; but where one did not exist it was thrown upon the parishes. They thought it was very unjust to saddle the general fund with this. There was a hardship, it was true, in throwing them upon the parishes through which they passed, but the hardship was a very small one. It was only that the roads were a little wider than they would have been had it not been for the old through traffic. He agreed with Lord Augustus Hervey that if they could not see their way clear they had better say nothing; but this seemed to be one of the subjects with which they were so practically conversant that they would not like to say they did not know what to do with their highways.

The first of the resolutions read by the chairman was unanimously agreed to. The second resolution also passed.

The question of the constitution of the governing bodies of roads was then discussed.

Mr. J. HARRISON thought the solution of the difficulty would be to make highway boards compulsory. He had proved to the satisfaction of the Blackbourn Highway Board that notwithstanding the expense of salaries and so forth, the cost was not above a farthing and half a farthing more, than after the turnpike was brought in, a trifle under a penny. Surely a man who has his own business to attend to would not grudge that. If the Act had been compulsory there would not have been half the "to do" there had been. It ought to be within the power of the board to dismiss the surveyor.

Mr. MANFIELD: So it is, but we never got a majority.

Mr. A. COLSON did not agree with the highway board system, because it had cost his parish about £22 a-year more than the old system, and they had had no new bridges or anything of the sort. The rates were very nearly double, and the roads were no better. He thought if each parish appointed a surveyor, and there was an inspector for every sixty or seventy parishes, the work being left in the hands of the surveyor or waywarden, it would work better. He did not think there was anybody better to manage the roads than some one on the spot. He had driven a long distance sometimes to the Blackbourn Highway Board, had heard a long discussion about a bridge he never saw, and did not understand, and was then asked to vote upon the question. To men who paid Income-tax under Schedule B their time would come to more than the bridge would cost.

Mr. HARRISON called attention to the fact that two years before the dissolution of the Blackbourn Board they passed a unanimous resolution that the Act was working well.

Mr. COLSON said it was a very small board meeting when that was passed.

Mr. MANFIELD proposed, and Mr. SMITH seconded, the adoption of the chairman's resolution on the subject.

The Rev. C. W. JONES thought that if they reverted to the parochial system some supervision would be necessary, because they knew that in some parishes they found good roads, while in the next they were just as bad. He knew there was a law to compel the surveyor to keep them in order, but it was an invidious task for a neighbour to put it in motion, and a public prosecutor would be very necessary. His experience was that the highway boards were cheaper than the old system. He knew cases where men when they were ill in bed had been paid under the old system for working on the roads.

Mr. SALMON cautioned the members against any system which would introduce a stranger to interfere with their roads.

The CHAIRMAN remarked that the surveyor would always have to bring the cases before the magistrates, who would have to decide on the merits of the case.

Mr. HARRISON said he knew two miles of road under the old system that could not be put in proper repair for less than £25 a mile.

The resolution was then put to the vote, and six voted against it and three for it, therefore the appointment of an inspector was negatived.

Lord AUGUSTUS HERVEY, M.P., then moved "That this Chamber is further of opinion that any inequality of taxation to which the maintenance of roads as a charge upon real property contributes, should be met by a general adjustment of fiscal burdens."

The CHAIRMAN remarked that the purport of this was that if they took the burden of the roads upon themselves, that should be considered in regulating other taxation.

The resolution was seconded and agreed to, and a vote of thanks to the Chairman terminated the proceedings.

At an adjourned meeting of the York Chamber of Agriculture, in York, Mr. W. J. Ware in the chair, a circular from the Secretary of the Central Chamber of Agriculture was read, submitting certain resolutions which had been passed, and asked the opinion of the York Chamber on five questions, which were set forth. The first question was—Is an entire reorganisation of our road system in England, including the management and maintenance of turnpikes and highways, desirable? and on the motion of Mr. Peacock, seconded by Mr. Lett, it was answered in the affirmative, the latter gentleman observing that he did not agree with the present system, and that there was not a man in his parish who knew how to make a road. As to the second question—Is a re-classification of all roads needed?—Mr. T. Watkinson

thought that such an arrangement was most important and desirable.

Mr. LETT said a re-classification of turnpikes was necessary, because since some of these had been taken away it was very hard upon some parishes, where the roads were used by parties who had nothing to pay for it. He could not see why it was necessary to have the parishes classified.

Mr. SMITH said that all roads on which her Majesty's subjects could pass without let or hindrance should be brought under one system of management; he would make no difference between high-roads, occupation-roads, or bridle-paths. Tolls would certainly be better done away with, because now, with the present railway system, they were a complete tax on some places, whilst others were exempt. He would have the cost of maintenance defrayed, one half by the county rates and the other half by the Consolidated Fund, and all the roads put on an even principle of management.

Mr. CHOLMELEY agreed that all the roads should be on one system. If the road was a turnpike the debt might be extinguished, and if an occupation road an arrangement might be made with the proposed object in view. If they had a divided responsibility between the waywardens, the highway board, and the occupiers, they would not know how to fix the liability for repairs, and they would go on as they were, and in many places they could not be much worse. All those places should be placed under one head.

A re-classification having been resolved upon, the third question was submitted: How many different classes of roads should be established under a new system?

Mr. CHOLMELEY repeated that they should, he thought, have not more than one class. Of course to do that the debt on the turnpike road would have to be extinguished by some means; and the occupation roads could not be taken without compensation, which could be done by arbitration. Those turnpikes which were in dispute ought to be maintained by the parishes first of all. He thought it was disgraceful that anybody should now be able practically to throw up a road, and the Act said they could do so. The main principle was that every public highway should be maintained by the public, and be made one system. In Ireland they had admirable roads, which were all under the county rates. He proposed that there be only one class of roads.

Mr. LINTON seconded the proposition.

Mr. T. WATKINSON moved as an amendment that there be two distinct classes—roads that were turnpike, and roads which were not.

Mr. DUNN seconded the amendment, remarking that he did not see how the matter could be equitably worked without dividing the roads of the kingdom into two classes. The main arterial roads were not made for local traffic but for general traffic, and it would seem hard and unjust where turnpikes were abolished that the expense of the main road should fall on the real estate and property of the neighbourhood. The introduction of railways had altered the aspect of the question very much, and before their introduction such a question would never have been raised; at the same time an arrangement should be provided by which the main arterial roads might be helped—they should have some fund for the purpose and not throw the expense altogether on the parishes.

Mr. LINTON thought that all the roads should be put under supervision of the highway board.

The amendment and resolution having been respectively put to the meeting, six hands were held up for each, and the numbers being thus equal the chairman gave his casting vote in favour of two classes.

In respect to the source whence to raise the funds for the maintenance of each class,

Mr. DUNN said with reference to the parish roads he would lay the expense as it was laid at present, but as to the turnpike and main roads his idea was that the taxes assessed upon carriages and different vehicles should be made over to each county or each riding, and that out of that fund one half the expense should go to maintain the arterial roads, and the other half be paid by the parishes and townships through which they passed. That would relieve the townships of the injustice of making the roads altogether. This seemed to be a fair and legitimate course.

Mr. LINTON: Would you tax the farmers' carriages?

Mr. DUNN: I would not put on them a single tax more than they have at present. What we already pay goes to the Consolidated Fund. Give the matter a local application

and collection, and the arterial roads would be maintained from that fund; it would not be very much, but it would be something.

Mr. CHOLMELEY said he was in favour of the Irish system; the roads in that country, under the new Act, being simply admirable; in fact, he had never seen a bad road there. The expense was borne by the separate districts, which had their surveyors, or by what we would here call the different wapentakes. They might give ten years' purchase for the roads, so as to get entire control over them.

Mr. LETT would not have the roads put into the hands of the county surveyor, because that would be taking them out of their hands.

Mr. WATKINSON: Suppose half the expense should be paid for turnpikes out of the county rates, and the other half by the districts?

Mr. KILBY said in the West Riding they objected to highway districts, each township supervising its own roads and paying its own expenses.

Mr. CHOLMELEY proposed that a fund be raised out of an increased area, and not under the parochial system. The parishes would not fail to see that the roads were properly kept, and there would be no inducement to "scamp" the roads by doing cheap work.

Mr. LINTON said they should take a broad view of the question, and lose sight of any particular locality or place. The Legislature looked to them, he expected, for these repairs, and there were at present four Acts of Parliament with which they ought to have been acquainted; he would be very glad if they had but one, which would be an advantage to the ratepayers generally, whether it would be to the lawyers or not. If they were to have highway boards then they could not do better than to levy the expenses over each district. He would do away with all parish boundaries, have an equal pound rate in each district, and have but one account. He had found this difficulty, that the man who spent the least money, no matter what damage he did to the highway or how he neglected his duty—if he saved a £5 note he was the popular man, who received the place, but the man who set to work to improve damages and set the foundations of the road, got into dispute with the ratepayers, more especially if the surveyor was likely to change farms. In this manner the highway had suffered most materially, and under the circumstances always would so long as they had a constant change of surveyors without any reference to suitability, capability, or responsibility. He suggested that all parishes be done away with, that they have an equal pound rate, and all expense be levied on each district, and not on each parish. He supported Mr. Cholmeley's proposition.

Mr. DUNN was in favour of Mr. Watkinson's suggestion.

Mr. KILBY moved that each parish pay for its own roads, as at present, but there was no seconder.

On the question being put the motion of Mr. Watkinson, that one-half the expense of maintaining roads be raised from the county rates, and the other half from the district with regard to turnpikes, was carried.

The fifth and last question was, What should be the constitution of the governing body of the whole or of any one class of roads?

Mr. KILBY proposed that the ratepayers should be the governing body as at present, Mr. CHOLMELEY moving as an amendment that a county surveyor be appointed, who should be responsible for carrying out the requirements of the Act. The original motion was carried.

A MINISTER OF AGRICULTURE.—At the opening of the winter session of the Wainth Farmers' Club, Mr. Waller, of the Home Cattle Defence Association, delivered an address in which he spoke against "a sham foreign market in London," and questioned the necessity for inspection. He asked, further, whether education and cattle should be inseparably associated? and if the interests of butchers, dealers, and retailers were to be considered paramount? He proceeded to advocate the appointment of a Minister of Agriculture, in which he was supported by Mr. Saunders, of Watercombe, and others.

S T E A M C U L T I V A T I O N .

[The following letter has been forwarded to us by Lord Kinnaird.]

Rossie Priory, Inchture, 3rd October, 1874.

DEAR SIR WILLIAM,—According to your request I send you some papers on steam cultivation. Not having made up a complete statement for the past two years, I jot a few hurried remarks which may prove of service for the purpose you mention.

I began to cultivate by steam in the year 1861 with one of Howard's roundabout sets of tackle, that is, with robe and anchor at each end of the field, and one engine. In that year, while engaged on the Mines Commission in the North of England, I made acquaintance with the late John Fowler, who had devoted many years and a large amount of capital towards developing the cultivation of land by steam power; and in the year 1862 he informed me that he had at last accomplished the object of his life and had seen the way to repay the large advances made by his friends. His health having broken down, he came to stay with me for a change of air, and brought with him a 14 (nominal) horse-power engine and tackle, consisting of a windlass which, being attached to an anchor at the opposite corner of the field, moved forward parallel to the engine as the work proceeded. This plan accomplished the work better and more expeditiously than the roundabout system, which I then abandoned, as it took up more time and required more men to attend to the anchors. Fowler's clip drum for catching hold of the wire rope was a most ingenious plan invented by a pianoforte maker in his employment. Poor Fowler, who was one of the most intelligent and enthusiastic engineers I had ever met with, did not live to see his plan brought to perfection by the adoption of the double engine system. At one time I contemplated the roundabout system on an extensive scale by the use of water-power in the middle of a farm. It is a curious circumstance that the first idea of cultivating land by other power than horses originated with a farmer in the Carse of Gowrie, who made use of his water-wheel to work the plough. If I mistake not, Fowler purchased his patent. Late in 1864 I ordered a second fourteen horse-power engine from Messrs. Fowler and Co., which, with the one I got in 1862, I have worked regularly up to the present day not only on the level carse but on the hillsides: these engines are in a more efficient state than when they were started. At the earlier stages we had various difficulties to contend with, such as keeping the water in the boiler while moving on steep inclines, signalling from the one engine to the other when rising ground intervened, &c. On one occasion one of the engines in crossing a bog would have disappeared altogether had it not been dragged out by its coadjutor. Such a difficulty is now met by a simple contrivance whereby the engine is enabled to pull itself out. What I suffered most from was the frequent breakage of tackle, and occasionally the giving way of parts of the engine got in 1864. The one I got in 1862 has required little or no repairs beyond a new fire box, showing not only the engine, but the implements even of every bolt should be made of steel, or the best Low Moor, or iron of similar quality. My only trouble now is with the tubes, which are injured by muddy water. The cry for cheap engines is a mistake, as the cheap engines are certain to become very expensive through frequent repairs—breakages being the only drawback, besides the original outlay, to the general adoption of steam cultivation. No set of engines should be without an experienced mechanic, who with the aid of a country blacksmith can execute any slight repairs, or re-

place parts which may be procured from Leeds on telegraph order. I have a small workshop, with an intelligent mechanic or engineer, as I am engaged in carrying out improvements in steam cultivation. I have successfully brought into use on my farms a combined harrow and roller, and expect to be able to turn out a drain plough, to cut drains 3½ to 4 feet deep, at a cost of only a few shillings per acre. The greatest advance, however, that I have made is by the purchase of two twenty (nominal) horse-power engines for the purpose of knifing, or subsoiling to a depth of from two to three feet, thus opening up the soil, taking off the water, and letting in the air without bringing the subsoil to the surface. I am satisfied that by this method one-half of the number of drains might have been dispensed with. The value of subsoiling or breaking the "pan" is now generally admitted. It not only lets the water filter away quickly, but facilitates the roots getting down to the fresh soil. In the case of wheat, these would, in congenial soil, extend as far down as the stalk rises above the surface. The knifing can be done on clay land, where there are no stones, at a cost not exceeding 5s. an acre for coals, oil, and men's wages. Indeed, I find that all other work can be done much more economically and expeditiously by these powerful engines than by the fourteen horse-power engines, which I intend to dispose of. With a 7 or 8-furrow plough, rollers and harrows 12 feet wide, engines 600 yards apart on a 20 acre field, will give you some idea of the expedition with which the work is done by the large engines. I can even undertake with the large engines to cultivate a greater extent of land than the 630 acres which I work with the fourteen horse-power engines, by which I save nine pair of horses and six men. Taking the present price of horses at £75 per horse, harness, ploughs, and implements at £300, makes a saving in stocking a farm of £1,650, or within a little of the cost of a double set of engines, with tackle complete, costing £1,500. The higher wages of the engine and ploughdrivers, with the amount paid for coals and oil, will bear no comparison with the keep of horses—besides, when the engines are idle they do not eat. The wire rope on clay land lasts five years. Put the cost of repairs at the outside at £70 or £100 per annum, which is much less than blacksmiths' bills, and the tear and wear of horse-flesh and implements, &c. The superiority of steam cultivation over horse work was characteristically put in the remark of a farmer for whom I had done some work, when he said, "the land has never forgot it." Under steam, the farmer is to a great extent independent of the weather, as he can take advantage of the favourable days to get his crops in with an expedition no number of horses can accomplish. The question still remains, What are farmers on clay lands to do, with wages and other expenses double, a scarcity of hands, and men nothing like so efficient as formerly? It is quite clear, however, that farming, like manufacturing, to pay must be on a large scale, and to a great extent, by steam power. Small farmers must either combine to purchase and work steam tackle, or hire. I may mention that I have added to my steam force a traction engine for conveying dung to the fields, and carrying stones, wood, and other work on the estate, and with which you will see by the enclosed extract, that I have cut down and carted home corn. I hope to hear of the Carrick farmers taking up the question of steam cultivation.—Yours faithfully,

KINNAIRD.

Sir W. M. Cuninghame, Bart., M.P.,
Glenmoor, Maybole.

STEAM PLOUGHING.

TO THE EDITOR OF THE MARK LANE EXPRESS.

SIR,—I much prefer the plough to the cultivator as a weed killer and land airer, especially in hot, dry weather. We know that in wet weather on stiff clays it must be used, for the cultivator then cannot work. The long 5-foot breasts of the plough have no under-soles to press down the soil, and no horse treadings; but the earth is lifted from its bed, hurried, twisted, and broken, and dropped bottom upwards; and it then lies so lightly and loosely, and unpressed, that the sun's rays and drying winds enter freely, and parch the roots of weeds, from which the soil has been wrung or shaken. In fact, in dry, hot weather there is nothing equal to the steam plough for making a clean fallow. The cultivator moves and pushes aside the earth, and lets down the fine portions; but it does not move or turn over all the earth, and all the weeds: scarifying should be used after the weeds have been uprooted and dried by the plough. Of course the ploughmen want looking to, for as they are paid a sum per acre over and above their usual pay, there is an inducement to hurry the work, or omit to replace the worn or blunted shares by new ones. In hard, dry, tenacious clays, the ploughs will come out of and slip over the soil unless the shares are sharp and the plough sufficiently weighted. In our case two or three men in addition to the plough steerer were required on the plough; they had to jump off occasionally where the engine was "pulled up" by the resisting clay, and we can imagine what the resistance must be to stop a 12-horse power engine working at 125 to 150 lb. to the inch. In fact, steam ploughing lays bare the shortcomings of the ordinary horse plough, where the ploughman has been obliged to "ease off" the work when the resistance was too great for his horses. After steam ploughing, the subsequent working of the land becomes, by comparison, a very easy affair. Commend me to the steam plough, and after that to cultivation. The steam plough economises greatly both horse and manual labour, and very much forwards the work of the farm. In hard, dry ground, plenty of steam plough shares should be provided, for some dozens per day are occasionally required. I look upon the contract system of steam ploughing as a great boon to British agriculture. The extra few shillings per acre are as nothing when compared with the advantages gained, and I consider it a great mistake to try to depreciate it, for we get a strong fellow to do all the hard work, rendering the rest easy. Especially it is useful to those who have only a certain small number of horses which cannot be dispensed with. Farmers with little crooked fields and small gateways are unfavourably placed, and must expect to be left out in the cold when competing for hired steam with those whose lands are more acceptable to the contractors. Landowners should consider this, and remove the difficulties. Farmers are exposed to great competition as among themselves. The occupiers of undrained, ill-shaped and over-timbered fields, with bad roads and insufficient buildings, suffer tremendously in competition with their more fortunate neighbours. The buyer of wheat makes no allowance for agricultural shortcomings.

Yours,
J. J. MEEH.

October 20th.

MR. BRUCE'S SHORTHORNS.—Mr. John Cran, Kirkton, Inverness, has bought the whole herd of Shorthorns belonging to Mr. Bruce, Burnside, Fochabers, consisting of twenty-two animals.

THE LATE DUKE OF LEINSTER.—He was one of the original founders of the national system of education, and for many years acted as a Commissioner of the Board. He warmly supported the establishment of the Royal Agricultural Society in 1841, and filled the office of President until December, 1857. During the presidency of his Grace an incident occurred which threatened to upset the Society. During the famine years Mr. O'Connell became a member of the Society "for the purpose of using it to 'put the screw' on the Government. On his motion a resolution forbidding the discussion of political subjects was repealed after a long debate. The Duke, who was in the chair, immediately resigned, and he saw that the effect of so radical a change would create dissension in a society which had hitherto combined all parties for the good of the country, and that the effect would soon be to break it up altogether. His prompt and decisive action induced the members to retrace their steps, and the Society was saved." The Duke was also much interested in the prosperity of the Royal Dublin Society, and for many years was President of the Council. He was also President of the Royal Horticultural Society, and other public bodies of a non-political character. He was for over sixty years Grand Master of the Freemasons of Ireland, and in the Orphan School of that institution, and other charities connected with the Masonic body, he took a deep interest. As a landlord, his Grace was much respected by his tenants, among whom he spent most part of his life. Affable and courteous in his deportment, he was at all times accessible to those who desired to bring their affairs under his notice, and in this he made no distinction between the humblest and the most important of his tenants. His private charities were large. He taught that singularly tortuous tributary of the Liffey, the Wye, on entering the demesne, to expand into a broad river, and this again into a large and beautiful lake, the waters of which, conducted over an admirably constructed artificial, and, withal, most natural-looking cascade, again to take their natural course, and broadly flow for a long distance through woodland and rocky scenery of a very imposing character. At spots suitable for connecting the splendid drives on its north and south sides he spanned this river with stately and elaborately constructed stone bridges. The Duke was very fond of arboriculture, and many a fine breadth of planting now forms a lofty and enduring monument to his memory. Though practically not so much of a horticulturist, or taking as much of an active and personal interest in gardening as in its kindred pursuits, Carton gardens and grounds were always kept up in the finest condition. The beautiful and imposing Italian garden adjoining the mansion was his Grace's creation, and formed at the cost of a great amount of labour and expense. For nearly forty years he was President of the Royal Horticultural Society—an office which he held to the close of his life. His habits were as active as they were systematic. He was very fond of walking exercise, and few of his friends after taking a spin with him would care to repeat it. He could handle the felling axe with the skill of a backwoodsman, and many an aspiring pine, lofty ash, and tough oak tottered with mathematical accuracy to the desired line of fall from the nicely-balanced swing and unerring strokes of his Grace's axe. He was most punctual in everything, and especially so in the matter of correspondence. No matter who had occasion to write to him, even the humblest applicant for his bounty, we doubt if ever, unless under most peculiar circumstances, they had to wait much beyond the return post for a reply. We have heard it said that on occasions when his house was filled with company he always rose at five a.m., in order to dispose of his correspondence and other matters, and have thus time to give his undivided attention to his guests. His punctuality as regards payments was of a piece with that in respect of his correspondence and all other matters. Annuities, subscriptions to public bodies, charitable institutions, and they were not a few, had never to be applied for. The first day of the new year was never allowed to be a night old before they were discharged. Indeed it was one of the joys of his life to lie down each night conscious of owing no man anything but good will.—*Irish Farmers' Gazette.*

A GOOD CROP.—There is a pear-tree in an orchard adjoining the Crown Hotel, Stoke Ferry, Norfolk, which has this year produced 160 pecks of fruit.

F A R M I N G I N W A L E S.

THE PRIZE FARMS OF DENBIGHSHIRE AND FLINTSHIRE.

The following is the report and awards for the best cultivated farms:

To the Committee of the Denbighshire and Flintshire Agricultural Society.

Gentlemen,—My inspection of the farms entered for your prizes commenced this year on the 10th August, and terminated on the 14th. I selected this period as being the most suitable for seeing the grain crops at their best and the stubbles at their worst. A good corn crop in a clean stubble is one of the best evidences of good farming. It is a certain testimony to the previous cultivation while under green crop, and an equal guarantee of good "seeds" and of clean "permanent pasture" when the land is laid down to grass. Last year the corn crops were neither heavy nor clean, chiefly because the season was adverse. This year they are above the average, and the heaviest crops are on the best farmed land. Land is very honest, "Clean it well, feed it well, and work it well," and it will respond liberally to the treatment. All the farms I have inspected this year have good corn crops on them; their green crops vary in character, as also do their seeds and pastures, but they are all under superior management. The first prize is offered for "the farm not less in quantity than 150 acres, including all the land held, which is properly subdivided with fences, and is in the neatest and best order, judicious draining, watercourses, roads, gates, stiles, farmyard, &c., included; the arable land under the most approved course of cropping, and also the grass land in the neatest and best condition, soil and situation considered.

Of the four competing farms in this class I select that occupied by Mr. John Roberts, Geinas House, Bodfari, as coming nearest to this description. It is the smallest of the four, and is not so compact or conveniently situated for the homestead as the others, being intersected by a railway, and having a large piece of land in the centre, on which the church and village stands; but all is done that is possible to counteract these disadvantages. Its extent is 176½ acres. Forty of it is mountain land, 35 being in pasture and 5 in clover; 30 acres were in corn, 18 of it wheat and 12 oats. The wheat in one field of 11 acres was remarkably good, thick on the ground, and the straw bright and well headed; in the other field of 7 acres there was some coltsfoot and a few annual weeds in the stubble, but the crop was a full average, and this was the only field to which any exception could be taken as regards cleanliness. The barley, 10½ acres, was a full crop, with a good root of seeds under. First year's clover, mowed, 20 acres, very good. Mangold wurtzel, 6 acres remarkably forward and well managed. Swede turnips, 6 acres, regular in plant and growing fast. Potatoes, 2½ acres, vigorous and clean. The pasture land lying near the homestead greatly improved by a dressing of bone manure, full of white clover, and free from all noxious weeds. The upland pasture very clean and sweet. The stock consisted of 200 breeding ewes and lambs, well suited in character to the high-lying land, 13 dairy cows of a very superior class, 16 heifers and 16 rearing calves, quite equal in quality, and 2 handsome pedigree bulls, 6 farm horses, 3 colts, and 8 pigs. The poultry yard and bee stands testified also to the attention of Mrs. Roberts, as also did the state of the dairy. The garden was neat, but not made as productive as it might be. Mr. Roberts says he uses about eight tons of bone and artificial manures annually, and 50 tons of lime, applies all the liquid manure of the homestead to his grass land, and ploughs under turrow all the farmyard manure his stock makes; and he claims to have made such permanent improvements as the eradication of 3,500 yards of old fences, and the planting and raising of 900 yards of new ditto. He has a very useful collection of farm implements, a fixed steam-engine, and a well-arranged farmyard and buildings. He is an enterprising man, and has evidently done his best to win, and he well deserves the prize. All the other claimants have made a great outlay in permanent improvements and in increasing the fertility of their soils. One has eradicated 1,850 yards of old fences on a farm of 227 acres, and has reclaimed upwards of five acres of land by grubbing up tree roots and filling up ditches,

and has planted 623 yards of new fences. He also expends £100 per year in bone-dust and artificial manures, and all has been done so well that it has greatly improved the value of the occupation. Another, on a farm of 200 acres, has done even more work of a similar character, and has also made a new road of considerable length, re-formed a stack yard at great cost to reduce labour, built a stone wall 100 yards long, and expended a considerable sum on improvement of farm-house. He has also greatly improved the cultivation of one half the farm, which was much exhausted by ploughing and very foul when it came into his hands four years ago, for all of which he deserves the highest commendation. He had one of the best fields of wheat I have seen this year. The third has gutted his farm of all its old fences, re-formed its fields into the most suitable size for convenience by planting nearly 6½ miles of new fences, his landlord giving quicks and providing substantial rail fences for their protection. He has also made many other improvements, and he must ultimately bring his farm into the prize list if he perseveres in the way he has commenced. Time, and sometimes a long period of time, is essential to substantial improvement of land and to its being made as productive and profitable as all good farmers desire.

There is only one claimant for the Silver Medal of the Society, offered to owners and occupiers for the best farm under the same conditions, but I have no hesitancy in awarding it to the claimant, Major Hughes, of Ystrad. His farm is fast becoming a model farm, and after a more practical manner than attaches to most of those which go by this name. There is some extra expense incurred for appearance sake in the buildings near the hall, but the profit and loss sheet is evidently kept well under eye. The farm is a light dry soil and consists of 343 acres, divided into thirteen fields: 88 acres were in wheat, 33 oats, 25 turnips, 12 mangold wurtzel, 2 cabbages, 2 vetches, 30 mowing, 95 clover, and 40 grass, pastured with cattle and sheep. All the crops were remarkably good except the turnips, which had utterly failed through the dry weather, but had been re-sown and were now making a fair start. The stock consisted of 9 farm horses, 24 dairy cows, 40 heifers and bullocks, and 24 calves. The milk of the cows is churned by steam power and made into butter, and from 24 to 30 calves are annually reared on the farm. The sheep flock consists of 250 breeding ewes, supplemented by about 200 wethers, bought in the autumn and sold out in the following spring, 6 breeding sows, and about 30 store pigs. House feeding is largely followed with the horned stock. All clover and vetches used green are passed through the chaff-cutter and mixed with brewer's grains, bean meal, oilcake, &c. No hay or straw sold. This system yields a large quantity of manure, and places it where it can be most economically and advantageously dealt with. All the field labour, both team work and manual, is done by the piece, and a bonus is given for success in rearing lambs, poultry, &c. This system is worthy of more thought from farmers than it yet obtains. Wherever it can be applied it must be the fairest way of rewarding skill and industry in the labourer, and of stimulating and sustaining him in his efforts to rise both socially and morally, and by adopting it the farmer must get equal value in labour for his wages, and have his work done more quickly and equally well with proper supervision. Major Hughes says the plan works admirably, but he combines the practical with the theoretical on his farm more than most men, and carries out his plans with all the system and discipline of a soldier. His farming must have a beneficial influence in the neighbourhood, in showing both what can be done and how to do it.

For Premium 8, "Farms over 80 acres but under 150," there is no claimant; and for Premium 9, "Farms over 50 acres and under 80," only one—Mr. Edwards, the Brewery, Ruthin. His farm is situate about a mile from the town, and contains 52 acres, lying compactly together round the homestead. Since entering upon it last year, under lease, he has drained 6 acres, eradicated 125 yards old fences, marled 11 acres, repaired the occupation road and footpaths, which were

in a neglected state, and set up and fixed 13 gates. He has also had a large fall of timber made since entering on the farm, in accordance with agreement made with the landlord, and the place, it is evident, is already greatly improved in appearance and value by these works. His barley (10 acres) was an average crop. Beans (3 acres) a light crop. Turnips ($\frac{1}{2}$ acres) patchy in places, through the ravages of the beetle grub. Potatoes (2 acres) very healthy looking, and all the land clean and well cultivated. The pasture land (21 acres) had been much improved by draining and the application of marl and manure, and the clover (9 acres) was very good. The hedges had all been cut in and properly laid, so as to make good fences in a year or two with proper care. The stock (20 cattle, 20 sheep, and 8 pigs) were of suitable character, and the whole occupation was in commendable order.

THOMAS RIGBY, Inspector.

At Llanboidy Mr. PUGH, without trespassing on the province of the judges,* might say that splendid specimens of the black breed were shown that day, and he believed that henceforth Llanboidy would be known as the home of the blacks. They were now establishing a *Herd-book* of the stock and he hoped they would take an interest in it; it would be a thousand pities to let such a splendid lot go by. "The proof of the pudding was in the eating," and he believed that the black breed would produce as nice a bit of beef as could be wished. For himself, he was foud of a bit of colour, and did a little in the way of Shorthorn. In his opinion every man should be allowed to do as he thought best, only he ought to try and keep the breed pure; he certainly thought there was something in that. They ought to thoroughly understand breeding. With regard to horses, they had a really splendid show that day. In a book he got hold of a short time ago it was stated, with regard to horses, that if a thorough-bred mare was put to a common horse, ever afterwards she lost her excellence, and would never breed racers again. This, he believed, was said to be the case not only with horses, but with other animals. Suppose, for instance, a man had a splendid Shorthorn cow worth, perhaps, £500 or a thousand pounds, not much in these days, and she came across a £10 black bull, then according to his doctrine she would never again breed anything worth having. He did not say that this doctrine was true, but it was worth some consideration; in the meantime he would ask them to take care of their fences, and let those who had good animals try to keep them up.

The Rev. Mr. MORGAN was very happy to find that a new feature had been added to this Society—an horticultural show. About four years since he paid a visit to North Wales, and noticed that the houses of the labouring classes, especially those employed at the Penrhyn quarries, were extraordinarily clean. On inquiring the cause of this, and how it was that the gardens were so well kept, he found that Lord Penrhyn encouraged the cottagers to keep their houses clean and tidy by giving prizes. He had not the least doubt that this new feature of the agricultural society—the horticultural society—would be of much use and benefit in the future.

Mr. LEWIS (Gurrey), one of the judges of the cattle, said that Mr. Ormond and himself had had a very difficult task to perform, particularly with regard to the black cattle. He had heard a great deal about the Llanboidy show, but had never had the pleasure of attending it before that day. The black cattle exhibited in the yard he would have been glad to possess when he was farming, and the two-year-old heifers formed a stock which no man need be ashamed to own. In speaking thus he did not refer to the two-year-olds more than the remainder of the blacks, for Mr. Ormond and himself recommended the whole of the classes as good. When he (Mr. Lewis) did more farming he kept to the black cattle, but since he had retired he had been trying other breeds—Shorthorns, Ayrshires, and many others; but of one thing he was certain, that he had found nothing to equal the black for a dairy cow. Mrs. Lewis had said to him the other day, "If you are going to let me have a few cows, let me have good ones," and although he had tried other breeds, he was now going to fall back upon the black breed. He had tried an experiment with each cow, separately, with the aid of a lactometer, an instrument he would recommend them all to procure, and then they would be able to see what difference there was in the quality of the milk. By not referring to the quality of the milk, it was impossible to know what the value of the produce of the cow was. He could not

speak highly of the coloured cattle in the yard. He hardly expected to see good coloured cattle, for they were not in the same position as his neighbour, Mr. Pugh, who could buy some of the best pedigree stock in England. In his opinion more prizes ought to be given for the stock shown.

Mr. JAMES (Haverfordwest), one of the judges for the horses, they said when asked him to act he had no idea there would be such a good show. He was afraid their patience had been tried in the horse show, but the various classes were so good that the judges really could not decide. The yearling colts and the two-year-old hunters were especially good.

Mr. GIBBY (Copy Bush) referred more particularly to the sheep, which were extraordinarily good. In the district from whence he came the Llanboidy sheep had always had a good character. When he went home he should be able to tell the farmers that in the future they need not go to Shropshire or Wiltshire for sheep, and he should advise them to go to Llanboidy where they could get animals of sound constitution well worth the attention of any man. He had some sheep which he should be happy to exhibit in any show but Llanboidy; he could not bring them there, for he was certain he should be beaten. He had no doubt that once he got back the farmers in his district would never go anywhere else for their animals but to Llanboidy. He could not say so much for the pigs; the long-eared sows and the short-eared sows were very good, but the boars ought to be much better. Pig-breeding, if properly carried out, was not a small item in the profits of a farmer. He found the Berkshire breed the most profitable, and believed, if they gave it a trial, they would find so too. In the course of a few years they would have to come to Llanboidy for the best things in the country.

Mr. ORMOND (Wedlock) said it was the first time he had ever acted as judge at Llanboidy, and he was really surprised at the show of sheep; it was first-class. The boars were not up to the mark, and some ought not to have come into the yard at all. The sows, however, were very good.

Mr. THOMAS (Derlys) said some years ago it was enough to bring an ordinary animal and take the prize; but now the horses must be brought in good condition, reared well from the time they were foaled. It was the same with sheep and cattle; if they did not bring good things they had no chance of winning at Llanboidy. The sheep were, as the judges had remarked, first-class, and they were getting better. Three or four years ago they never saw a sheep trimmed; now he proposed that the Society should offer a prize for the sheep that was best trimmed. Next year he himself intended offering a prize of one sovereign for the best trimmed sheep in the yard.

Mr. BUCKLEY, the Vice-chairman, said this was the first exhibition of this society at Llanboidy that he had yet attended. Agricultural shows of this kind were very interesting to him, as farming had always been one of his hobbies. The stock shown at their show was well worth looking at. He had kept a large quantity of Shropshire sheep, and had bought some at Mr. Preece's sale in Shropshire, but in his opinion the sheep exhibited in the yard to-day were as good as those, and were quite fit to go to Shropshire, and cut a very respectable figure there.

Mr. POWELL, the Secretary, said with all the improvement which societies such as these created between landlord and tenant, and with all the improvements made in stock, there was yet one class which had not changed for the better in this country. The class to which he alluded was one of the most important to the farmer, without which he would not be able to carry out his affairs; he meant the labouring class, the most helpless and dependent of any class in the county. As long as health and strength and work remains everything was right, but let sickness or old age come on, the whole machinery was put out of gear, and he had to depend upon the charity of others, or to tender mercies of a board of guardians. To provide against that there had been established in this county—in fact, in the three counties—a society which he hoped would better the class to which he referred. He would no further detain them on this point, but would earnestly beg and entreat the serious attention of all farmers to this society. He was sure that if they once put it to their hearts they would give it their warmest support. The president of this meeting, and the vice-president also, had allowed their names to be added to the list of trustees, and they were also liberal supporters of the scheme. He believed that the Society would do a vast amount of good; it would enable the labouring man to provide for sickness and old age, lay by an

annuity for himself or his children, and make provision for death. He was happy to say that Mr. Buckley had undertaken to occupy the chair at a meeting to be held at St. Clears.

Mr. BUCKLEY said, as Mr. Powell mentioned his name in connection with this Friendly Society, he would like to make a few remarks on the matter. He had put his shoulder to the wheel in connection with it, because he thought it would be a most excellent thing for the labouring classes. The labourer of this part of the country, as far as he could judge, seemed to be pretty comfortable, but the thought must sometimes occur to him, "What will become of my wife and family if I am overtaken by illness? we have nothing but the workhouse before us." That was a very gloomy thought, and must hang continually like a cloud over the labourers' mind. He (Mr. Buckley) had taken the opportunity to speak on this subject, because most of the gentlemen present had it in their power to help forward this great Society, for the three counties. He believed this Society was a most admirable one, and one that would work an immense amount of good. He should like to mention what he considered a serious omission in the proceedings. No notice had been taken of the beautiful flower show, under the tent in the field near the school, which had been got up at very considerable labour and expense. The wonder was how such a show could have been brought together, and he was sure the visitors would have been more numerous, had not the weather militated so much against it. The fruit show was very fine, and was much to the commendation of the neighbourhood. There were also some beautiful flowers, and the cottagers' exhibits of wild flower devices were really so beautiful, and so tastefully got up, that they excited the admiration of all present, who were best able to form an opinion on such things.

Mr. THOMAS, the secretary of the United Counties Friendly Benefit Society, said, long before this Society was commenced, he had thought of something of the kind. The time for talking about it was now gone by, the time for action had arrived, and they were now working in right earnest. Still everything could not be completed at once; the work was being done as fast as possible, and a good deal of necessary routine matter had been completed. He had visited Cardigan in the course of the week for the purpose of establishing a branch there, and he was glad to say the Society would meet with a good reception in the town of Cardigan. He was surprised to find that in that town there was only one society, a branch of the Odd-fellows, and a small club. This fact would serve to show the great need there was in three counties for a society of the kind they were establishing, and he had no doubt it would work its way in a short time.

At Carmarthen, Mr. PUGH, the High Sheriff, expressed his great satisfaction with the show as a whole; the blacks, the horses, and the sheep were all first rate. He read a short extract from Youatt on breeding, which set forth the danger that lay, in using a poor stallion with a good mare, of ruining that mare for ever, and making her quite unfit even if the best stallion obtainable were afterwards used, to give a pure racer. He had referred to this fact at Llanboidy, and now gave them the exact words of the writer he quoted. He strongly urged them all to keep to pure blood.

Lord EMLYN, the Chairman, desired to say a few words on some important subjects which interested them, and this without trenching on the rule of the Society. A question greatly affecting agriculture, which had been the subject of considerable controversy and discussion, and the cause of annoyance and difficulty in this county, it was proposed to deal with by Act of Parliament last Session. This had not been done. Now, before blaming the Government for not bringing forward the subject, they had to remember the circumstances under which they came into power. Whoever deserved blame for the present Government not coming into power sooner it certainly was not the Government themselves, and it would, therefore, be unfair to blame them. They had no recess in which to prepare their important plans, and nothing had been done last session in this matter. Mention, however, of such a bill might be looked for on the House re-assembling. There could be but little difference of opinion as to the necessity of some such measure as he referred to; of course, he spoke of a measure for in some way allowing the tenant the benefit of unexhausted improvements. He hoped that before they met here again on the occasion of the annual show that some measure of that kind will have been passed by Parliament. The concessions that had been made by the budget in the

relief of a farmer from various imposts could not but be gratifying to them; they were, besides, promised a consideration of the whole question of Local Taxation next session.

Mr. JONES, M.P., congratulated the Society on the show held that day and the excellence of the cattle, reminding the farmers of the great value there was in the rearing of Herefords, which he should like to see spread more over the country than was the case. He referred briefly to the capabilities of the country for cattle breeding and came then to speak of matters parliamentary. This last session the Government had been blamed for making it uninteresting; it might have been uninteresting to those who were bound up in the sensational legislation of the times which had gone before; but it could not be said with truth, that there had been little doing to advance the interests of the country; that had indeed been asserted, but the complaint was not founded on any correct estimate of what had been accomplished, as he believed could be proved by a few words. The expense of lunatic paupers to the local ratepayers had been very much lessened; the tax on agricultural horses had been abolished—a great and undoubted boon to the farmers, which he hoped would be followed before long by the removal of the tax on sheep dogs as well. The consideration of the whole question of Local Taxation would be a prominent work of the next session. There was an undue preponderance of the rates he thought falling on the land. As to the lessening of the Income-tax, he was of opinion that Schedule D was the only one as to which there was just ground for complaint; were Schedule D modified, he would not object to the rate, nor to seeing it one levied at 6d. in the £.

At Tarpoley, Mr. TOLLEMACHE, M.P., believed, on the whole, they might congratulate themselves on their agricultural prospects this year. During the spring he was engaged in London, but if he had been down in Cheshire during the very dry weather which then prevailed, he feared he would have availed himself of the truly British privilege of grumbling. But matters afterwards turned out better than we thought, and we knew there had been a very good harvest throughout the country. In Suffolk the wheat crop had been most excellent, and he believed it was also very good in Cheshire. Barley was good, and the potatoes very promising. We might, he feared, be rather short of hay, but he hoped we should not have a severe winter. He had plenty of grass at present, stock was generally healthy, and if proper precautionary measures were used we might continue to remain in the same satisfactory condition. Some years ago his father tried an interesting experiment, which perhaps Mr. Rigby and others would remember; he had two yearling heifers vaccinated after which he sent them to stand for some weeks between animals affected with pleuro-pneumonia. Notwithstanding their proximity to the infected animals the heifers returned home perfectly sound, and although he knew there were great differences of opinion on the subject of vaccination, still he could not help feeling that if vaccination received a fair trial it might prove an effectual safeguard. He had referred to the harvest in Suffolk. In the west the wheat crop might not be so plentiful, but at the same time they had not shared the difficulties there which the east had with regard to labour. Although not a single labourer on his father's Suffolk estate joined the Union, there was no doubt whatever that there was a better feeling between employer and employed, and he trusted that the warning they had from their Eastern Counties friends might not be lost upon them. He hoped employers would show increasing forbearance, foresight, and kindness in relation to the employed, and thus establish a permanent bond of union between them.

Sir PHILIP GREY EGERTON, M.P., dared say that some of his friends who saw him scrambling about in the vales, endeavouring to put salt on partridges' tails, thought he might be better at home instead of idling his time away like that, and perhaps they might be right in one sense; but while he was rambling across the country in search of wild partridges, endeavouring to put salt on their tails, he was also taking care that no one should put salt on his tail. He read a story in his youth, "Eyes and no eyes," which materially helped to induce in him the habit, whether hunting, shooting, or walking about, of using his eyes; and though ostensibly in search of sport, he had opportunities of seeing what he could not see otherwise. He thought he could tell them where to find a field of docks and rushes, or a field of good white clover; and he not only

knew the field, but the farm where it was. Of course he went into every field, because if he missed one he might miss a covey of birds. He thought he knew, too, every ditch that wanted cleaning out and every gate that wanted repairs—and he might tell them that whenever he found a gate tied with a withy he always cut it. It was a slovenly, idle plan which he could not endure. If he were a farmer he would never go out without a small hammer and a few nails in his pocket. As a geologist he had been accustomed to carry a hammer, and he was quite sure he had often carried more fossils than the weight of a few nails would be. One nail might help to make up a gap, or save a gate, which it would cost a good deal to repair afterwards. Therefore he did not devote himself entirely to sporting, but took note of what he saw, and remembered it too, and perhaps his neighbours might hear of it some day or other. He knew fields which would be very much advantaged by draining, and he knew fields where there was as fine grass and clover as anyone could wish to see. Then the search for sport gave him an opportunity of seeing what damage was done by hares and rabbits, so that he could give his keepers instructions respecting them; also the opportunity of seeing what trees were killing the fences, and which should be removed, and he took note of that. He could also see what mischief had been done by the hounds in the previous season, and without taking that for granted, he could see where wires had been run through fences, and assured them that if an accident happened as the consequence of that, and he were on the jury, he would never quit it until a verdict of wilful murder had been returned. All these matters he might tell them in confidence came before him in walking across country, and he did not trust to one pair of eyes, for his friend Mr. Beckett, who was fond of sporting generally went with him. And he would say this much, while upon what he had seen, that the general effect of what he had seen was highly satisfactory, and he did not think there was any county in England where agriculture was more extensively and judiciously carried out than it had been in this for the last few years. With reference to the present season, though they had had a very serious drought—and when he went aloft in Lord Ducie's yacht, he felt very downhearted at the prospect—he never in his life had seen such fine crops, such splendid pastures and clover, as he had seen this season; and if it was only open whether this side of Christmas, he thought the deficiency of the hay harvest would not be felt. He thought proof of what he had been saying was afforded in the condition of the animals exhibited, for he had never seen finer, and he trusted the show would continue to be what it was, one of the best local shows in the county.

Mr. TOMKINSON, the chairman, congratulated them upon the prosperous season they had passed. In Leicestershire and other counties they had suffered more than in Cheshire, for which we here had reason to be thankful. Lastly, he congratulated them upon the absence of those differences between employers and employed which culminated in the disastrous strike in the Eastern Counties, and which so embittered the mutual relations which previously existed between the various classes of society.

Mr. FINCHETT, in responding for the "Successful Exhibitors" strongly condemned the practice of over-feeding, and thought the most fastidious could not find fault with the stock exhibited at the Tarporley show. As an exhibitor of cattle, he gave it as his opinion that the pure-bred Shorthorn was not the best adapted for dairy purposes; at the same time he would advise every farmer to purchase a thorough-bred bull as a crop to the stocks now kept in Cheshire; the progeny of this crop if not good milkers were much improved for feeders—a fact not to be lost sight of in these days of dear beef.

At Ruthin, Major CORNWALLIS WEST, the chairman, had often heard it asked among his friends, "Do these societies do any good to the small Welsh farmers?" That was the question for them to decide. If they did not, he would say let them try to make such an alteration that the small farmers could compete in separate classes, and not oblige them to compete against the tenants of large farms, who possessed nearly the same advantages as landed proprietors. The importance of agricultural pursuits was growing with the question, How shall we provide for the increasing population of the country? Thank God we had a harvest this year the yield of which had been almost unprecedented, not only in this country but in France, and it would be an immense gain to the people.

What did it mean? It meant that this year we should not be obliged to purchase so much corn as we should have had to purchase otherwise; in fact, we should have to purchase two million quarters less, which represents a sum of £12,000,000 that will go into the pockets of the working men of this country. He hoped that they would be the better off for it, that they would at least indulge themselves, their wives and children, in some harmless luxuries, instead of spending their money upon an article the sale of which was becoming an increasing item in the revenue of the Chancellor of the Exchequer, he meant the consumption of spirits, for which a sum of £15,000,000 was spent last year. He would not attempt an amateur lecture on farming, for it would be absurd to do so, but he might observe that, owing to the fickleness of our climate in a great measure, no positive rules could be laid down in regard to successful agriculture. Next to the climate, it depended so much upon the industry, ability, and intellect of the farmer. They could not say what crops should be grown in a particular district, and whether a farm should be large or small. It was ridiculous to suppose that in mountainous districts people could be found with capital who would take a farm of any size. He recollected a friend of his said he was farming on a large scale, and, when asked how many fields, he said, "Only three." Well, that did not sound like a large farm, but he explained that the fields were 600 acres each. It would be absurd to have such farms as that in Wales. He congratulated them upon the absence of such disturbances as had taken place in the Eastern Counties. He believed that the labouring classes in those parts were better paid, more contented, that they had nothing to fear on their part that there would be any such rising. Let it not be supposed that he was saying a word against the right of any labouring man to better his condition, if he could do so. What he deprecated was the interference of those loquacious emissaries who went about setting class against class. But at the same time—and in that his friend Mr. Scott-Bankes could bear him out—all who knew anything of the frightfully-abject condition of the labourers in the south must admit that they had a right to do what they did. Speaking next of the tenure of farms, he thought it of so much importance that he had offered a trifling prize for the best agreement, and no doubt upon that a few remarks would be made by Mr. Sandbach, and, as Mr. Osborne Morgan would have to speak to the toast, he (the speaker) ventured to express the hope that the Legislature would do nothing but what was fair and just in regard to contracts which should bind landlord and tenant. He would not prolong his speech except to say that he believed the general condition of that part of Wales was improving, for the last statistics issued showed that the rates were diminished, and that there were fewer paupers than in any other district of the United Kingdom. He was delighted with the change which had been made in regard to the dinner, as it had resulted in such a large assemblage as he saw before him, landlords and tenants, and their wives and daughters, sitting down together irrespective of differences upon political and other matters. He hoped that would still be the case.

Mr. H. R. SANDBACH, for the judges, speaking of the farm agreements which had been sent in to compete for the President's prize, said that one thing which struck them was the extreme variety, each differing from the other. He did not think any two were the same as to the period of entry, and with regard to the one which they thought to be decidedly the best, there were two points upon which he wished to make some remarks. They considered the science of agriculture a progressive one, and thought, therefore, that the tenant should not be obliged to observe one stereotyped method of farming, as that would bar his progress. The fewer restrictions placed upon the tenant the better, until the period when he had notice to quit, and then it was necessary to protect the interests of the landlord, as between out-going and in-coming tenant. The agreement to which the prize was awarded was that signed by Mr. Jones, of Aberystwith, but in that they thought the notice to quit was too short: it was six months, and it should be twelve months. The other point was as to the cartage which the tenant engaged to do for the landlord. A blank was left in the agreement, but a note suggested that the tenant should do a day's carting for every £20. They thought that a day's carting for every £40 would be sufficient. He mentioned those two points because the Society would wish probably to obtain all the benefit they could from the publication of the agreements. The date of

entry was the 29th of September, one not very usual, but that was not of much consequence, providing it could be made to coincide with the entry of the in-coming tenant. The condition was that the whole crop being then on the land the landlord should have the option of taking it at a valuation. The 2nd of February, the 25th of March, and 25th of November, were among the dates of entry which they met with in the other agreements.

Mr. OSBORNE MORGAN, M.P., had lived amongst Welsh farmers from childhood, and had often noticed the kindly relations which existed between the farmers and labourers of Wales. He did not think there was another part of the kingdom in which there was such a kindly understanding as in that part. In a letter to *The Times* a correspondent had adverted to the fact, and it was supported by his own experience, that the same was the case between landlords and tenants; and he could not help thinking that one of the chief objects, and one of the chief uses of meetings like that—of course the first object was to encourage agriculture—was to promote friendly feeling between landlord and tenant, to make the landlord something more than a mere receiver of rent, and the farmer something more than a mere producing machine.

At Welshpool, Mr. HANBURY TRACY, M.P., thought that the state and prosperity of the country was a matter of congratulation. As to the show, they were also to be congratulated on the many excellent productions it contained, but he regretted that there was no competition for implements. Had there been, the show in that department would have been much larger, and he certainly should have been pleased with a larger show of implements, because the present and future welfare of agriculture depended almost entirely upon them. But machinery was daily progressing and creeping into places where it was never seen before, inasmuch as farmers were seeing the necessity of it. They had had a serious strike of agricultural labourers in the country, but it had not come to their county, because both farmers and labourers work well together. He thought that strike had shown one or two things, and one of those things was that where they had a fixed rent to pay, the wages ought to be fixed also, if they had to keep up a certain number of labourers all the year. Farmers might be able to pay higher wages with a smaller number of labourers, but they must be skilled labourers. The introduction of machinery was, as it had ever been, the result of strikes, and there could be no doubt that machinery was gradually finding its way into agriculture, from the steam harrow to the steam thrasher. He and his colleagues were well aware that they had gone ahead in Montgomeryshire with machinery, some of which, it must be confessed, was very unpopular; and he need scarcely tell them that he alluded to that very unpopular specimen of it—the Forden traction engine. There had been no end of correspondence on this subject, and complaints of the nuisance the engine was, but all that he or Mr. Wynn could do, as yet, the Forden traction engine was still on the road. A bill was introduced into Parliament too late last session to be of any use to remedy these nuisances, and it fell to the ground. He might be allowed to remark, in closing, that he believed machinery was re-organising and settling the question of labour more effectually than any strikes ever could do.

Mr. W. W. WYNN, M.P., the chairman, thought the county could not support three or four societies of the kind, and for that reason he advocated concentrated support. Machylyleth had one for a short time, but it fell through, and the Llangollen society could not hold its meeting this year, and was languishing for want of pecuniary assistance. He could not think that so many societies could offer prizes worth competing for. He hoped they would become a circulating Society, and then they could support one good one. These things may not be palatable; but as president of the society he thought they were wholesome truths that it was his duty to tell them. He was sure the two larger towns of Newtown and Welshpool would know that in doing what he had he had done what he could for the best. He hoped, in settling the show of 1876, they would be actuated by the liberal feeling of give and take, and see whether it would not be well to try one of the other smaller towns next year. He thought, on the whole, and considering the drawbacks to which he had adverted, that the show this year had been a tolerably successful one. Amongst the ponies, from 11 to 14 hands, he saw nothing worth looking at. There was room for a good deal of improvement in the

cobs, and he thought a large quantity of grass land in that county could be profitably used in rearing good ones. Prices for this class of horses were very high. Ponies that he could have bought 20 years ago for £20 to £25, were now fetching with ease £50. But of all the stock that in his opinion paid well, he thought nothing could equal their Montgomeryshire waggon horses, and every colt that a farmer bred from these horses was a good bank-note in his pocket.

Mr. Alderman WITTY, the President, did not seem to take a very flattering view of the show, but it should be borne in mind what a bad season—from the long drought—it had been for cattle. In fact, it was doubted at one time whether they should have a show at all. They had certainly a larger number in some classes than last year, but there were some splendid sheep and cattle in the show for all that.

At Penybont, Radnorshire, the Hon. A. WALSH, M.P., said measures were passed during the last session for reducing local taxation, for which he believed that next year all ratepayers would feel the benefit. There was besides the repeal of the duty on horses, and he did not know any class who would be more benefited by that measure than farmers in the grazing districts, whether of cattle or of sheep, because it was a necessity for the farmer to have a horse to ride over his farm, and to look after and herd his sheep; in fact, in those mountainous districts it would be impossible for a sheep farmer to carry on his business without. They were as much a beast of labour as the cart horses. The rates had been lightened also by the rating of plantations, game, and mines, although—and he wished there were more mines in the county—he feared that rating of mines would not so much benefit the ratepayers of Radnorshire as it would those of some other counties. He believed that from the sources he had mentioned there would be a great alleviation in the rates next year. There would be many questions that would have to come before Parliament next session in the interest of the farmer, but he would forbear to enter into them, not wishing to disturb the serenity of the company. They would entail many questions which could not be mooted in an unpolitical spirit, and therefore he would not go into them. Turning to the subject of the show, he must remark with pleasure on the increased attendance over last year, and he was told by competent judges that the show generally that day was very good indeed. He must say, however, that he should like to see a little more competition. He knew that the committee had very great difficulties to contend with, because it was hard to draw a line between the different districts to compete one with the other. It was quite ridiculous to say that farmers from the Valley of the Wye, from whence the chief winner that day—a personal friend of his, though not a political one—had come, could compete on equal terms with the higher portions of the county and those farmers whose lands were not so valuable by nature, but he did hope that the committee, having the advantage of practical men to guide them, would be able gradually to institute different prizes for those districts, so that they would be able to see the hard-working farmer who worked for his livelihood, and spent his whole capital on one of the less favoured farms, competing for and receiving the best rewards for the most meritorious animals. It could hardly be supposed that an association only two years old should be brought to perfection in that time, and he had no doubt that every succeeding year would bring a fresh stimulus to it. So long as the farmers supported it, so long would the gentry do so, and they would all go hand in hand in trying to keep the association on its legs, totally irrespective of politics, and with a view to increasing the value of the stock on the farms in the county. The Radnorshire Company had this year given a prize for turnips, and he understood it was the intention of Mr. Price, of the Mill, to give next year a £5 cup, because they must all remember how much the cattle depended for their winter feeding upon those and other roots. They must, therefore, give their attention, not only to the best breed of animals, which might fail for want of subsistence, but also attend to the feeding of the same. He should therefore like to see, another year, additional prizes given for roots.

Mr. SEVERNE, the chairman, said one of its most interesting parts had been the trial of sheep dogs; and, *appropos* of them, he must say he should certainly like to see the tax upon such dogs removed. Mr. Walsh was in Parliament he believed when that tax was put on, but he then represented Leominster, where the people did not care for those dogs, and

perhaps would rather have the tax levied upon them. As for any reductions of taxation he believed that those reductions were suggested by the permanent officials of the Inland Revenue and adopted by whatever party might be in power, so that no party was responsible. As a humble individual his opinion upon the subject was powerless, but as the president of the Radnorshire Agricultural Society his voice perhaps might have some weight, and he must say that a more shameful tax than that upon sheep-dogs was never imposed. He did not think that a farmer ought to keep a dog or starving curs to run all over the country and bark about the neighbouring houses at night, but it might be left to the magistrates to say how many sheep-dogs were required on each farm. No doubt Mr. Walsh would take credit for his friends the present Government, and to a certain extent they were his (the Chairman's) friends too, though he was no party politician, for having removed the tax upon horses, but in his (the Chairman's) opinion they ought rather to have taken off the tax upon sheep-dogs, and put them on the same footing as sporting dogs. The tax upon sheep-dogs he considered ought far more to have been removed than that upon horses, and he was satisfied that the present anomalous state of things upon the subject could not long continue. The tax was in fact equivalent to a tax upon a man's tools of trade. As for the Radnorshire Agricultural Society, he thought they had placed it upon such a basis that it would be an institution of the country. Soon after it was founded, Mr. Dansey Price had communicated to the secretary that a gentleman would give £500 towards it, provided that it was to be moveable to Knighton and Presteign. The founders of it had, however, invested their money upon the principle of its being held in a central position at Penybont, and to that effect a reply had been sent to Mr. Dansey Price. He was sorry to say that the gentleman who offered the £500, and who appeared to be a well-wisher to Radnorshire, was very much hurt at the reply. The committee were unable to ascertain who that gentleman was.

Mr. DANSEY PRICE, in returning thanks on behalf of "the unknown gentleman" who was a well-wisher to the interests of the Society, said he was excessively pleased to see how much the Society was progressing and promised to report to his unknown friend accordingly. The offer, as the Chairman well knew, was a *bona fide* one. It might, he thought, be modified in any way to suit the feelings and wishes of the Society, and was one that would, he was sure, if accepted be the means of making the Society a permanent institution of the country. It must not be omitted that in asking for the Society to be considered a county association they were giving up the meetings that were held at present at Knighton, Presteign and Wye-side. What his unknown friend proposed was to make the Society to a certain extent migratory. He dared say, however, the offer might be modified, and that the gentleman would not wish to make a hard and fast bargain. If the Society carried out the object it was endeavouring to do—namely, to get the proprietors of both the upper and lower districts to send their cattle to one show, and could afford both like advantages, so as to please all parties, it would be doing what a county society ought to do—namely, improving every part of the county from one end to the other, and especially those districts which most required improvement. He hoped the Society would try to come to an agreement with his unknown friend, and so try to put the Radnorshire Agricultural Society on a firmer basis than ever it had a chance of being before.

Mr. W. HAWKINS (Weston), a judge, had been at two or three other shows this season, but he did not know that in the cart-horse classes he had seen better horses at any of them. They were good enough to be shown at any exhibition in England. In fact he had never seen better in his life.

Mr. W. BALL (Kington) confirmed Mr. Hawkins' remark. Although he knew the county well, he was certainly very much astonished to see the horses exhibited that day, and he must compliment the gentlemen of the upper part of the county on the class of cart horses they had produced. He wished he could say the same of the other classes.

Mr. F. ROGERS (Coxall) thought in some classes the stock shown last year was better than that which he and Mr. Evans had been called on to judge that day. He thought that another year it would be well for the committee to get other than Herefordshire men to act as judges, although some of them were Radnorshire men; he was himself for one, and he still thought there was not a better county in all England

Still it was better that in some classes—the mountain sheep especially, which were very important stock in Radnorshire—there should be gentlemen of greater experience of them than Herefordshire men to judge of their merits.

The Hon. A. WALSH, M.P., explained that there was no man in Radnorshire had a greater hatred to the tax on sheep dogs than himself, as he thought it was a most unjust tax, and he was fully prepared in that session, if no one else had done it, to move that that tax should be abolished, but the Chancellor of the Exchequer, in introducing his Budget, stated that next year he would hand over the tax on sheep-dogs to rate-payers, for them to do what they thought fit with it; and, therefore he (the Hon. A. Walsh) and other members who represented feeding and sheep breeding counties determined to wait until next session, to see if he (the Chancellor) would redeem his promise. If he did not, then they would bring forward a motion upon the subject, and would fight it to the last.

TOLL ON STEAM AGRICULTURAL IMPLEMENTS

—A case came on at the Steyning Petty Session in which George Woolgar, of the Bramber Turnpike Gate, summoned the Penhurst and Chiddingstone Agricultural Steam Company (Limited) for refusing to pay toll in respect of two steam road locomotive engines, containing within themselves (using the words of the Act) the machinery for their own propulsion, together with certain carriages or implements annexed thereto. Mr. Lamb, of Brighton, appeared for the toll-gate keeper and Mr. Goodman, also of Brighton, appeared for the Company. Mr. Lamb opened the case for the prosecution by putting in the Local Act obtained in the year 1860 by the trustees of the Bramber-road, in which certain tolls were authorised to be taken in respect of agricultural road steam engines and carriages drawn by them. Mr. Lamb also referred to what is generally termed the "Locomotive Act, 1871," by which it is enacted that all clauses and provisions of any Local Act relating to turnpike roads shall apply to locomotives so as to render the owners liable (notwithstanding the General Act may have been passed subsequently to the Local Act) to those tolls specified in such Local Act. It should be stated that in the General Act referred to tolls are authorised to be taken by trustees of local turnpike roads, as follows: "Such a toll for every two tons weight that the locomotive shall weigh, as shall be equal to the toll by the Local Act made payable for every horse drawing any waggon, &c., with wheels of a width similar to those of the locomotive." Mr. Lamb then called the gate-keeper to prove the passing through the gate, on the 10th ult., of the two locomotives, attached to one of which was a van used for sleeping purposes by the men, but admitted not to be for agricultural purposes. Mr. Lamb also put in the Acts of Parliament relating to exemptions from toll, which were afterwards referred to argumentatively by Mr. Goodman, as will be seen below. This was stated to be the case for the complainant, with the exception of a point raised by Mr. Lamb as to whether a contract for ploughing land could be considered as a *hiring* of the implements by the person contracting. On this point the magistrates expressed an opinion, as it did not immediately arise. Mr. Goodman then addressed the Court in an able manner on the part of the defendants. He contended (citing several cases in support) that the mere fact of a person contracting with another to do certain work did not make the one who engaged the other a hirer in respect of the articles and goods employed in carrying out the contract, for inasmuch as no action of trover in this case could have been maintained by the farmer against any one who might have removed the engine, there could be no bailment. It was also contended that inasmuch as toll had been tendered and refused in respect of the van no liability attached, and that as the locomotive was drawing implements of primary importance in agriculture, toll was not payable on the locomotive drawing the van. Mr. Goodman quoted several Acts of Parliament, and cited several cases, the most important of which was "Reg. against Matly." The magistrates retired to consider their decision, and on their return the Chairman stated the justices were of opinion that the exemption from toll attempted to be made out in respect of the van had not been proved, and also that the liability to toll of the locomotive drawing the same had not been established. Accordingly toll had to be paid for the van and not for the engine. A clergyman, the Rev. J. Goring, was Chairman of the Bench.

NORTH SHROPSHIRE AGRICULTURAL SOCIETY.

MEETING AT NEWPORT.

Of horses there was a large show, but as regards quality not hardly equal to what had been seen on one or two previous occasions. Over 220 animals were shown, and they were divided into 17 classes. The Shorthorns formed a large class, but were a good deal mixed. The entries of Messrs. Sneyd, Bradburn, Horton, Radcliffe, Bennion, and Bickford were good specimens; while the Duke of Sutherland's bull's pedigree was not given. Of Shropshire sheep there was really a great show; the number of entries was 120, and the animals were divided into seven classes, namely—Aged rams 11 entries, shearlings 10, ram-lambs 22, seven pens of ewes of 20, five pens of five ewes each, nine pens of five each each, lambed in 1873; ten pens of five ewes each, lambed in 1874; or, in all, 303 Shropshire sheep. The names of the winners—Griffith, Mansell, Beech, Nock, Yates, Smith, and Wilkes, are guarantees of the character of the stock. The pigs made a poor show; there were only eight entries, comprising twenty-four pigs, certainly a bad muster for a show which embraces so wide a district. Of cheese and butter there was also a rather limited show; but in wool some good competition. Of implements the show was the largest ever seen at an exhibition of the Society, and holding a conspicuous place in the showyard was a collection by Messrs. Corbett and Peele, of the Perseverance Iron Works, Shrewsbury. Lewis and Co., of Shrewsbury, also showed an assortment of implements, and Underhill, of Newport a very large stand; while Corbett and Son, of Wellington, also had a large assortment. Gower and Son, Market Drayton, another varied collection. G. Aston, Newport, showed a number of Bradford's washing machines. E. Webb and Sons, of Ivy Mills, Wordsley, Stourbridge, had a stand of seeds, manures, and agricultural produce; and Proctor and Ryland a collection of bone manures for autumn use, and several fine samples of roots.

PRIZE LIST.

JUDGES.—AGRICULTURAL HUNTING AND HACK HORSES: Mr. J. Lea and Mr. J. Belcher. **CATTLE:** Mr. Jackson, Mr. J. Heatley, and Mr. Groves. **SHEEP:** Mr. J. Evans, Uffington, and Mr. Keeling. **PIGS:** Mr. Burgess and Mr. Eurdley. **IMPLEMENTS:** Mr. Stanley and Mr. Gouldbourne. **CHEESE AND BUTTER:** Mr. G. Lewis, Market Drayton; Mr. Platt, Mauchester. **WOOL:** Mr. Thompson, Shrewsbury; Mr. Smith, Shrewsbury.

HORSES.

Stallion for agricultural purposes.—First prize, £8, W. Williams, Dryton, Wroxeter. Highly commended: I. Lowe, Donington, Newport. Commended: W. Allen, Cherrington Manor, Newport.

Mare with foal, for agricultural purposes.—First prize, £7, R. C. Pooler, Adney House, Newport; second, £3, S. Lea Castle Hill, Spoonley, Market Drayton. Highly commended: T. Jackson, jun., Sowdley, Market Drayton. Commended: S. Bourne, Goldsmith House, Burleydam, Whitechurch.

Pair of horses for agricultural purposes.—First prize, £6, S. Bourne; second, £3, W. Hunter, Offosey, Shifnal. Highly commended: J. Heatley, Old Springs Farm, Market Drayton.

Horse for Agricultural purposes.—First prize, £4, T. Booker, Sutton, Newport, Salop; second, £3, J. Swift, Weston Jones, Newport, Salop. Highly commended: T. Ratcliffe, Cheswell Grange, Newport, Salop. Commended: G. McKnight, Mossy Green, Oakengates, Wellington.

Colt for agricultural purposes, foaled in 1871.—First prize, £4, R. Heatley, Eaton Grange, Market Drayton; second, £2, H. Pooler, Cheswell, Newport. Highly commended: J. Attwood, Weston Jones, Newport.

Colt for agricultural purposes, foaled in 1872.—First prize, £3, S. Lea; second, £2, J. Hammonds, Heath Hill, Newport.

Highly commended: W. D. Turner, Oulton House, Newport. Commended: Mrs. M. Davies, Harrington, Shifnal.

Colt for agricultural purposes, foaled in 1873.—First prize, £3, J. Paddock; second, £2, B. Wainman, Whitley Manor, Newport. Highly commended: J. Lockley, Little Haors Manor, Newport.

Stallion for hunting purposes.—Prize, £5, A. Bayley, Newcastle-under-Lyme.

ADDITIONAL PRIZES.

Brood mare, with foal at foot.—First prize, a silver cup, 10 gs., C. R. Liddle, Highfield, Newport; second, silver cup, T. Williams, Albrightlee, Battfield, Shrewsbury. Highly commended, W. H. P. Nock, Burlington, Newport. Commended: A. H. Gordon, Brineton, Newport.

Hunter, five years old and upwards, the *bona fide* property of a member of the Society since March, 1874.—First prize, silver cup, 7 gs., and second, 3 gs., R. Ogle, Kinnersley Manor, Wellington. Highly commended: G. Waive, The Rowney Farm, Market Drayton.

Hack or roadster, 15 hands or over.—First prize, £5, T. Radcliffe, and highly commended; second, £2 10s. T. Powell, Cotton Farm, Hodnet.

Cob, hack, or roadster, under 15 hands.—First prize, £5, R. M. Leeke, Longford Hall, Newport; second, £2 10s., J. Deane, Betley, Crewe. Highly commended: R. N. Heane, Newport. Commended: — Kemp, Market Drayton.

Colt, foaled 1870, within the limits of the Society, likely to make a hunter.—First prize, £5, W. Bradburn, Wednesfield; second, £2 10s., G. T. Phillips, Sherifhalls Manor.

Colt, suitable for hack or roadster, foaled 1871.—First prize, £4, W. Davies, Hinstock, Market Drayton; second, £3, J. Bourne. Commended: G. Waive.

Colt, for the same purpose, foaled 1872.—First prize, £3, and second, £2, W. H. P. Nock.

Colt, for the same purpose, foaled 1873.—First prize, £3, H. Jones, Wrockwardine, Wellington; second, £2, M. Lester, Petsy Farm, Hodnet. Highly commended and commended: J. Paddock.

Pony, under 13 hands.—First prize, £2, Mrs. A. Bird and Son; second, £1, J. Attwood. Commended: Mrs. A. Bird and Son.

CATTLE.

SHORTHORNS.

Bull of any age, age to be taken into consideration.—First prize, £7, and silver cup, the Duke of Sutherland, Lilleshall Home Farm; second, £3 10s. T. Williams, Albrightlee, Battfield, Shrewsbury. Highly commended: F. S. Broade, Betley Hall, Crewe. Commended: S. Dicken, Little Ness, Baschurch.

Bull, calved 1872.—First prize, £7, B. Wainman, Whitley Manor, Newport; second, £3 10s., S. L. Horton, Park House, Shifnal. Highly commended: T. Lester, Ollerton, Market Drayton. Commended: R. W. Ralph, Honington Grange, Newport.

Bull, calved 1873.—First prize, £5, W. Bradburn, Wednesfield, Wolverhampton; second, £2 10s., J. Morrey, Sutton, Market Drayton. Highly commended: H. Walker, Lilleshall Hill Farm, Newport. Commended: T. Radcliffe, Cheswell Grange, Newport.

Bull, calved 1874.—First prize, £3, T. Radcliffe; second, £2, W. Bradburn. Highly commended: Rev. W. Sneyd, Keele Hall, Newcastle, Staffordshire. Commended: T. Booker, Sutton, Newport.

Cow, of any age, age to be taken into consideration, having produced a calf in 1874.—First prize, £5, O. Bennion, Cresswell, Stafford; second, £3, Rev. W. Sneyd. Highly commended and commended: W. Bradburn.

Pair of heifers, calved 1872.—First prize, £4, J. Bourne, Arbour Farm, Market Drayton; second, £2, Rev. W. Sneyd. Highly commended: W. Yates, Grindle House, Shifnal.

Heifer, calved 1872.—First prize, £3, S. L. Horton, Park House, Shifnal; second, £2, J. Bickford, Moseley, Wolverhampton. Highly commended: S. Wilkes, Brewer's Oak Farm, Shifnal.

Pair of heifers, calved 1873.—First prize, £3, S. L. Horton ; second, £2, and highly commended, R. Dicken, Aston, Wellington.

Pair of heifers, calved 1874.—First prize, £2, W. Bradburn.

Bull, calved 1872.—First prize £7, W. R. Corser, Moorhouse, Much Wenlock.

Cow, of any age, age to be considered, having produced a calf in 1874.—Prize, £5, M. Williams, Dryton, Wroxeter. Highly commended : E. H. Davies, Patton, Much Wenlock. Commended : R. C. Pooler, Adney House, Newport.

Heifer, calved 1872.—Prize, £4, E. H. Davies. Highly commended : W. R. Corser.

Pair of heifers, calved 1873.—Prize, £3, M. Williams.

ADDITIONAL PRIZES.

Alderney or other Channel Island cow, in milk, having produced a calf in 1874.—First prize, silver cup, value £5, Rev. J. Hill, The Citadel, Hawkestone ; second, £3, Mrs. D. Hudson, Cheswardine Hall, Market Drayton. Highly commended : Rev. J. Hill. Commended : Mrs. D. Hudson.

Cow of any breed for dairy purposes, having produced a calf in 1874.—First prize, £5, J. Bickford ; second, £3, J. Booker, Wilbroughton, Newport. Highly commended : J. Booker. Commended : W. Bradburn.

Fat ox, cow, steer, or heifer.—First prize, £4, Rev. W. Sneyd ; second, £2, E. H. Davies.

SHEEP.

Ram of any age (age to be considered).—First prize, £7, and second, £3 10s., H. Griffin, Fell Wall, Market Drayton. Highly commended : T. Mansell, Ercall-park, Wellington. Commended : E. H. Davies, Patton, Much Wenlock.

Ram, lambed 1873.—First prize, £7, Mrs. S. Beach, The Hattous, Brewood, Staffordshire ; second, £3 10s., W. H. P. Nock, Burlington, Newport. Highly commended : H. Griffin. Commended : T. Nock, Sutton-house, Snifnal.

Ram lamb, lambed 1874.—First prize, £4, Mrs. S. Beach ; second, £2, T. Nock. Highly commended : W. Yates, Grindlehouse, Snifnal. Commended : S. Wilkes, Brewer's Oak Farm, Snifnal.

Twenty ewes, of any age, each having produced a lamb in 1874.—First prize, £10, T. Mansell, Ercall-park, Wellington ; second, £5, Mrs. H. Smith, New-house, Sutton Maddock, Snifnal. Highly commended : M. Williams, Dryton, Wroxeter. Commended : W. Yates, Grindle-house, Snifnal.

Five ewes of any age, each having produced a lamb in 1874.—First prize, £6, Mrs. S. Beach ; second, £3, Mrs. H. Smith. Highly commended : M. Williams, Dryton, Wroxeter. Commended : J. C. Burton Borough, Chetwynd Park, Newport.

Five ewes, lambed in 1873.—First prize, £5, S. Wilkes ; second, £2 10s., W. Yates. Highly commended : T. Mansell. Commended : W. H. P. Nock, Burlington, Newport.

Five ewe-lambs, lambed in 1874.—First prize, £4, Mrs. S. Beach ; second, £2, W. Yates. Highly commended : M. Williams. Commended : W. H. P. Nock, Burlington, Newport ; W. Nevett, Yorton-villa, Shrewsbury.

Long-wool ram of any age (age to be considered).—First prize, £4, and highly commended, J. Wheeler, Long Compton, Shipston-on-Stour, Warwick. Commended : T. Radcliffe, Cheswell Grange, Newport.

Ram lambed in 1873.—Prize, £2, J. Wheeler.

Five ewes of any age, each having produced a lamb in 1874.—First prize, £3, T. Furber, High Offley, Newport.

PIGS.

Boar, large breed, of any age.—First prize £3, J. Wheeler, Long Compton, Shipston-on-Stour ; second, £2, B. Wainham, Whitley Manor, Newport.

Breeding sow, in pig, or with farrow of sucking pigs not exceeding ten weeks old.—First prize, £3, T. Radcliffe, Cheswell Grange, Newport ; second, £2, W. Earp, Lower Bar, Newport. Commended : S. Wilkes, Brewer's Oak Farm, Snifnal.

Boar, small breed of any age.—Prize, £3, J. Wheeler.

Breeding sow, in pig, or with farrow of sucking pigs, not exceeding ten weeks old.—First prize, £3, J. Wheeler ; second, £2, and commended, C. D. Hudson, Cheswardine Hall, Market Drayton. Highly commended : R. Cooke, Chippal, Market Drayton.

Three sows, of any breed, of the same farrow, about four and under eight months old.—First prize, £3, J. Wheeler ; second, £2, T. Radcliffe.

Fat pig.—First prize, £2, J. Wheeler ; second £1, J. Bray, Weston, Snifnal.

EXTRA STOCK PRIZES.

HORSES.

G. H. Haslam, Market Drayton.

CATTLE.

J. Bickford, Moseley, Wolverhampton—white calf (Auy). G. T. Phillips, Sheriffhales Manor, Newport—red-and-white Shorthorn heifer.

CHEESE.

Thick cheese.—First prize, £5, J. Heatley, Old Springs, Market Drayton ; second, J. Bourne, The Arbour, Market Drayton. Highly commended : E. Massey, The Pool Farm, Adderley, Market Drayton.

Thin cheese.—First prize, £5, G. Pierce, Guild Farm, Newport ; second, Mrs. A. Podmore, Chetwynd Grange Farm, Newport. Highly commended : J. Paddock, Chetwynd Aston, Newport. Commended : Mrs. Busby, Houghton Cottage Stafford. The cheese was the manufacture of the exhibitor in the year 1874, was not expressly to show, but a fair sample of the dairy, and not less than 1 cwt.

BUTTER.

First prize, £1, G. Pierce ; second, W. W. Derington, Chetwynd Villa, Newport. Highly commended : Rev. C. F. C. Pigott, Edmond Rectory, Newport. Commended : C. D. Hudson, Cheswardine Hall, Market Drayton.

WOOL.

Five fleeces of Shropshire wool.—First prize, £5, W. Fowler, Acton Reynold, Shrewsbury ; second, J. Broughall, Sutton Maddock, Snifnal ; third, F. Rider, Edgeboulton, Shawbury. Highly commended : W. H. P. Nock, Burlington, Newport. Commended : J. C. Burton, Borough, Chetwynd Park, Newport.

IMPLEMENTS.

1st Class Medals.—W. S. Underhill, Newport, for general assortment ; Corbett and Son, Wellington, for an improved two-horse gear ; Lewis and Co., Shrewsbury, for Emperor combined mower and reaper.

2nd Class Medals.—W. S. Underhill, for six-horse steam engine ; ditto, for six-horse thrashing machine ; Corbett and Son, Wellington, for a R.A.S. grinding mill ; Corbett and Peele, Shrewsbury, for Eclipse combined blowing and winnowing machine ; also for combined corn barrow drill ; A. W. Gower and Son, Market Drayton, for nine-coulter corn drill.

At the dinner, the President, Mr. C. C. COATES, M.P., said, there had been proposals made in certain quarters that societies like that should be merged in a large society which should include in its area the whole of this and possibly one of the adjoining counties. That, however, was not the place for the discussion of that question, but he hoped after the success of the show that day, both as regards the number of people who were present, and the quantity and quality of the stock that was exhibited, that the claims of Newport as a place suitable for holding the show, whether of the North Shropshire or any other agricultural society, would always be fairly and favourably considered. With regard to the present show, he believed that they had good reason to congratulate themselves on the fact that, not only had the North Shropshire Agricultural Society this year held its own, but that it had made a great stride of progress. He had, himself, only seen three shows of the Society ; the first, two years ago, at Wellington, the second, last year, at Market Drayton, and the present show ; and he must say that, whether they regarded the number or the quality of the entries, this show was far superior to any of the Society he had witnessed. The horses and cattle were good, and the sheep classes presented such an appearance as was seldom to be witnessed at a local show. There was one question to which he wished to allude before he sat down, and which had been touched upon earlier in the evening by a gentleman who was well qualified to do so, and whom they always listened to with pleasure, either in public or from the pulpit—the rector of Edmond. It was a question of the very highest importance to the agricultural community, and was occupying a considerable amount of attention at the present time. Happily, so far as he knew, in that district there had been none of those unfortunate disputes which had for some months convulsed almost the whole of the Eastern Counties. He earnestly trusted that no cause for dispute would hereafter arise, but that those amicable relations which had so far existed between employer and employed, those social ties which had hitherto bound them together (more valuable in his opinion than any mere commercial agreement), would be long

maintained, as he considered that if they were carried out in a spirit of equity and fairness both sides would reap the benefit. He did not like to look forward to the prospect of any such differences arising, and he hoped that that day might be far distant. But should they unfortunately arise, and disputes should take place between employer and employed, he earnestly hoped that both sides would be wise enough to be guided by their own counsels without having recourse to those who came from a distance, and who were, to say the least of it, imperfectly acquainted with the facts of the case. He had been very much struck by the fact that in the recent dispute in the Eastern Counties, gentlemen, eminent in the mercantile world, had come forward to speak authoritatively on the agricultural labourers' question, with which they could have no practical acquaintance. He thought that were the cases reversed and were he and his friends to take part in matters which affected the mercantile interest they would at once be told that they knew nothing of the matter with which they were attempting to deal. Now that the struggle was over he hoped that the conquerors would use their victory with moderation, and that, as far as possible, the kindly feeling which had previously existed would return, and that no business or spirit of retaliation would be shown by either side in the future.

Mr. ORMSBY GORE, M.P., had never seen a better show of

sheep—the rams were fine, and so were the ewes, while the lambs were more than fine. He was glad to see the crops were so good in this neighbourhood, and in Wales he had never seen finer crops than they had had this year. With reference to the malt, he might say he had had a conversation with Mr. Bass, M.P., and that gentleman assured him that there would be good returns of barley this year. With reference to the proposed amalgamation of this Society with others, or with the merging of it into a general society for the county, he did not agree. If it was desirable there should be a society of the latter description, well and good; but why should the existence of such a society interfere with the existence of the North Shropshire as a district Society? Seeing the district Society had done so much good, let them continue, rather than give it up.

Lord NEWPORT, M.P., said there was one thing the Chancellor of the Exchequer had refused to deal with, and which he himself would like to have seen repealed—the Malt-tax. [Mr. Mansell: "We want it off."] He was pleased with the abolition of the horse-duty, for that would be a great boon to agriculturists. The recent legislation with regard to local taxation would also be welcomed by the agricultural community, and he might say that her Majesty's minister's had been advised, in another session, to deal with the question in general.

NORTHALLERTON AGRICULTURAL SOCIETY.

Horses and cattle were not as largely represented as usual. The roots were quite a feature of the exhibition, forming the best show of the kind come across this season. Horses included a representation of the best animals in the North Riding, and for the cup given by the member for the borough there was a keen competition, the class including some well-known prize-winners.

PRIZE LIST.

HORSES.

HUNTERS.

Colt foal for the field.—First prize, T. Heugh, Romanby Farm, Northallerton; second, W. Clarke, Asenby, Thirsk.

Filly foal for the field.—First prize, R. Mothersill, Brockholme, Northallerton; second, J. and H. Ward, Fairholm, Northallerton.

Yearling gelding for the field.—First prize, G. Lancaster, Morton Grange, Northallerton; second, T. and G. Knowles, Windy Hill, Hutton, Rudby, Yarm.

Yearling filly for the field.—First prize, J. Weighell, Whiteby; second, G. Potts, Greenhow Hill, Great Ayton, Northallerton.

Two years old gelding for the field.—First prize, J. Sedman, Wilton, Pickering; second, T. H. Hutchinson, Manor House, Catterick.

Two years old filly for the field.—First prize, T. H. Hutchinson; second, T. and G. Knowles.

Three years old geldings for the field.—First and second prizes, G. Lancaster.

Three years old for the field.—First prize, A. Brigham, Settrington, York; second, M. Raw, Piercebridge Grange, Darlington.

COACHING.

Colt foal.—First prize, W. Sidgwick, Knowles Farm, Kirk-leavington; second, J. Wood, Park House, Gilling, York.

Filly foal.—First prize, J. Pattison, Brompton; second, J. Reader, Beacon Farm, Holme, York.

Yearling gelding.—First prize, W. Watson, Cockerton, Darlington; second, G. Lancaster.

Yearling filly.—First prize, J. Campion, Overdale Farm, Lythe; second, J. Pattison.

Two years old gelding.—First prize, J. Smith, Gyll Hall, Catterick; second, G. Meynell, Warule House, Patrick Brompton, Bedale.

Two years old filly.—First prize, C. and J. Smith, Broadgate, Westerdale, Yarm; second, J. and J. Welford, Newton Mulgrave, Hinderwell, Saltburn.

Three years old gelding.—First prize, T. Phummer, Birdforth, Easingwold; second, I. Scarth, Mount Pleasant, West Rounton.

Three years old filly.—First prize, J. and F. Hill, Nether Silton, Northallerton; second, T. Dobson, Easington, Saltburn.

ROADSTERS.

Colt or filly.—First prize, E. Shepherd, Aiskew, Bedale; second, A. Kirby, High Grange, Market Weighton.

Yearling gelding or filly.—First prize, Kirby, R. Kirby Sigston, Northallerton; second, W. Dixon, Sharow, Ripon.

Two years old gelding or filly.—First prize, M. Harrison, Water, Pocklington; second, M. Morton, Leak Hall, Thirsk.

Three years old gelding or filly.—First prize, T. Foster, Allen's Grange, Piercebridge, Darlington; second, R. Kirby, Kirby Sigston.

AGRICULTURAL PURPOSES.

Colt or filly foal.—First prize, T. Pick, Street House, Newsham, Thirsk; second, Mrs. Kitchen and Sons, Whorlton, Swainby Stokesley.

Yearling gelding or filly.—First prize, Mrs. Kitching and Sons; second, T. Potts, Swaiaby Mill, Northallerton.

Two years old gelding.—First prize, W. Kitching, Summerfield; second, D. Sanderson, Richmond.

Two years old filly.—First prize, W. Appleton, Balk; second, W. Wilkinson, South Kilvington.

Three years old gelding.—First prize, R. Lee, Ferryhill; second, R. Tweedie, Catterick.

Three years old filly.—First and second prizes, Mrs. Heddon, Baldersby.

Pair of horses of either sex.—First prize, T. H. Hutchinson; second, Mrs. Heddon.

BROOD MARES.

Mares for breeding hunters, with a foal or stunted.—First prize, W. Johnson, Bagby; second, W. Clarke, Asenby.

Mare for breeding coach-horses, with a foal or stunted.—First prize, M. Robinson, Hauxwell; second, J. Reader, Holme.

Mare for breeding roadsters, with a foal or stunted.—First prize, A. Kirby, Market Weighton; second, H. R. W. Hart, York.

Mare for breeding agricultural horses, with a foal or stunted.—First prize, R. Watson, Stockton-on-Tees; second, T. H. Hutchinson.

SPECIAL DISTRICT PRIZE.

Mare for breeding agricultural horses, with a foal or stunted.—Prize, J. Smith, Northallerton.

HORSES TO BE RIDDEN IN THE RING.

HUNTERS.

Four years old gelding or mare.—First prize, D. and R. Batty, Helperby; second, T. Darrell, West Ayton; third, T. H. Hutchinson.

SPECIAL PRIZE.

Hunter, gelding, or mare, not exceeding eight years old, by a thorough-bred horse, capable of carrying 14 stones with hounds, and that has been regularly hunted with an established pack of foxhounds in the counties of Yorkshire or Durham.—First prize, Cup, T. H. Hutchinson; second, D. and R. Batty; third, T. Darrell.

HACKNEYS.

Hackney mare or gelding, under eight years old.—First prize, W. H. Blackman, Wressle; second, W. Stephenson, Cottingham.

PONIES.

Pony not exceeding 14 hands.—First prize, W. H. Blackman; second, Viscount Castlereagh, Stockton-on-Tees; third, Mrs. Barnes, Warlaby Lodge.

CATTLE.

SHORTHORNS.

Bull, above two years old.—First prize, G. Yeates, Studley, Ripon; second, I. Garbutt, Farudale.

Bull, above one and under two years old.—First prize, C. and J. Smith, Broadgate, Yarm; second, N. Russell, Northallerton.

Bull, calf, under twelve months old.—First prize.—H. Clay, Northallerton; second, E. and W. Dovener, Bedale.

Cow, in calf or milk, having had a calf within twelve months.—First prize, T. H. Hutchinson, Catterick; second, T. H. Hutchinson.

Heifer, under three years old, in calf or milk.—First prize, T. H. Hutchinson; second, H. Clay.

Heifer, under two years old.—First prize, T. H. Hutchinson; second, T. Strickland, Thirsk Junction.

Heifer, under twelve months old.—First prize, T. H. Hutchinson; second, W. White, Bedale.

DISTRICT PRIZES.

Cow, in calf or milk, having had a calf within twelve months.—First prize, G. K. Harland, Northallerton; second, N. Russell.

Heifer, under three years old, in calf or milk.—First prize, T. Strickland; second, W. White.

Heifer, under two years old.—First prize, T. Strickland; second, H. Clay.

Heifer, under twelve months old.—First prize, W. Bearpark, Ainderby Steeple; second, C. Wailles, Northallerton.

A cup, given by Mrs. Elliot, for the best heifer exhibited and bred in the district.—Prize, H. Clay.

DAIRY COWS.

Cow for dairy purposes, in calf or milk.—First prize, G. K. Harland, Northallerton; second, R. Kirby and Son, Northallerton; third, J. B. Braithwaite, Northallerton.

Cow for dairy purposes, the property of a cottager.—First prize, J. Wilson, Thirsk; second, T. Gill, Thirsk.

FAT BEASTS.

Fat beast.—First prize, M. and W. Boville, Ormotherley; second, M. and W. Boville.

SHEEP.

LEICESTERS.

Ram, one shear.—First prize, T. H. Hutchinson; second, T. H. Hutchinson.

Ram, aged.—First prize, T. H. Hutchinson; second, R. Tarbotton, York.

Tap lamb.—First prize, R. Harrison, Richmond; second, R. Harrison.

Pen of five ewes, having suckled lambs in 1874.—First prize, T. H. Hutchinson; second, E. and W. Dovener.

Pen of five gimmer shearlings.—First prize, T. H. Hutchinson; second, R. Tarbotton.

Pen of five gimmer lambs.—First prize, T. H. Hutchinson; second, R. Tarbotton, Corton.

OTHER LONGWOOLS.

Ram, one shear.—First prize, R. Harrison; second, F. Heugh, Northallerton.

Ram, aged.—First prize, F. Heugh; second, G. Lancaster, Northallerton.

LEICESTERS OF LONGWOOLS.

District Prizes.

Ram, aged.—First prize, F. Heugh; second, E. and W. Dovener.

Ram, one shear.—First prize, E. and W. Dovener; second, F. Heugh.

Tap lamb.—First prize, W. Clapham, West Harsley, Northallerton; second, W. Clapham.

Pen of five ewes, having suckled lambs in 1874.—First prize, W. Hall, Thirsk; second, E. and W. Dovener.

Pen of five gimmer shearlings.—First prize, E. and W. Dovener; second, Thomas Carter, Thirsk.

Pen of five gimmer lambs.—First prize, T. Kirby, Northallerton; second, Thomas Carter.

Pen of five fat sheep.—First prize, W. Robinson, Morton-on-Swale; second, W. Robinson.

PIGS.

Boar, large breed.—First prize, J. Wilson, Rainton, Thirsk; second, D. Sanderson, Richmond.

Boar, small breed.—First prize, T. Strickland; second, D. Sanderson.

Sow, large breed, in pig or milk.—First prize, J. Tutin, Brompton Moor, Northallerton; second, J. B. Braithwaite, North Otterington, Northallerton.

Sow, small breed, in pig or milk.—First prize, D. Sanderson; second, George Hamilton, Northallerton.

Fat pig.—First prize, D. Sanderson; second, T. Strickland.

Pig, the property of a cottager, being a householder, whose total rental does not exceed £8 per annum.—First prize, Thomas Dickens, Romanby; second, James Eden, Thirsk; third, John Thackeray, Yafforth.

SPECIAL PRIZE.

Black pig, the produce of his breed.—Prize, Thomas Dickens.

ROOTS.

Six swede turnips grown by exhibitor.—First prize, G. Oliver, Northallerton; second, T. C. Booth, Warlaby.

Six turnips, any other variety, grown by exhibitor.—T. C. Booth; second, R. Leak, Bedale.

Six mangolds grown by exhibitor.—First prize, T. Pick, Thirsk; second, Hon. G. E. Lascelles, Thirsk.

Twelve kidney potatoes grown by exhibitor.—First prize, W. Harker, Northallerton; second, G. J. Hinchcliffe, Northallerton.

Twelve round potatoes grown by exhibitor.—First prize, R. Leak; second, W. Bell, Thornton-le-Moor.

Collection of roots grown by exhibitor.—First prize, W. Shipley, Thornton-le-Moor; second, G. J. Robinson, Thirsk.

SPECIAL PRIZES: Twelve swede turnips.—Prize, J. and H. Ward, Northallerton.

Collection of roots.—Prize, G. Lancaster, Northallerton.

Collection of roots.—First prize, J. S. Atkinson, Northallerton; second, G. Lancaster; third, W. Shipley.

LONG SUTTON AGRICULTURAL SOCIETY.

PRIZE LIST.

JUDGES.—HORSES: W. Barber, Routh, Beverley; L. Nicholson, Gosterton, Spalding; C. Banks, Holbeach Marsh. BEASTS, SHEEP, and PIGS: J. Parish, Toynton, Spilsby; C. Mason, Beechamwell, Swaffham, Norfolk. IMPLEMENTS and ROOTS: S. W. Campaign, Deeping St. Nicholas; J. A. Clarke, Long Sutton Marsh.

HORSES.

Cart stallion.—First prize, J. Tomlinson, Lut'on Marsh, Long Sutton; second, R. Kihham, Folley, Long Sutton. Cart mare, with foal.—First and second prize, J. Tomlinson.

Pair of draught geldings or mares.—First prize, J. Tomlinson; second, W. and G. Horn.

Two-year-old cart gelding.—First prize, F. Howard, the Crosses, Long Sutton; second, L. Egar, Wryde, Thorney.

Two-year-old cart filly.—First and second prize, W. and G. Horn.

Cart foal.—First prize, J. Cropper, Long Sutton; second, J. Tomlinson.

Hackney stallion.—First prize, W. Giddens, Hill House, Walpole, Wisbech; second, T. Upton, Gosberton.

Hackney horse or mare, not under 14 hands 2 inches.—

First prize, W. Giddens; second, E. B. Bettinson, Manor House, Gedney.

Harness horse or mare, not under 14 hands 2 inches.—First prize, J. Baker, Wisbech; second, S. Campaign, jun., Deeping St. Nicholas, Spalding.

Gelding or mare, over 13 hands and under 14 hands 2 inches.—Prize, W. Johnson, Walpole, Wisbech.

Pony, not exceeding 13 hands.—Prize, G. Snarey, jun., Old Market, Wisbech.

Hunter, not under four years old.—First prize, J. G. Hobson, Long Sutton; second, S. S. Mossop, Long Sutton.

CATTLE.

Bull, any age.—First prize, C. Beart, Stow Bardolph, Downham Market; second, T. Y. Sindall, Fulney Hall, Spalding.

Cow in-calf, or in-milk.—First prize, W. Johnson; second, J. H. Barker, Holbeach.

Heifer in-calf or milk, not exceeding three years old.—First and second prize, W. Johnson.

Pair of steers, not exceeding two years old.—First prize, W. Wright, Lutton; second, W. Naylor, Long Sutton.

Pair of fat oxen, cows, or heifers.—Prize, J. Bett, Holbeach.

Heifer, not exceeding two years old.—First prize, R. Parker, North Creake, Fakenham; second, W. Wright.

Heifer calf, under twelve months.—Prize, W. Wright.

SHEEP.

Five longwooled breeding ewes, any age.—First and second prize, W. Wright.

Five longwooled shearling ewes.—First and second prize, W. Wright.

Five shearling wethers.—First prize, J. Cooke, Pode Hole, Spalding; second, G. Bettinson, Lutton.

Five heder lambs.—First prize, Mrs. Portugal, Tydd, St. Giles, Wisbech; second, W. Webster, Gedney Marsh.

Five ewe lambs.—First prize, Mrs. Portugal; second, G. Fletcher, Holbeach Hurn.

Extra class.—First prize, J. Cooke; second, H.R.H. the Prince of Wales, K.G., Sandringham.

PIGS.

Boar, small breed.—First prize, T. Y. Sindall; second, H. A. Kilham, Tydd St. Mary.

Sow in-pig or suckling, large breed.—Prize, H. A. Kilham.

Sow in-pig or suckling, small breed.—Prize, H. A. Kilham.

Three pigs, under six months old.—Prize, W. J. Wright, Lutton.

Extra class.—Prize, G. and R. W. Oldershaw, Gedney Marsh.

ROOTS.

Ten swede turnips.—Prize, W. Wright.

Ten long mangolds.—Prize, J. G. Hobson, Curlew Lodge, Long Sutton.

Ten globe mangolds.—Prize, J. T. Bettinson, Gedney, Long Sutton.

Ten kohlrabi.—Prize, J. Snashall, Fleet.

Ten drumhead cabbages.—Prize, J. C. Anderson, Long Sutton, Marsh.

Peck of potatoes, any kind.—Prize, G. Clarke, Lutton Marsh.

IMPLEMENTS.

Stand of implements.—Prize, Barford and Perkins, Peterborough.

General purpose drill.—Prize, Barford and Perkins.

Set of harrows.—Prize, C. Hardy, Lutton.

THE ROYAL AND CENTRAL BUCKS AGRICULTURAL ASSOCIATION.

MEETING AT AYLESBURY.

Amongst the Shorthorns Mr. J. A. Mumford was first in the bull class with his Notley, which last year was second; in the class of bulls under two years the first prize went to a bull belong to Mr. Sharp, of Kettering; in the class of single cows in milk or in calf, Mr. T. L. Senior's Devon Moss Rose was first in a good entry of eight. For the three cow prizes, Mr. J. A. Mumford and Mr. T. Kingsley took first and second, while for in-calf heifers Mr. T. Hewer's Shorthorn Huntress and Mr. Senior's Moss Rose were the best, the Shorthorn standing first. In the class of heifers, in pairs, under two years, Mr. Mumford's pair obtained first prize and Mr. J. Sharpe the second, with a third pair shown by Mr. J. Denchfield highly commended. In the two fat cattle classes the entries were not numerous, and Mr. Senior carried off the first prize for fat cows and both for oxen; the two steers were one Devon and the other half-bred. The competition in the sheep classes was not so large. In the ram class there were six entries, and Mr. John Treadwell took the first prize, his most formidable competitor being Mr. George Street, of Maulden, who came second; and was first in store ewe lambs for breeding purposes, as also in those for fat shearlings and breeding heaves. The cup for the best pen of breeding ewes or heaves, and likewise the cup for the best pen of sheep in the yard, were also both awarded to Mr. Street, who has this year competed at these shows for the first time. The pig classes also were not very largely filled. Mr. J. Wheeler won the first prize for boars, while the second was taken by Mr. Bulford, of Winchendon. In the two sow classes, Mr. R. Fowler carried off both prizes for Berkshires, and Mr. J. Wheeler for any other breed, while the fat pig prizes were awarded, the first prize to Mr. Biggs, of Cublington, and the second to Mr. Elliott, of Hulcott. For cart stallions two valuable cups, presented by Sir A. de Rothschild, attracted a total of fifteen

entries; and the judges awarded the first prize to Nonpareil, a five-year-old chestnut, shown by Mr. John Manning, of Oringbury; with the second prize to Mr. W. Coles's King Lincoln. Mr. E. Denchfield won for working horses, as he did also for mares and foals; and there was a good entry of cart yearlings, the first prize falling to Messrs. Richman, of St. Ives. In the hunter class there were nine entries, Mr. C. Elliott, of Hulcott, standing first, and Mrs. White, of Pollicott, second. Of the remaining horse classes, the nags had an entry of fourteen, and Mr. J. Tompkins, of Ivinghoe, stood first; while Mr. Lepper was the winner of Baroness M. A. de Rothschild's cup for the best yearling nag colt, with a son of Rapid Roan. Despite the exceedingly unfavourable season for root cultivation, Thursday's show produced a very creditable entry.

PRIZE LIST.

JUDGES.—PLOWING AND PIGS: W. Hawkes, Thenford, Bumbury; W. Denchfield, Banbury. HORSES: J. K. Elliott, Heathcote, Towcester; T. Berridge, Ratley, Kington, Warwick; — Plowright, jun., The Hall, Finchbeck, Lincoln. CATTLE: M. Savidge, Sarsden Lodge Farm, Chipping Norton; C. Hobbs, Maisy Hampton, Cricklade. SHEEP: A. F. Milton Druce, Twelve Acres, Eynsham; G. Bagnall, Westwell, Burford. BUTTER: H. Pybus, jun., 16, Charterhouse-lane, London. ROOT CROPS: J. Crouch, Court Farm, Aylesbury; H. Fowler, Broughton. ROOTS: J. Crouch; C. Elliott, Hulcott.

HORSES

FOR AGRICULTURAL PURPOSES.

Cart stallions, 3 years old and upwards; the winners of the first and second prizes to remain at Aylesbury at least three nights in each week during the ensuing season. Members of the Association to have the privilege of sending mares to be served at the rate of £1 11s. 6d. each, including groom's fee.—First prize, £50, J. Manning, Oringbury, Wellingborough; second, £25, W. Coles, Long Crendon. Commended: S. Davies, Woolashill.

Geldings, three years old and upwards.—First prize, a silver cup or piece of plate, value £5 5s., J. P. Terry, Pultowes; second, £2. Commended: J. P. Terry.

Geldings, under three years.—First prize, a silver cup or piece of plate, value £5 5s., W. B. Clark, Uppings, Weedon; second, £2, E. J. Clift, Weedon. Commended: J. Hughes, Stone.

Mares, over three years.—First prize, a silver cup or piece of plate, value £5 5s., E. Denchfield, Burston; second, £2, E. Terry, Buckingham-road, Aylesbury. Commended: E. Terry.

Mare and foal.—First prize, a silver cup or piece of plate, value £5 5s., E. Denchfield; second, £2, W. R. Rowland, Creslow. Commended: T. Birdsey, Leighton Buzzard.

Mares, under three years.—First prize, a silver cup or piece of plate, value £5 5s., W. and J. Rose, Eythrops; second, £2, J. Hughes, Stone. Commended: Harris and Biggs, Cublington.

Yearling cart colt or filly.—First prize, a silver cup, value £10 10s., H. Reynolds, The Dover, Dauntsey, Chippingham; second, £2, J. R. Simons, Berryfield. Commended: W. R. Rowland.

Horses or mares, for hunting purposes.—First prize, a silver cup or piece of plate, value £7 7s., C. Elliott, Hulcott; second, £3 3s., Mrs. M. White, Pollicott. Commended: W. Hawkins, Edlesborough.

Nag geldings and mares, for riding and general purposes.—First prize, £5, J. Tomkins, Ivinghoe; second, £2, J. P. Terry, Putlowes. Commended: Mrs. M. White.

Hunters.—First prize, a silver cup or piece of plate, value £21, J. Pettit, Leighton Buzzard; second, £5 5s., W. Hawkins. Commended: T. Pain, Lower Pertwood, Hindon, Wilts.

Sucking colt or filly.—For the best sucking colt or filly, by either of the Vale of Aylesbury Horse Company's horses—Prize, a silver cup, value £10 10s., E. J. Clift, Weedon.

A silver cup, value £10 10s., for the best cart-horse or mare in the show yard, was awarded to W. B. Clark, Uppings.

A silver cup, for the best yearling nag colt, G. A. Lepper, Aylesbury. Commended, J. Denchfield.

CATTLE.

Bulls, any breed, two years old and upwards.—First prize, a silver cup or piece of plate, value £5 5s., J. A. Mumford, Chilton; second, £2, T. Kingsley, Boarscraft. Commended: G. Underwood, Little Gaddesden.

Bulls, under two years.—First prize, a silver cup or piece of plate, value £5 5s., J. J. Sharp, Broughton, Kettering; second, £2, T. Hewer, Hylesham, Lechdale. Highly commended: J. Denchfield, Burston. Commended: J. A. Mumford, Brill.

Cows, in milk or in calf.—First prize, a silver cup or piece of plate, value £5 5s., T. L. Senior, Broughton House, Aylesbury; second, £2, J. J. Sharp. Highly commended: J. Denchfield; T. Kingsley, Boarscraft.

Three cows, in milk or in calf.—First prize, a silver cup or piece of plate, value £10 10s., J. A. Mumford, Chilton; second, a silver cup or piece of plate, value £5 5s., T. Kingsley. Highly commended: J. Denchfield.

Heifers, in milk or in calf, under three and over two years.—First prize, a silver cup or piece of plate, value £5 5s., T. Hewer; second, £2, T. L. Senior. Highly commended: F. R. Denchfield, Aston Abbots. Commended: F. R. Denchfield.

Heifers, in pairs, under two years.—First prize, a silver cup or piece of plate, value £5 5s., J. A. Mumford; second, £2, J. J. Sharp. Highly commended: J. Denchfield.

Fat heifers or cows.—First prize, a silver cup or piece of plate, value £5 5s., T. L. Senior; second, £2, R. Fowler, Broughton.

Oxen (any breed).—First prize, a silver cup or piece of plate, value £5 5s., T. L. Senior; second, £2, T. L. Senior. Commended: T. Taylor, Aston Rowant.

EXTRA STOCK.—Commended: T. L. Senior (Devon ox), H. Wyatt, Walton, Aylesbury (heifer).

A silver cup, value £5 5s., for the best animal, bred by the exhibitor, exhibited in the classes of horned stock, was awarded to T. L. Senior.

A silver cup or piece of plate, value £10 10s., to the best horned animal in the yard, being the property of a tenant-farmer within twelve miles of Aylesbury, was taken by J. A. Mumford, Chilton.

SHEEP.

Rams, any breed.—First prize, a silver cup or piece of plate, value £5 5s., J. Treadwell, Upper Winchendon; second, £2 2s., F. Street, Harrowden House, Bedford.

Five store ewe lambs, for breeding purposes.—First prize, a silver cup or piece of plate, value £5 5s., G. Street, Maulden, Amptill; second, £2, G. Street. Highly commended: F. Street.

Five fat ewes, any breed or age.—First prize, a silver cup or piece of plate, value £5 5s., J. Treadwell; second, £2, R. Fowler, Broughton.

Five fat shearlings.—First prize, a silver cup or piece of plate, value £5 5s., G. Street; second, £2, Z. W. Stilgoe, Adderbury Grounds, Banbury.

Five ewes, of any breed, intended for breeding purposes.—First prize, a silver cup or piece of plate, value £5 5s., N. Stilgoe; second, £2, R. Fowler. Commended: E. Denchfield, Burston.

Five theaves, any breed, intended for breeding purposes.—First prize, a silver cup or piece of plate, value £5 5s., G. Street; second, £2, G. Street. Highly commended: F. Street.

Ten ewes, for breeding purposes, any breed.—Prize, a silver cup or piece of plate, value £5 5s., J. P. Terry, Putlowes. Highly commended: E. Terry, Buckingham-road, Aylesbury.

Ten ewe lambs, any breed.—Prize, a silver cup, value £5 5s., J. F. Perkins, Chilton.

A silver cup, value £5 5s., to the owner of the best pen of breeding ewes or theaves in the yard, was awarded to G. Street.

A gold pencil-case, value £3, to the owner of the best pen of fat sheep, was taken by G. Street.

Best pen of sheep in the yard.—Prize, a silver cup or piece of plate, value £5 5s., G. Street.

PIGS.

Boars of any breed.—First prize, £3 3s., J. Wheeler, Long Compton, Shipton-on-Stour; second, £2, R. Fowler, Broughton. Highly commended: J. Bulford, Upper Winchendon.

Sows, Berkshire, either in pig or with litter, of which the young pigs shall not be over eight weeks old.—First prize, a silver cup or piece of plate, value £5 5s., and second, £2, R. Fowler. Commended: E. D. Lee, Hartwell House.

Sows of any breed.—First prize £3 3s., and second, £2, J. Wheeler. Commended: P. Payne, jun., Walton, Aylesbury.

Three fat pigs.—First prize, £3 3s., J. Biggs, Cublington; second, £2, C. Elliott, Hulcott.

BUTTER.

Twelve pounds of butter, in 2lb. lumps.—First prize £3 3s., A. Roads, Rowsham, dairymaid £1; second, £2 2s., R. Fowler, dairymaid 10s. Highly commended: T. Matthews, Waddesdon. Commended: J. R. Simonds, Berryfield.

ROOTS.

For the best crop of mangold wurtzel, of not less than three acre (the whole of the mangolds on the farm to be taken into consideration).—First prize, a silver cup or piece of plate, value £7 7s., E. Denchfield, Burston; second, £3 3s., T. Birdsey, Leighton Buzzard.

To the member who shall grow the best crop of mangold wurtzel of not less than three acres, within 12 miles of Aylesbury.—Prize, a silver cup or piece of plate, value £5 5s., E. Denchfield, Burston.

To the member who shall grow the best crop of Swedish turnips, of not less than five acres, within 12 miles of Aylesbury.—Prize, a silver cup or plate, value £5 5s., E. Freeman, Chilton.

For the best crop of swedes, of not less than six acres (the whole of the swedes on the farm to be taken into consideration), for tenant-farmers only, within 12 miles of Aylesbury.—First prize, a silver cup or piece of plate, value £7 7s., J. P. Parrott; second, £3 3s., J. Bulford, Upper Winchendon.

Collection of not less than four varieties, to include Sutton's new Golden Tankard Yellow Fleshed Mangolds.—Prize, a silver cup, value £5 5s., J. Bates, Aylesbury. Highly commended: T. Birdsey, Leighton Buzzard.

Twenty-five mangolds, taken from a piece of not less than two acres.—First prize, £2, E. Denchfield; second, £1, O. Hatton, Chinnor. Reserved: J. Bates, Aylesbury. Commended: J. H. Guy, Whitechurch.

Twenty-five swedes, taken from a piece of not less than two acres.—First prize, £2, J. H. Guy; second, £1, J. H. Guy.

At the dinner, Mr. J. K. FOWLER said: The House of Commons had a great deal to do, notwithstanding that the past one had been called a barren session, and perhaps before the next one there would be no harm in their learning the opinions of their constituents upon some of the legislation which might have to be dealt with by them. It was not for him to introduce general politics at the meetings of that association, but there were certain questions of agricultural politics which they had a perfect right to discuss on these occasions, which were the only ones they had of communicating their views to their members. One of the first of those agricultural questions was Tenant-Right. It was all very well to try to put that down, but it must and would come to the front sooner or later, and would have to be considered. He rejoiced that they had in the present Government a gentleman, Mr. Clare Read, who was a great champion of the farmers, which ought to be an earnest that their claims would be considered by the Ministry of which he was a member. It was to be regretted that they had lost the parliamentary services of Mr. James Howard, for he and Mr. Read were in themselves a power second to none in the House of Commons; and their opinions were shared by farmers throughout the length and breadth of the land. It was said by many who supported the Tenant-Right Bill, that the great cause of opposition to it was the twelfth clause, and that that clause would have to be altered. He believed, however, that both the farmers of this neighbourhood and of every county in England were of opinion that in any efficient Tenant-Right Bill that clause must be maintained, though his friend John Treadwell and he had differed upon it on several occasions. It was quite true that tenants might remain under the same landlord all their lives, but if they were tenants at will they were always liable to be turned out, of which what occurred on the very estate on which Mr. Treadwell was tenant was an instance. The property had changed hands, and Mr. Treadwell and all the other farmers upon it might have had notice to quit, if it had not fallen into the hands of one of the best families in this kingdom or any other. The estate might have been purchased by some northern manufacturing millionaire, whose only thought was to screw as large an interest as he could on his investment, and therefore both its tenants and the neighbourhood might congratulate themselves upon the coming amongst them of another member of a family whose kindness and liberality were so well known throughout the district. He contended, however, for all that, that that the tenant-farmers would never be in the position they ought to be so long as they were liable, at six months' notice, to be turned out of their farms without compensation for any improvements they might have made in them. He asked the gentlemen who were now present, and who were representatives of both the great political parties, to give this subject their careful attention, for he was quite sure it deserved it. Then there was the labour question. That was, perhaps, hardly a subject for legislation, but it had forced itself upon them. For his own part he thought the labourers had been down-trodden too long, and that their wages had been too small. He thought that the great rise which had taken place in the value of money during the last twenty years should also have raised the value of labour, and therefore the question was a pressing and important one, even though it one with which the legislature could have little to do directly. As, however, it had been proposed by one of the members of the county to introduce Mr. Arch to members of the then Government, it was evident that he must have received some support from those members themselves, and he would ask them to give the same attention to the labour subject as they would give to others.

Mr. M. N. DE ROTHSCHILD, the chairman, said his friend Fowler, as they all knew, was much in the habit of riding his hobby to death—sometimes the Malt-tax—sometimes compensation to farmers. After all, however, agriculture in England was flourishing, as it flourished in no other country. As a proof he would point to those agricultural implements which farmers did not now know how to dispense with. He doubted if in any other part of the world the science of agriculture had made the strides it had in this country, or was upon the whole so flourishing. A great many loose statements had been made lately about the waste lands of the country, and it was said that these waste lands were held by the landlords and kept out of cultivation for their own purposes. He had looked over the blue books and found the statistics upon that subject required some consideration. They had been told

that there were seven millions of acres of waste lands in the kingdom, of which five millions were in the six northern counties. In reality, however, there were not more than four millions, the remainder being occupied by houses and gardens, in towns, and by-roads, hedges, railways, and canals. He mentioned this because it always struck him that the proposal to cut up the country into small farms and allotments would not, after all, tend to increase the actual productiveness of the soil, but, on the contrary, would rather diminish it.

Mr. J. TREADWELL was emphatically what his friend Mr. Paxton would call "a showman," for he believed thoroughly in agricultural shows. He knew some farmers were of a different opinion, but he would ask them how any man could look into the showyard, and see the competing animals, without coming to the conclusion that competition must of necessity tend to improve the stock of the district. He believed when people went to a show, and there saw animals calculated to improve their own stock, they would be induced to purchase them for that purpose, and he was certain that since these shows had become so numerous, stock had been very much improved. He could not believe when they saw those Shorthorns, and sheep, and pigs, they would not themselves like to possess them, and be induced to make exertions to equal, and if possible, surpass them in the animals on their own farms. That was in his opinion one of the great advantages of these shows. There was another way in which agricultural shows did good. They brought together the farmers and gentlemen of the district. He always rejoiced to see the country gentlemen present, especially when they were of the right sort, and should have been very much pleased if they had had more at the present meeting. He was not going to follow his friend Fowler into matters which he thought had better be discussed elsewhere, but there was one thing which was worth touching upon, and that was the question of waste lands. From what he had seen of the returns on that subject, he thought they were most fallacious and misleading. Only lately he had seen in a return of the waste lands in this county, a statement of waste lands in a parish where he knew they had been enclosed and in cultivation for years and years. If one item was wrong, others might be wrong also, and the return would be really worth nothing at all. He was glad the President had mentioned that subject, because it gave him an opportunity of saying a few words on it, and of expressing the opinion that the sooner all ideas derived from those returns were exploded, the better.

Mr. G. STREET did not know that anything gave him more pleasure than the success of his men in the competition for the prizes for length of servitude. They had taken about £25 for length of service within little more than a week. When so much had been said about the way in which farmers treated their men, that was a fact which gave him special pleasure. Those men had attended this show, two of them all the way from Malden, at some inconvenience to himself, to receive the prizes the Bucks Association had so liberally offered. He had also been much pleased with some of the remarks which had been made about waste land. They had heard a great deal about waste lands, and a good deal had been said about Government taking them into its own hand, and allotting them for cottage cultivation by the labourers. It was said by that means a larger amount of crops would be raised for the benefit of the nation, but he had a most decided view that there was no country in Europe better cultivated than England, and he believed under no system of land management would it be likely to produce more.

A HARVEST FESTIVAL.—The Rev. C. C. Sharpe, vicar of Bucknell, Shropshire, was charged before the county magistrates at Bishop's Castle, with having at a harvest festival for his parish sold ale as a snapper which took place in the schoolroom. On the 9th September Mr. Sharpe had thanksgiving services in his church in the morning, and in the evening a supper took place. Tickets were sold at half-a-crown each, and during and after the supper the guests were supplied with ale. For the defence it was alleged that Mr. Sharpe was ignorant of the law, and that if he had broken it at all, he had not done it wilfully or with the object of making a profit out of the sale of the beer. The defendant was ordered to pay a fine of 1s. and 12s. costs, and the chairman said he thought the charge a bit of sharp practice.

THE DERBYSHIRE AGRICULTURAL SOCIETY.

MEETING AT DERBY.

There were a good many vacancies in some of the cattle classes, which it is supposed were owing to the prevalence of the foot-and-mouth disease. A fat ox, shown by Mr. Towle, of Draycott Hall, was the prominent feature of the show. The horses were numerous, and the hunter, hack, and harness classes were well filled; three classes being specially commended by the judges. The show of dairy stock was small, with only four competitors for the three prizes for lots of four cows, and one in the pairs of dairy cows. Mr. Chamberlain took first prize with a good bull and three useful dairy cows, and Mr. J. Langley second. There was a fair show of sheep, both of long and shortwoolled; and amongst the latter Mr. Baker stands pre-eminent with his Shropshires. He was first and second in breeding ewes, first and third in the theaves, first in the ewe lambs, the only exhibitor in the aged rams, third in the shearings, and first and second in the ram lambs. Of pigs the entries were not sufficient to fill all the pens allotted to the departments; and the entries of cheese were scarcely equal in number to former years. For factory cheese the judges awarded the prize to the cheese made at Mickleover, and two guineas were given to each of the factories at Derby and Longford, and one to the Holme Factory. There was but little competition in wool, there being only five competitors for the prize for longwool, and two for that for shortwools.

PRIZE LIST.

JUDGES.—CATTLE: J. Widdowson, Hucknall Torkard; R. Hall, Borough Fields, Walton-on-Trent. AGRICULTURAL HORSES: J. Manning, Oringbury; — Saint, Alkington. HUNTERS AND HACKS: — Grummett, Westby, Grantham; — Colton, Newark. SHEEP AND PIGS: H. Dudding, Pantou House, Wragby; C. Keeling, Yew Tree Farm, Penkridge. ROOTS AND GRAIN: S. Robson, Melbourne; U. Sowter, Derby. CHEESE AND BUTTER: G. Smith, High-street, Burton; — Daniels, Ashby. IMPLEMENTS: — Abell, Engineer, Derby; E. G. James, Thurlston; J. Rose, The Ash.

CATTLE.

DAIRY CATTLE.

Four cows for dairying purposes, belonging to members keeping more than twenty cows; they must have calved between the 1st of January and 1st of May. Also a silver cup, value £5.—First prize, T. H. Oakes, Riddings House; second, W. T. Carrington, Croxden Abbey; third, M. T. Hopkinson, Woodthorpe, Tupton.

Two cows for dairying purposes, belonging to members not keeping more than twenty cows.—Prize, E. Vale, Rose Hill.

Pure-bred Shorthorned cow, having had a living calf since January 1st, 1874.—First prize, F. Cartwright, Drakelow; second and third, T. H. Oakes.

HEIFERS.

Pair of heifers under three years old.—First prize, E. Vale; second, T. H. Oakes; third, — Tomlinson, Alvaston.

Pair of in-calf heifers, belonging to a tenant-farmer dairying not less than twelve cows.—First prize, W. T. Carrington; second, W. S. Woodroffe, Normanton-on-Soar.

STIRKS.

Pair of stirks, in milk, not exceeding two years and eight months old, belonging to members not dairying less than 12 cows, and bred by exhibitor.—No entry.

Pair of stirks under two years old, most adapted for dairy purposes, belonging to a tenant farmer.—First and second prizes, E. Vale, Rose Hill.

Pair of stirks under two years old, most adapted for dairy purposes, belonging to members not dairying less than 12 cows, and bred by exhibitor.—First prize, F. Cartwright, Drakelow; second, C. R. Chamberlain.

CALVES.

Two rearing cow calves, bred by the exhibitor since 1st January, 1874.—First prize, C. R. Chamberlain; second, C. R. Morewood, Alfreton Hall. Highly commended: F. Cartwright. Commended: S. Robson, Melbourne.

BULLS.

Shorthorn bull, three years old and upwards.—First prize, J. Rose, The Ash; second, J. J. Crofts, Staveley; third, C. R. Chamberlain.

Shorthorn bull, two years old and not exceeding three years.—First prize, A. M. Mundy, Shipley Hall; second, C. R. Chamberlain; third, J. Brooks, Shottle House.

Yearling (or not exceeding two) bull of the pure Shorthorn breed, most suitable for breeding purposes, and which shall be, and has been, the property of the exhibitor six months previous to the day of exhibition.—First prize, J. Wood, Spondon; second, J. Harris, Rolleston Park.

Bull-calf, not exceeding twelve months old.—First prize, C. R. Morewood; second, F. Cartwright.

FAT STOCK.

Beast of any breed.—First prize, J. H. Towle, Draycott Hall; second and third, C. R. Chamberlain.

SPECIAL PRIZES.

Bull and three females of any age, the property of one member; any of the females above eighteen months, to be in milk or in calf at the time of show.—First prize, C. R. Chamberlain; second, J. Langley, Derby.

HORSES.

Brood mare and foal for agricultural purposes.—First prize, H. Thompson, Chilwell; second, W. Hollingworth, Dale Abbey; third, S. Porter, Locko. Highly commended: W. Hollingworth. Commended: M. Audinwood, Weston.

Two years old gelding for agricultural purposes.—First prize, W. Hollingworth; second, M. Audinwood, jun. Highly commended: J. Grammer, Sawley. Commended: J. Hawksworth, Barton Fields.

Two years old filly for agricultural purposes.—First prize, T. Orme, Hoos; second, J. Hawsworth.

Pair of horses for agricultural purposes.—First prize, J. Porter, Weston-on-Trent; second and third, C. R. Chamberlain. Highly commended: J. Poyser, Swarkestone.

Brood mare, best fitted for breeding hunters and hacks, with foal at her foot.—First prize, E. Harrison, Allestree; second, P. Wallis, Derby. Commended: S. J. Clay, Long Eaton.

Hack above four years.—First prize, J. J. Crofts; second, H. Bullen, Ashby.

Harness horse above four years old.—First prize, J. Mayers, Derby; second, W. R. Dick, Ticknall.

Gelding or filly, of the value of £50, not thoroughbred, above three and under four years old.—First prize, M. Audinwood, sen; second, C. Smith, Kirk Langley. Highly commended: T. Cowley, Smisby.

Two years old for hunting purposes.—First prize, W. Parker, Alvaston; second, T. Martin, Derby. The class commended.

Cob not exceeding 14 hands.—First prize, C. Smith; second, A. Ford, Quarndon. Highly commended: C. Jordan, Thulston.

Hunter four years old and upwards, equal to 15 stone.—First prize, J. Hanson, Barrows; second, T. Radford, Coleorton; third, G. Meyall, Langley. The class commended.

Best hunter in either class, four years old and upwards, equal to 12 stone.—First prize, W. Boden, Derby; second, S. Robson, Melbourne; third, Mr. Flower, Derby. The class commended.

SHEEP.

LONG-WOOLS.

Five breeding ewes, having had lambs in 1874, and suckled them up to the 1st of June.—First prize, R. Johnson, Kirk Ireton; second, M. Scorer, Searcliffe. Commended: S. W. Cox, The Cottage; R. Sybray, Ambergate; J. Brooks, Shottle.

Five theaves.—First prize, R. Johnson; second, M. Scorer; third, A. Bryer, Quarndon. Commended: A. Bryer; W. S. Woodroffe, Normanton-on-Soar.

Five ewe lubs.—First prize, M. Scorer; second, A. Bryer. Commended: S. Robson, Melbourne.

Ram of any age above a shearling, bonâ fide the property of the exhibitor at the time of entry.—First prize, R. Johnson; second, R. Lee, Kniveton; third, R. Lee.

Shearling ram, bonâ fide the property of the exhibitor at the time of entry.—First, second, and third prizes, R. Johnson. Highly commended: R. Lee. Commended: R. Lee; R. Johnson.

Ram lamb.—First prize, R. Johnson; second, M. Scorer. Commended: M. Scorer.

SHORT-WOOLS.

Five breeding ewes, having had lambs in 1874, and suckled them up to the 1st of June.—First and second prizes, W. Baker, Moor Barns; third, T. C. Smith.

Five theaves.—First prize, W. Baker; second, C. Smith; third, W. Baker.

Five ewe lambs.—First prize, W. Baker; second, C. Smith.

Ram of any age above a shearling, bonâ fide the property of the exhibitor at the time of entry.—First and second prizes, W. Baker.

Shearling ram, bonâ fide the property of the exhibitor at the time of entry.—First prize, C. Smith; second, A. Findlay, Wingfield Park; third, W. Baker. Commended: J. Lea, Sudbury.

Ram lamb.—First and second prizes, W. Baker.

Five fat wether sheep, of any breed, not exceeding twenty-two months old.—Prize, M. Walker, Stockley Park.

PIGS.

LARGE BREED.

Boar of any age best adapted for general use.—First prize, M. Walker; second, J. Harris.

Sow of any age.—First and second prizes, M. Walker.

Three breeding pigs of one litter, not exceeding eight months old.—First prize, J. Harris; second, M. Walker. Commended: J. Wood, Spondon.

SMALL BREED.

Boar of any age best adapted for general use.—First prize, M. Walker; second, F. W. Meynell, Coxbench Hall.

Sow of any age.—First prize, M. Walker; second, F. W. Meynell.

Three breeding pigs of one litter, not exceeding eight months old.—First and second prizes, M. Walker.

Pig, the property of an agricultural labourer.—First prize, T. Poxon, Alvaston; second, J. King, Hartshorn; third, J. Moley, Thulston.

ROOTS.

Collection (bonâ fide the growth of the exhibitor), to consist of long and globe mangolds, Swede and common turnips, and cabbage: six specimens of each sort to be exhibited.—First prize, J. Greateorex, Stretton; second, J. Startin, Hooper's Farm, Hartshorne.

GROWING CROPS.

Swede turnips, to consist of not less than three acres.—First prize, J. Smith, Lullington; second, J. H. Joyce, Blackfordby.

Mangold wurtzel, to consist of not less than two acres.—First prize, T. M. Ward, Craythorne; second, J. Greateorex.

Cabbage, to consist of not less than two acres.—First prize, W. Hollingworth, Stanton Grove; second, J. Greateorex.

CHEESE.

Cheese of not less than 1 cwt., made by exhibitor in the year 1874.—First prize, J. Felthouse, Grendon House, Atherstone; second, W. T. Carrington, Croxden Abbey; third, J. Brooks, Burrows.

Cheese, of not less than 1 cwt., made by the exhibitor in 1874, to be competed for only by those persons who, being members of the Derbyshire Agricultural Society, shall not have made any cheese on the Sunday after the 14th June, 1874—Factory cheese, Mickleover Cheese Factory. 2 guineas each to Derby and Longleat Factories; 1 guinea to Holme Factory.

BUTTER.

Milk butter (not less than six pounds) made by the exhibi-

tor.—First prize, A. M. Mundy, Shipley Hall; second, A. F. Hurt, Ravenstone.

Milk butter (not less than six pounds) made by the daughter of a member.—First prize, W. Jackson, Atlow; second, J. Greateorex.

WOOL.

Three fleeces of long wool.—Prize, R. Johnson, Kirk Ireton.

Three fleeces of short wool.—Prize, J. Rose, The Ash, Etwalt.

GRAIN.

Sample of red wheat, three bushels, and to represent a bulk of not less than ten quarters, to be subject to the inspection of the judges.—Prize, J. Greateorex.

Sample of white wheat.—First prize, J. Greateorex; second, W. Woodroffe.

Sample of barley.—Prize, J. Greateorex.

Sample of oats.—First prize, J. Greateorex; second, J. Startin.

AGRICULTURAL IMPLEMENTS.

Selection of implements for agricultural purposes.—First prize, J. and G. Haywood, Derby; second, G. Ratcliffe, Derby.

Messrs. Ratcliff and Co. also obtained a silver medal for a reaper, the inventor of which was Mr. Earl, of Melbourne. A medal was also awarded to Messrs. Hathaway, Chippenham, for a churn.

At the dinner, Lord SCARSDALE, the chairman, believed he might congratulate all present upon having witnessed a very good show. The cattle classes were unfortunately short in numbers, but he had been told they were very good in quality, and he was afraid that the paucity of numbers arose from the prevalence of the foot-and-mouth disease, and very possibly from the shortness of keep owing to the dry season through which they had just passed. The show of sheep had been a very good one, the animals being large in number and excellent in quality. He had also been told that the classes of agricultural horses had been exceedingly good, better, perhaps, than had ever been seen in Derbyshire. He should like to suggest that, if possible, a few more prizes should be given, and that the competition in some cases might be extended, perhaps to all England. He believed that during the past year there had not been any papers read or lectures given upon subjects connected with agriculture, at the committee meetings of the Society, which was to be regretted for many reasons, and he hoped that during the coming year the Committee would see their way to remedy this defect, if it was one. He wished to say a few words respecting the great extension of the factory system of cheese-making in Derbyshire, and he was sure it would be a great source of regret to all present that the Hon. Mr. Coke and Mr. Crompton, who might be looked upon as the founders of this movement in Derbyshire, were absent on the present occasion, for they would have given a great amount of useful information on the subject, and Mr. Crompton would have been prepared with a great many interesting details. One great advantage which had accrued from the factory system of cheese-making was that it had opened the eyes of farmers to the value and importance of co-operation, and he hoped that was a fact which would not be lost sight of by them; for he believed the co-operative system was capable of far greater development than it had at present attained, and might be of considerable advantage to the farmers in their business. If it would meet with the approbation of the Committee he should be very happy to offer a prize of ten guineas for the best practical paper on co-operation amongst farmers. Another advantage arising from the factory system was that it tended to bring landlords and tenants together; they met together in committees, and exchanged ideas upon subjects in which they were both interested; it improved the relations between them, and it enlightened the one as to the requirements of the other; and surely everything that tended to the benefit of the landlord must also be to the advantage of the tenant, for their interests ever were and would be identical. He wished also to allude to the use of the steam plough. He believed two of these implements were in operation in the neighbourhood of Derby; they had had plenty of work to do, and were likely to be kept fully employed, and he looked upon this also as a sign of the progress of agriculture in this county. It was a matter of congratulation that in this district they had

been free from those disputes between employers and employed which had agitated many districts, especially in the Eastern Counties. Certainly the wages of agricultural labourers here were higher than were given in some parts of England, where, he must admit, it was only right and proper to raise the scale of the labourers' wages. In this neighbourhood, however, he believed the labourers had been properly and fairly remunerated for their work, and had been justly dealt with by their employers; and it had always been a pleasure and the wish of the farmers to contribute to the happiness and welfare of their labourers. He only wished that in many parts of the country the labourers were better housed, for he believed that to be the source of the dissatisfaction which had lately existed amongst them. They were all aware of the extreme difficulty of cottage building in these days, and if there were only some means provided of building habitable cottages at a less cost it would be a very great advantage. He ought perhaps before that moment to have referred to the abundant harvest with which they had been happily blessed, and for which they ought all to be thankful to Providence, and also for the exceedingly favourable weather which had been experienced during the gathering of the crops. Bread would be cheap and plentiful, which, with the prospect of winter before them, would be of great advantage. He wished to say a few words with regard to the sale of milk in this district, which had lately assumed considerable proportions. This was a very important matter, inasmuch as a large supply of milk was furnished from this district to the large and populous centres of industry, and it was very desirable that the commodity thus supplied should be pure. He thought the Society might be of use in collecting information in relation to various questions affecting the milk supply, such as the price of milk in various towns, the carriage of milk by rail, the best mode of conveying it, and the proper temperature at which it should be conveyed, so as to keep as long as possible. All such matters as these might come under the observation of the Society, and their investigation would be of great benefit. He had had pleasure in walking through the horticultural show, but he should like to have seen a larger number of entries, though the show was a good one as far as it went. In one corner of the horticultural show he saw a plan of the Mickleover Lunatic Asylum; he did not quite understand that, for he did not think that horticulture was likely to cause people to lose their reason.

Mr. T. W. EVANS, M.P., proposed "The Chairman." From the fact that he had lived so long in the immediate neighbourhood, he had had opportunities of knowing what his lordship had done with respect to his land better than those farther removed. He would, then, say that he had never seen any property which had undergone such a great and remarkable improvement as had Lord Scarsdale's during his possession of it. Since he had taken it in hand, great improvement had become manifest; he had just taken up draining as a most important point, and then the erection of houses, setting, in this respect, a most excellent example. By this means not only was the land made of greater fertility, and tenants enabled to benefit by this greater power of production, but it was of advantage to the entire community.

Mr. COLEMAN had been struck with the greater prominence and merit lately assumed by the cart-horse, which was now regarded as of more importance to the farmers. Competition must improve the articles brought together; if a man thought his things were better than anyone else's there was nothing like letting him compare them with his neighbours'. As to the Mickleover cheese factory, they might not go to Mickleover for the greatest sense in all matters, but when they found that cheese from that place could produce 86s. 6d. at six weeks of age, they would see that it could do something.

Mr. Alderman ROE was of opinion that the operations of the Society ought to be extended, and recommended that the show should be open to all England; the horticultural department was not successful until a similar step was taken with regard to it. He recommended that a prize should not be awarded when only one animal was exhibited in any class, believing that that would tend to cause a larger number of entries, neither would he allow a person to take a prize above once for the same animal.

Mr. M. WALKER here interposed, and said the nearer the Society confined its operations to the county the better. As an exhibitor of this Society, and a travelling exhibitor visiting many shows in the country, he could say that those county societies which opened their exhibitions to all England, were all going to the ground. Last year he did not exhibit any pigs at the county show, and he believed it was in consequence of that circumstance that there was such a good show of pigs that day. He had observed to some of his neighbours that he must "sweep the deck" of prizes, and if he had done so he should not have come to the show again, preferring to allow other persons to have an opportunity of gaining the prizes, for when it was known that such competitors as himself, whether in the cattle or pig classes, were about to exhibit, it prevented outsiders from competing. Shropshire sheep were not so well represented as they ought to be, which he attributed to the fact of Mr. Baker taking the whole of the prizes in that class. [Mr. Walker was about to make some further observations when there were loud cries of "Chair," and his Lordship requested Mr. Walker to give way.]

THE NORFOLK CATTLE PLAGUE ASSOCIATION.

—A testimonial was never better earned than the one which has been voted by the Norfolk Cattle Plague Association to their chairman, Mr. Clare Sewell Read, M.P. The work of the Association is happily now a thing of the past, but the Committee know how indefatigably Mr. Read worked when the occasion required, and how well he won a title to a recognition of his services. We cannot conceive it possible that any single member of the Association will demur to the course adopted, with respect to a small portion of their money, not only with reference to the presentation to Mr. Read, but also the deserved acknowledgment to the painstaking secretary, Mr. C. R. Gilman; and can only hope that the occasion will not again arise to call for the disturbance of the large amount now vested in the Funds.—*The Norfolk Chronicle*.

TENANT-RIGHT FOR SCOTLAND.—At a dinner and presentation to Mr. Davidson, late farmer, Culbae, Wigtownshire, in responding for the tenant-farmers of Wigtownshire, Mr. M'Cracken said that in his recollection, through enterprise, energy, and the application of manure, the tenant-farmers of the district had many times multiplied their capital. Their stock had so much increased in value, and they had to expend so much more in labour, manure, and implements, that the capital has increased perhaps four-fold in many farms; and, therefore, these tenants should have a far greater security for that capital than they have. The circumstance that had brought them together that night was one of the strongest proofs that they could have of the necessity for that security. If they had a law in the country to give a tenant compensation for his improvements, he questioned very much if they would have seen their friend Mr. Davidson going out of the country. He could recollect seeing when a boy bogs and banks of briars and thorns on the farm of which their guest was lately tenant, and now on the same farm there had sprung up smooth green pasture. And as far as he could understand, all that was done at Mr. Davidson's own expense. Certainly in these circumstances, a man's labour and improvements ought to be taken into account, or the State, in some shape or other, should step in to protect him from being turned to the road without any consideration for the improvements he has effected. If we had a law giving compensation for these improvements, then the agriculture of the country could go on steadily. There was an old saying in his part of the country, "He that stints, sits; and he that improves, flits." He thought if tenant-farmers would only set themselves to examine that question, and remember it when certain gentlemen come round asking Parliamentary favours, he thought they might come to bring about an improvement on that point.

AYRSHIRE FARMERS' CLUB.

THE RELATIONS OF LANDLORD AND TENANT.

At the annual meeting, held in Ayr, Mr. J. P. Willison, Maxwellton, in the chair, the subject for discussion was, "The Present Relations between Landlord and Tenant."

The CHAIRMAN read the following paper: The earliest information history gives of the cultivators of the soil tells us that they were in a state of villenage or slavery, and at the unlimited disposal of the owners of the land for life or for death. How they obtained their liberty is not very clear. I believe the Church of Rome claims the merit of getting it for them, and there appear no good grounds for proving that they obtained it by any other means. Their next state seems to have been that of steel bow tenants; the landlords providing the farm stock and implements of husbandry and the tenants the labour, the production of which was equally divided between them. In this state the tenants were enabled to acquire capital. With the increase of commerce and national wealth the tenants by degrees obtained the means to stock the land with capital of their own, and to be in much the same position in relation to their landlords as they are now. Yet this third stage, although similar in many respects to that of the present day, was in others very much different. This might be called the patriarchal stage. At this time the value of land was very low, and yielded but a small income to either landlord or tenant. The tenants might still be styled, as they were in the second stage, "the poor bodies who tilled the land." The competition for farms was not great, and the habits of both lairds and tenants were much more plain and simple than they are now. It was very rare that an industrious tenant ever dreamed of leaving his farm or of a laird parting with an industrious tenant. The lairds might be said to dwell among their own people. There is much in this stage that is picturesque. Of course there was much "scraping and bowing" on the one side, but on the other there was also much real interest felt and kindly commingling. The tenant looked upon his laird as his only governor and protector, and the laird on his tenant as something that was really a part of himself. As wealth and commerce increased, and of course the value of land, the lairds began to see that the state of things was not good, and that, for the benefit of the tenants no doubt, rents must be raised, and they by that means stimulated to make greater exertion. None of us, I am sure, can find fault with this, because without some such stimulant no progress can be made in anything whatever. Our just complaint is, that while the landlords have withdrawn the patriarchal wages, they still continue to demand the patriarchal service. Now, this is hardly fair. The landlord is not now a patriarch, he is simply a land-merchant, who, according to the strict rules of political economy, sells his land in the dearest market. The changes that have taken place in the relation of the different classes of society to each other during the last forty years have been very great. No one class can be said to be dependent on another except the tenant-farmers; indeed they may be said to be the only class that is not yet emancipated. As a proof of this, I have only to remind you of the contracts which we sign; contracts containing clauses the like of which are not to be found in any other contracts under the sun, and above all this, we are expected to pay the wages of complete political subservience, and to acknowledge at least by silence that the government of a landed aristocracy is the only government that is good. You may naturally ask me "Where is the remedy for all this?" I believe there is a remedy if we seek it in the right direction, but not in the direction we have hitherto sought. It is held to be a maxim that the interests of landlords and tenants are exactly alike, but before that maxim can be applied here, we must first find out whether both parties have agreed as to what is their common interest. I have no doubt landlords, as a rule, are anxious to have their land well farmed, but, unfortunately, they want something more, and that something is far more precious in their eyes than the other. They want as much game as their land will feed; and they want their tenants' votes at county elections. Said an English squire the other day in public—"I respect my tenants as much as any man can do, but if I must part either with my tenants or my game, I will not part with my

game." These few words of this frank, outspoken English squire leave nothing to be added on this head. The interests of landlords and tenants are alike! Are they? Let me recall to your memory a few incidents in Parliament and out of it. I shall not go very far back in time, and I think you will distinctly remember them all. Not long since, Lord Derby told an assemblage of English farmers that the land of England did not produce above half what it ought to do under good cultivation. I think you will agree with me in saying that if there is one man in Britain who is more remarkable than another for common sense, that man is Lord Derby. Lord Derby must have known that before the tenants could be expected to employ more capital in the cultivation of the land, they must first have some security that they would reap the benefit. But Lord Derby did not tell them, nor, so far as I know, has he since told them, that he would grant them leases and assist them in securing Tenant-Right. Very lately, Lord Malmesbury called for a return to Parliament of all the ground game sold under licence in England, for the purpose of showing what a boon the labouring classes were receiving, in being able to get so much cheap and nourishing food. I never heard, though, of Lord Malmesbury having called for a return of the cost at which that game was reared and fattened by the English farmers. I will here put a question to Lord Malmesbury, which, I hope, somebody will be good enough to convey to him. Supposing all the field fences over England were levelled to the ground, and all the sheep and cattle allowed to roam at pleasure, would their beef and mutton be a cheap food to the British nation? If Lord Derby is remarkable for common sense, surely Lord Malmesbury must be remarkable for some other kind sense. You will not have forgotten a gun bill and a farm dog bill, which costs each farm fifteen shillings a year, and some a great deal more. It is the only tax that I know of on implements of labour of any kind. It may be said that the landed party in Parliament did not bring in these bills. True, but why did they not oppose them; they can always muster strength enough to strangle a game bill. If the interests of their tenants are so dear to them as they pretend sometimes, here was a famous chance for proving it. Some outspoken people said that they rather liked these bills, as they would afford more protection to their darling game; and certainly they would have some grounds for saying so. Our member for South Ayrshire is a Conservative, but is said to be a very liberal one. On the eve of the last general election, what did he say on the game question? He said "he would give the ground game to the tenants by law; but would not interfere with right of contract." The honourable gentleman must have known that the English tenants have possession of the game by law just now, and we all know what it is worth to them. He very much reminded me of the old farmer who, when his servant complained to him of his food, said, "My good fellow, you will have no need to complain again on that score, instead of giving you potatoes and herring, I will now give you herring and potatoes." Yet this is the gentleman we have sent to represent us in Parliament. For my part, I have come to the conclusion that we have been altogether wrong in our way of dealing with the game question in trying to carry out what is called Mr. Loch's bill. I pay no heed to the argument about the sacredness of the right of contract. There is not a year in which Parliament does not interfere with the right of contract in some way. In fact such legislation has been a favourite hobby with the landed party for the last forty years. They have carried it into ships, mines, manufactories, truck shops, and almost into every shop but their own shop. We must confess, however, that it has never been applied to any class so high in the social scale as we are. Besides, I do not see how it might not be evaded in some way as it is evaded by the truck merchant. Further, what can we say to the other working classes of the nation, who may well argue, as they do, that if game preserving is an evil, by Mr. Loch's bill that evil would only be taken out of the hands of the landlord, and put into the hands of the tenant. We all believe, of course, that no tenant would preserve game to do injury, but still the argument is just enough, and we have no proper answer to

give it. They say, too, and very justly, if these Game-laws are so very oppressive, why not get quit of them altogether? The power is in your own hands. Parliament long ago gave you the franchise, and now, that you may act independent of your landlords, it has given you the ballot. If year after year you send members to Parliament who are determined at all hazards to preserve these laws, you at least have no reason to complain. I would have dropped this part of the subject here had I not read some remarks on this question spoken the other day at Maybole by the member for Ayr burghs. Sir Wm. Cunningham said, "Farmers seem to have forgot that the Game-laws conferred many benefits on the general public, who had a right to have their interests considered as well as the farmers. There could be no doubt that the preservation of game had a great effect in keeping country houses occupied, for many such houses would be vacant if it were not for the amusement of shooting, which induced the proprietor not only to reside there himself, but often to collect a large party to fill his house." Now I for one protest against the picture that we are obliged to draw from words such as these of the Scottish landed gentlemen. Is it possible that he can have no love for the hills over which he may have first seen the sun rise; for the stream which he waded when a boy, and in which he may have caught his first little trout; for the trees which were then like himself, little saplings, now sending out their branches high and wide to the breeze—an emblem of passing time, and well fitted to beget the reflection, "What am I doing, what have I done." Is there no allurements in all the charms of nature where nature is most lovely, a prize for which thousands amid dust and smoke are daily toiling, and which few succeed in getting? High above these things, can he feel no interest in the people who work and toil on these lands of his—lands which though but yesterday may have been the product of so many bales of cotton, or so many tons of iron, yet a people to whom he is bound by all moral ties as firm as parchment could bind him to his acres? Is there no suffering among them that he can help to alleviate? are there none whom he can help onward and upward? May there not be some from whom he can learn? If all these things will not allure and attach him to his country home, then, I say, away with him, he is of no manner of use here; off with him to the jungles of India, let him have shooting and killing to his heart's content; there at least his sport will have the dignity of toil and danger. Sir William further says, "Every village carpenter, grocer, doctor, smith, and trades of every kind were benefited, more or less, by the Game-laws, to say nothing of the benefit and healthful exercise it afforded to those who were in a position to take advantage of them." My answer to this may be very short, for I never knew of any village carpenter, blacksmith, or grocer getting twenty shillings' worth of benefit from the Game-laws, unless he was a poacher; and the exercise of shooting being such a healthy thing there must be a very few windfalls for the village doctor. Sir William must have been thinking at the time of some wilderness of man's making in the Highlands, where some cotton lord may rule over fifty or a hundred thousand acres, and where there is not a living soul but himself and his gillies to employ tradesmen of any kind. Again Sir William says, "There was also a benefit which should not be forgotten, the greater amount of occupation the Game-laws gave to labourers and working men, not merely gamekeepers and game-watchers, but gardeners, grooms, and odd men." Sir William surely does not know that there is such a thing as political economy, and that all intelligent men understand and believe in it. If a political economist came to ask anyone here, Where is the product of your year's labour? your answer would not be far to seek; indeed you need hardly speak at all—you might only point to your stackyard, the mason and carpenter could point to the houses they had built, but I do not know what answer he could get from the employer of grooms and gamekeepers. To be sure he might say I have enjoyed myself and got a good appetite, as for the rest, I suppose it is none of your business. When we hear the Game-laws upheld by such arguments as these, one is apt to feel more sorrow than anger, and no one who is not a bitter enemy to the landed aristocracy could ever wish to hear them repeated. I at one time entertained the hope that the signs of the times would have educated a number of clever young lairds in every county, and that they would have come forward and volunteered to lead us and champion our cause, but so far from

this being the case, we have experienced exactly the reverse. Many of the young reform chiefs have gone over to the other side; and if we may judge from the attitude of some of the older ones at the last general election, they even have no great stomach for reforms in our line. This, I believe, is counted by some as an omen of great strength and long life to the Conservative cause. I do not share in that opinion. I look upon it rather as an omen of great danger, which if it goes on, must ultimately tend to unite the tenant class into one compact political body, and then I would say landlords need not bother themselves much longer about politics. When I think of the present position of the landed class, there is a picture that often rises in my mind. It is that of a captain about to go into battle while the crew of his ship is in a state of mutiny. Whether landlords like it or no, the Game-laws must go, Hypothec must go, and Tenant-Right must come; and if they do not wash their hands of these things, there will be a mutiny some day. One day talkative Boswell said to the famous Samuel Johnson, "Sir, don't you think the people were happier under feudal rule than they are now?" "No, sir," returned Samuel; "and the proof of it is they wished to get out of it, and have no wish to return to it." Barly Sam, sturdy Tory though he was, had too much regard for the truth to give his countenance to a falsehood. We have now no specimens of the feudal rule, but we may still look upon its offspring, the patriarchal. In some of the fairest and most fertile counties of England, where baron's castles, squire's halls, and lawns, and parks, are the finest—even where rosy, well-paid churchmen are plentiful, tell me how it is you will there see the land worst farmed, and the farm labourer a spectacle of poverty and ignorance. Naturally one would expect to find there every man sitting under his own vine. Hodge, the other day, found fault with his beans, and rebelled against his master, the English farmer. Hodge had not enough of wind in him, and has been beat in the struggle. Now, it is rather an important question—What is to be the future of poor Hodge! Is he to continue the same half-starved ignorant drudge that he has been? No! I have much better hopes for Hodge. I hope and believe he will emigrate to lands where he will find the fitting elements for his growth to manhood. This, too, I believe, is the best thing that could happen for the English tenants. They will then be forced to direct their energies to the right object—that of procuring leases and Tenant-Right—and will find out by-and-bye that they have a somewhat nobler mission to perform in this world than rearing game for their landlords' amusement. I doubt not many conscientiously believe that the government of a landed aristocracy is the best. Be that right or wrong, of this I am certain, it is a thing which we Scotch tenants have not the slightest interest in upholding. Our real interest is to get liberty to cultivate the land in such a way as we may find most profitable, and to get security for the money and labour we expend on it. It is clear we shall never get that, so long as we send the present kind of members to Parliament—I am speaking of neither Whig nor Tory. I mean that our work is just like other people's work, if it is to be well done, it must be done by ourselves; or, as our friend Sir William says, "We may wait in vain till the 'crack of doom.'" The time is not far distant when no man, however high born or wealthy, will be trusted and followed as a leader who does not employ himself in some useful pursuit. It is for our young lords and lairds to look to this. If they allow the Government of the country to pass out of their hands, they may not get it back again, though they seek it with their tears. I do not know in this wide world a field for work like that possessed by the British landowner—a work, which, by all wise and good men, is considered the highest and noblest. He has a little kingdom of his own, which contains all the elements for thought and study that is contained in the biggest kingdom in Europe. He can tell his people, like Lord Derby, that the land might be able to produce double; but he need not stop there. He can say, "Come with me and I will assist you in finding out how it is to be done, and then I will help you to do it." I beg a parting word to the young men of us who are just beginning the world. According to my view, the time may not be far off when their influence may have much weight for good or for evil in the destinies of our country. If they study with care the science and literature of their calling—if they carry into their business the utmost integrity, diligence, and skill they can command—they will find that they have received the best education

that can be got for giving efficient aid in the government of the State.

Mr. CUNNINGHAM (Chapelton) was exceedingly pleased with the paper just read. The subject—the relations between the landlord and tenant—was a most important one, and he thought the tenants would do well to consult that relationship and on their part do everything that lay in their power to meet the views of the landlords consistent with the spirit of the age. It had been justly brought out in the paper that there had been something like serfdom in their profession. They were certainly now in a better position, and though he believed the most of them had good landlords, still owing to the state of the existing law it was almost impossible for a landlord to be a just man. There was the greatest need for an alteration of the existing laws both for the benefit of the landlord and tenant. He fondly hoped the day was not far distant when our legislators would see the necessity of doing something on behalf of the landlord and tenant, and therefore on behalf of society at large. He had not the smallest doubt the outside world was as great a sufferer as they were themselves by the present system.

J. B. LINDSAY (Irvine) said that, to maintain a harmonious relationship between landlord and tenant is much to be desired, and is favourable to the prosperity and comfort of both parties. Land as a subject of property, while capable of much improvement, is also liable to serious depreciation. It is, therefore, a serious matter for a proprietor to alienate from himself his property for nineteen years. In doing so he requires protection, and it has hitherto been for the most part sought in the many clauses and restrictions of leases. I venture to doubt if all the clauses and restrictions yet devised will compel the improvement of land or afford the protection sought. I would respectfully suggest that a far more efficient protection is to be found in a well-devised scheme of compensation for improvements, and not only would protection be found, but it would afford to the landlord a legitimate source of enrichment, while at the same time bring comfort and security to the tenant.

Mr. BRUCE (Auchengate) said this question is one which requires to be handled with delicacy, and very carefully considered. It is important that the relationship existing between landlord and tenant be harmoniously maintained, and the solution sought in a spirit of equity. The landlord has risks during the currency of a lease—for instance he may let a farm to a tenant who shortly afterwards becomes insolvent. As a set off to this, hypothec is at present the landlord's safeguard. But it is very doubtful if such protection is equivalent to that which would be gained by a well-approved system of compensation for permanent improvements. Under the present arrangements the land is too often deteriorated in value, especially at the expiring of leases. Whereas a compensation scheme providing for the safety of the tenant's expended capital would effect an increase in the letting value of the land, bestowing as it would undoubtedly do, a reciprocal benefit on the outgoing tenant, incoming tenant, and landlord, through the most powerful of all motives, that of self interest. I am of opinion that if a tenant reduces the value of a farm it is proper that the landlord get full damages. Whereas if a tenant can show improvement he ought in equity to receive compensation for such when quitting his holding.

Mr. HOWIE (Law, Dreghorn) said that they were apt to expect far too much from Parliament. He did not see that the farmer could be very much bettered by Parliament. He believed that compensation should be given to the farmer at the end of the lease for improvements, and that landlords should receive compensation if the farm had been deteriorated.

Mr. WALLACE said the subject was one which was allowed to be a very critical one to deal with. It was a pity that it should be so, because there was a tendency to make mistakes about it. It gave rise to one mistake. Landlords were apt to think that farmers as a class liked to go against them, and they might be a little selfish. It was a very natural thing when the proprietor did as they did—went to the market where he would get the greatest price. But he thought proprietors might make a mistake, and in some cases they did, in thinking too much of how they could deal with this and that bargain. If they wish to do it all to their own advantage, they would try to chalk out the bargain in such a way that they might profit by it. But the great deal that had been said in the public political arena, that the farmer was against the landlord, only required to be tried. He thought

if people would look into the matter and give it a trial they would find that the farmers were not against them, and what they differed upon would really be for the advantage of both. He thought the proprietors had the same interest, although they were in different circumstances. It was natural they should have a great interest in the land, and for that reason great sympathy for and in the interest of the tenant. He was convinced that they (the farmers) had lairds who were ready to sympathise and encourage them, and though they (the landlords) might not be in a position to give them money, he did not think it was necessary. The farmers could not expect them to give away money without some benefit from it. If they got intelligent proprietors—men with whom it was easy to deal, who understood what was a right and what was a wrong thing, and encourage them as far as in them lay by their countenance, it was a great help to them to go on doing what they could towards their land, and themselves. He thought they should take up the question in a broad light, and not take any selfish view of it. It would expedite matters if they were to do something to disabuse people of the idea that they were there separately as a class.

Mr. DALGEISH (Templart Mains) said one did not like to say anything about their superiors; but still there was no doubt that there were great faults in their landlords in the way they conducted their estates, and the usage they gave to their tenants. But he had no doubt that by the process of riddling they would get as much hair grass and fully as many weeds among the tenantry as amongst the landlords. To begin to legislate he did not know would make a decided settlement. As long as human nature was as it was presently, they might look for nothing but faults and failings amongst the rich as well as the poor and middle classes. Instead of legislating to make alterations in the relations between landlord and tenant, he thought if they could diffuse a spirit of equity and honesty, reciprocal by both parties, it would be far better than taking up an attitude of force or defiance. At the same time it was necessary to have regulations to secure parties to a certain extent. But a tenant taking a farm for nineteen years under certain stipulations—that he was to plough under a certain rotation, and would grant that that rotation was actually the best adapted to the circumstances of the farm, that he would manure up to a certain quantity—he often found it—at least in the leases with which he (the speaker) was acquainted—to his own profit to go beyond the landlord's stipulation in manuring rather than to keep within them. And when a person took a farm they ought to calculate what was to be the consequences during the currency of their lease, and what was to be the issue at the termination; and while they improved the farm, they improved their condition besides, if the improvement was conducted on a proper footing. At any rate, it would pay the tenant better to improve his farm during the currency of his lease than to impoverish it; for the moment that he attempted to impoverish his farm he would impoverish himself. It was very far wrong to remove the regular quantity of manure at the end of the lease; and in proportion as he withdrew his support to the farm he will withdraw the support from himself. He would advise, however, that instead of using a great deal of farm manures it would pay well enough to take artificials at the latter end. It was perfectly natural in the increase of the value of everything that the landlord should look for a rise of rent at the end of the lease, provided that he was up to the times. For the landlords had their expenditure to meet as well as the tenant, and really he did not see well what could be done. The matter must stand as it was, and they must take the good and the bad as they came. He for one would rather have our aristocracy as they were than have the lands put into the hands of the Government, and to submit to the supervision of the Government officials. Amongst very many of the landlords there was the greatest sympathy and kindness to the tenants. He would be very dry himself in receiving the Government official when he came round to see that every nicknack was as it ought to be. He rather thought they would not meet their case better than by letting things take their natural course. There was a great many faults that they might find with the management of and contracts in lands one way and another, but then, if they looked at the tenantry who were of widely different characters, it was absolutely necessary that the landlords should secure themselves against the conduct that may be practised by them, and the case with regard

to the landlords might be stated as just *vice versa*. So it was not easy to lay down rules that would be generally permanent and good in their effect, so long as society had so much selfishness mixed in it.

Mr. CUNNINGHAM (Chapelton) wished to state that he thought there was no desire on the part of the present or any other farmers' club to injure the landlord, nor yet to have his land under-valued. He thought they could not be accused of attempting to under-value his land; he thought their intentions were the very reverse of that. He should be sorry that they should meet together to read papers and discuss them, to find out any way to cheapen land. They only wanted to give a fair field for the benefit of the landlord and tenant when they showed themselves anxious to negotiate or propose any arrangement different from what at present existed. It would be a mistake to leave such an idea unassailed, because he really believed that in the present time landlords were as much fettered as the tenants were through the existing laws.

Mr. YOUNG (Kilwinning) said some people thought the present subject just a little too political for the Farmers' Club. He shared in that opinion to a certain extent. His opinion in regard to the relation between landlord and tenant was that it might be improved in three respects, not only with advantage to the landlord and tenant, but also to the public. He was persuaded that the law of hypothec should be abolished, and the Game-laws modified to the extent that every occupier of land should have the right in common with his proprietor to kill all wild animals, which would enable him to protect his crops, which were his own, and for which, in his humble opinion, every tenant ought to have protection. The other point was Tenant-Right, or what was better called, compensation for unexhausted improvements. He hoped the landlords would take these subjects into their consideration. He was satisfied that no class in the community would derive greater benefit from a change in that direction than they. At present, the majority of farmers knew that they were not to continue on the farm, they did not farm in the same way in the last two years of their lease. The most of them carried that too far, and the consequence was that the proprietor had his land to let, and he was desirous of doing so with the farm in the best possible condition when it was found in the worst. He was glad to see that in England the large proprietors had already admitted the justice of the proposals he had referred to, and were quite willing to give their aid in getting a fair and reasonable measure passed which would give compensation for unexhausted improvements. On the other hand, he felt it was quite right and proper whenever a tenant through his negligence and bad farming depreciated the natural fertility of the soil, he ought to be compelled to pay for such depreciation. The chairman made some allusion to the Game-laws, which was the only point upon which he could not agree with him. He (the chairman) seem to have thought that if the tenants had the right to the game, probably they might keep a large head of game. Now, he ventured to say that not one in fifty tenants would try to keep up a large head of game. They could not afford it, and were not so foolish. The game destroyed eight or ten times more than they ate. The only other point to which he would refer was the fact that the interests of the landlord and tenant were mutual, more so than the chairman seemed to hint. He believed what was good for the one was good for the other.

Mr. CUNNINGHAM (Shields) said the subject seemed one not very prolific of discussion amongst farmers. There seemed to be a feeling abroad that there was a danger in saying much or anything in regard to the relations between landlord and tenant. He could not see why that should be so. There was undoubtedly uneasiness amongst the tenant-farmers in regard to this question. There was considerable discussion, writing, and talking in reference to those questions concerning the landed interest, and it was their bounden duty and privilege to meet together to talk over those matters which concerned their welfare, and to devise means whereby the evils with which they were beset might be partly removed or altogether abolished. The chairman traced the relationship of landlord and tenant down from the very commencement, and he showed that early in history the tenant-farmer was in a state of serfdom, and if he (the speaker) understood him right he showed that in the 19th century and Christian land of Scotland they were in a great measure still in the same condition. He quite agreed with him, and it was quite a mistake to talk in such a way as if there were not a more independent

class existing than the tenant-farmers. He denied that *in toto*. So long as they were compelled to sign leases on the conditions that were frequently attached to them, they were virtually serfs. They could call themselves nothing else, and they could not help themselves until those questions in connection with land were legislatively settled. He quite believed, and would verify the statement of Lord Derby, that the land of this country might yield double it did at present. There was not the slightest doubt about this if there was sufficient capital, and there would never be sufficient capital until they had security for the capital, and were placed on an equal footing with their landlords in making their bargains. It was well known that if a landlord and a tenant made an agreement, it was always one-sided, because the landlords, having the making of the laws, made them for themselves. In regard to the question of the Game-laws, it was an impossibility to have high-farming and a large head of game. He believed that was thoroughly experienced by the late Marquis of Ailsa. He found it utterly impossible to farm well and keep up a large stock of game. Therefore, if they were to have over-preservation of game they might bid adieu to high farming or farming to pay. He believed very few tenants would complain of game unless there was considerable damage done. But what they had to complain of was that instead of any improvement in the young landlords it was worse. The hand dial instead of going forward was going back. It had been said that there was a prospect of this game question being settled. The party was in power who would do it; and therefore there was no doubt that if farmers would just be a little more moderate in their proposals, and by doing very little and saying almost nothing, the thing would soon be settled. All he had to say was that if it was to be settled in the way in which it was talked about, they would settle it for themselves. That put him in mind of some strangers from a foreign country who were attending the Ayr races. They were amused with the actions of the light-fingered gentry who were endeavouring to inveigle a plain countryman. But the countryman was not to be done, and the strangers were particularly amused at the answers he gave to the light-fingered gentlemen—"Ye can play wi' yoursels." So it was with the party who were to settle the matter for the farmers; they must do it themselves, and he did not think the farmers would be inclined to go into the matter. As to game being a blessing to the country, it was rather a curse. He believed there were statistics, but he had been unable to lay his finger upon them. He knew, however, the number of criminals these Game-laws occasioned. And they all knew that when once a countryman was imprisoned, it did not matter for what it was, he ran the risk of his character being ruined for life; his whole life, as it were, was pilfered away from him by these iniquitous Game-laws, and the other day there was a case in point in Aberdeen where a very heavy penalty was inflicted, and the Sheriff himself was obliged to admit that the penalty was far too great for the offence. The law that punished a man so iniquitously—for he had never been brought to see that the killing of a hare or rabbit was a crime—should not be on the statute book of a Christian land. In regard to what had been said about the Conservative party being the party to grant relief, and that the Liberals had done nothing, and it was not their interest to do it, he would read a game clause of a landed proprietor, who was a Liberal, and also a clause of his successor on the very same estate, but who was now a Conservative. The game clause of the Liberal landlord was to this effect: "And reserve to the landlord the exclusive right to hunt, shoot, and fish by himself, or any person having his power and authority." The clause of the Conservative landlord was somewhat as follows: "That he shall reserve to the landlord the whole game on the said land with the exclusive right to hunt, and those having his authority, and no claim shall be raised for damage done by game, and the tenant binds himself to protect the plantations, preserve the game, and, so far as in his power, prevent poachers and others from trespassing on the land." He should leave that to any one who should like to judge which of the two landlords was likely to command the respect of the tenant farmers, and those who had to do business in the way of land. As regards the other question, he was glad to see that a number of the proprietors themselves were moving in the matter, and they had good reason to believe that the Marquis of Huntly, who last year introduced a bill on the subject, but they knew with what reception from the landocracy, meant to re-introduce it. He

was the more glad because he (the speaker) believed it was framed in accordance with equity to both landlord and tenant, and would be the means if passed by the Legislature of improving the relations between landlord and tenant, and of setting at rest a great many of those questions at present irritating one another.

Mr. RILLIE said the statement of Mr. Cunningham with regard to the keeping of game on the farms of the late Marquis of Ailsa was scarcely accurate. When Mr. McCall had the farm referred to, the rent of it was only £700, and there was a great deal of game upon it then. He had occasion to pass it frequently, and he did so only the other day, and the game seemed more abundant now than ever, and the present rent was more than £1,000, and the present tenant seemed thriving, looked well and smiling.

The CHAIRMAN remarked he thought he had been misunderstood in his statement about farmers rearing game. He qualified his statement by saying that it was not at all likely that farmers would rear game, although he believed there were certain foolish farmers who might rear game. They must admit there were foolish ones amongst them. As to Mr. Young's observation that the subject was too political for a meeting like the present, he (the chairman) found the subject so mixed up with politics that he did not see how he was to separate them, and he could not do otherwise if he were to treat the subject again.

This concluded the discussion.

CONTAGIOUS DISEASES (ANIMALS) ACT.

DEPUTATION TO THE DUKE OF RICHMOND.

The Duke of Richmond has received a deputation from the local authorities of the counties of Aberdeen, Banff, and Moray, within the Gordon Schools, at Huntly, for the purpose of hearing representations regarding the operation of the Cattle Diseases Acts. The deputation consisted of Sheriff Comrie Thomson, Mr. J. W. Barclay, M.P., and Col. Innes, of Learney, as representing the Aberdeenshire Local authority; Sheriff Gordon representing Banffshire; and Dr. McLean, Provost Cameron of Elgin, and Mr. Geddes, Orbliston, representing Morayshire.

SHERIFF THOMSON introduced the deputation, and explained that they represented the local authorities of the three counties who thought it desirable to submit to his Grace their views as to the amendment of the cattle diseases legislation. Deputations from the several local authorities now represented had met at Keith on Saturday last, and agreed upon certain suggestions to place before his Grace. As one of their number had been a member of the Select Committee of the House of Commons on this subject last session, and had much experience in practically dealing with the subject, he proposed that Mr. Barclay should state the views of the local authorities.

Mr. BARCLAY said he should endeavour very briefly to state the reasons which the local authorities had in support of the suggestions which he had now the honour of submitting to his Grace, but before doing so he might be allowed to observe that the suggestions were not of the nature of theoretical objections to the cattle disease legislation, but practical difficulties and hindrances which the local authorities had experienced in proceeding to carry out the Acts and Orders in Council with efficiency. The first suggestion was that the period of thirty days, provided by the pleuro-pneumonia regulation, was not sufficiently long, and the meeting at Keith were unanimously of opinion that this period should be extended to sixty days. They did not say that even this lengthened period would be altogether sufficient to determine whether disease continued to exist at the infected place or not. Pleuro-pneumonia was in his opinion much more difficult to deal with than rinderpest. The period of incubation, or the time during which disease might exist in an animal without manifesting external symptoms, was sometimes very protracted, and they had instances where three, four, or even more months had elapsed before the disease again manifested itself. But if the period were to be extended beyond sixty days, very grave hardship would arise to the owner of cattle, and it might easily be the case where one animal took it after another at considerable intervals, that the farmer might be prevented from removing apparently healthy stock from his farm for twelve months. Looking at the question practically, they were of opinion, in the whole circumstances, that sixty days was the period to which the control of the local authorities should be extended. The second suggestion, that the slaughtering provisions of the Act should be carried out the same in Ireland as in England and in Scotland, was, he believed, by far the most important question which he had to submit. In urging this point, the local authorities did not assert that there was more disease in Ireland than in this country, neither were they actuated by any hostility towards the Irish farmers. Indeed, he believed that the slaughtering-

out of pleuro-pneumonia in Ireland would be of greater advantage to the Irish farmers than even to the English and Scotch. He was quite satisfied that he was speaking within the due limit in stating that the value of Irish store cattle was depreciated not less than from ten to fifteen per cent, by the suspicions which existed in regard to their being affected with disease. Experience had shown so strongly the danger of purchasing Irish cattle that it was considered to partake of recklessness on the part of farmers to purchase them, unless they had within themselves facilities for keeping such animals isolated for a considerable period from the rest of their stock. But Irish store cattle could not be dispensed with in the Southern counties. The farmers were as glad to have them as the Irish farmers were to sell them, and it was therefore very evident that any measure which tended to increase confidence in the health of Irish cattle would be quite as beneficial to the farmers in Ireland as it would be to the farmers on this side of the Channel. The local authorities were quite satisfied that the disease in these northern counties was due to the import of cattle—particularly of Irish cattle—and he did not make this statement without being able to support it by facts. The local authority of Aberdeenshire had instructed their inspectors to investigate the circumstances of every new outbreak of disease, with a view to ascertain its origin. The inspector, in consequence, had inquired into the various cases of disease, and his report was to the following effect: In 1871 there were 30 new outbreaks of pleuro-pneumonia in Aberdeenshire, and 11 of these were traced directly to cattle brought into the county. In 1872 there were 34 outbreaks, and of these 15 were directly due to imported cattle. In 1873 there were 12 cases, and 7 of these were due to imported cattle. As stated, 26 cases were due in 1871 and 1872 directly to imported cattle, but it was found that other 21 cases had sprung directly from these 26; so that out of 64 new cases in 1871 and 1872, 47 were traced to imported cattle. The inspector failed to trace the remaining 17. Now, of the 26 cases directly due to imported cattle the cattle which brought the disease were in 15 cases from Ireland; in 8 cases from Holland; in 4 cases from England; and in 4 cases from other Scotch counties. He did not assert, as he had already stated, that disease was more rife in Ireland than in England and Scotland, but the mischief arose in this way. If one or two animals from an infected place, and containing the germs of the disease, were presented for shipment, no inspector at the port of shipment or elsewhere could detect the disease in its initial stages. One or two animals affected with pleuro-pneumonia pent up in the hold of a vessel, along with many different lots, might infect one or two in several of these lots, and so by only one or two diseased animals in a cargo, the disease might be communicated to the different lots and be thus spread widely over the country. The local authorities there represented had strenuously endeavoured to carry out the provisions of the Act with regard to slaughtering affected animals; and, so far as regarded disease within the county, they had every reason to believe that they would soon succeed in entirely exterminating it; but it was extremely discouraging to find that as they succeeded in exterminating the disease which existed within the county, it was again brought in afresh from

other parts of the country by infected animals. He had reason to believe that the same feeling of disappointment was experienced in several districts of England, and he had no doubt that in the coming session of Parliament strong representations would be made to his Grace to rescind the Order in Council providing for slaughtering. He had been specially directed to state that the opinion of the local authorities now represented was strongly in favour of the expediency of slaughtering out animals affected with this disease. Indeed, the evidence taken before the Select Committee last session was all but unanimous in the conclusion that slaughtering animals affected with pleuro-pneumonia was the most advisable course both in the interests of the owner and of the public; and he believed he was strictly correct in saying that no diversity exists on this point among the numerous witnesses from Ireland who were examined before the Committee. As regards Aberdeenshire, the clerk to the Local Authority had prepared a statement of the experience of the last three years (which we give in the table annexed hereto, and a copy of which was submitted to the Duke), showing that the average cost to the country during the last three years, during which slaughtering had been carried out, had been three-farthings per pound on the assessable rental—one half payable by the landlords and the other half by the tenants. The third suggestion desired the Privy Council to take measures to ensure the active and uniform enforcement of the law amongst all local authorities throughout the kingdom; and in support of this he referred to the figures which he had previously given, showing that of those cases of disease in Aberdeenshire a certain number were due to cattle from England, as well as from other countries in Scotland. The fourth suggestion proposed the amalgamation of county and burgh local authorities in Scotland. No doubt the burgh and the county local authorities in the counties which they represented had acted with great unanimity and cordiality together; but such had not been the case in certain parts of Scotland and England. In a few cases the burgh local authorities seemed to consider that their interests were antagonistic to those of the county local authorities. He referred to a case which had occurred in Scotland, where the county local authority had prohibited the import of cattle, but the burgh local authority had failed to do so. A large number of cattle was brought into the county to a market held within the burgh. Farmers brought largely at the market, took the cattle into the county; and the breaches of the law were so numerous, besides being inadvertent, that the authorities failed to prosecute. No great harm had directly arisen in this case; but when certain regulations were set at naught in this manner, it threw discredit upon other more essential restrictions. Provision would be made for assessing the general expenses over the whole district rateably, and the expenses of slaughtering would, it was contemplated, fall exclusively on that burgh or landward part of the county wherein the cattle were slaughtered. The fifth suggestion was expressing the desirability of simplifying and consolidating the Order in Council, and of adopting a settled policy in dealing with cattle disease by the Government, in order that the local authorities and the public generally might become acquainted with the regulations. Speaking generally, the local authorities were of opinion that the regulations and restrictions should be the minimum absolutely necessary; that such regulations and restrictions as were imposed should be rigorously enforced throughout the whole country; and that discretion should not be left with local authorities, but made generally imperative by an Order in Council. When the Orders were permissive, some local authorities proceeded stringently; others neglected to take measures; and experience had abundantly shown that unless uniform measures were carried out throughout the whole country, it was useless for exceptional local authorities to be more stringent than their neighbours. The carrying out of the Act was at first no doubt expensive, but experience would enable them to reduce the cost very considerably; and if the slaughtering-out policy were carried out in Ireland, and vigorously throughout England and Scotland, he had no doubt that, within a reasonable time, that policy would be attended with complete success.

Provost CAMERON said that the amalgamation of county and burgh local authorities would tend very considerably towards economy, as well as to efficiency in the carrying out of the Act. Under the existing law, regulations had to be made and advertised both by the county and burgh local authorities, with double meetings and officials. There would be no diffi-

culty in one local authority administering the Act for the whole country.

Sheriff GORDON said some doubt existed as to whether sixty days was sufficient time to elapse before declaring an infected place free. The Banff local authority considered three months necessary, but he thought that it might be placed in the discretion of the Privy Council to grant powers to such local authorities as might want to extend the time beyond the sixty days. With regard to the amalgamation of the county and burgh local authorities, he was not aware what the opinion of the Burgh of Banff was on this subject. He was strongly persuaded of the necessity for simplifying and consolidating the various Orders in Council, in order that Local Authorities might have no doubt as to the powers they possessed.

The Duke of RICHMOND said he was very glad to have an opportunity of hearing the views of the local authorities of the three counties on the practical operation of the cattle disease legislation. It was his duty, as President of the Council, and having this department in charge, to make himself acquainted with the operation of the Acts; and he naturally, as a landed proprietor in each of the three counties, took a lively interest in the subject. With regard to the period during which a place was made subject to the pleuro-pneumonia regulations, that was not within his control as President of the Council, but was specially provided for by the Act of Parliament. To alter the period, an amending Act would be necessary. The proposal to slaughter-out cattle affected with pleuro-pneumonia in Ireland was one of considerable difficulty. Amongst other difficulties he might refer to this, that local machinery for carrying out the Act did not exist in Ireland, as in England and Scotland. As they were doubtless aware, the Act was carried out from the central authority—the Lord-Lieutenant—chiefly by means of the police; and it was doubtful whether there was a sufficient number of qualified veterinary surgeons to enable the central authority to carry the slaughtering provisions of the Act into effect, and at the same time to secure the confidence of the country. He had had the subject under consideration during the past session, and had been in communication with Sir Michael Hicks Beach, the Under-Secretary for Ireland. He did not say that the difficulties which he had stated were insuperable. The subject was still under consideration, and he should be glad if he and the Irish Government could see their way to enforce the slaughter of animals affected with pleuro-pneumonia in Ireland. With regard to the inspection of Irish cattle which had been incidentally referred to, he had, early last session, arranged with the Chancellor of the Exchequer for additional inspectors, some of whom had been appointed then, while others had been appointed quite recently. He had been informed that the cattle were marked in such a manner on leaving Ireland that if any animal was found to be affected with disease, the mark upon it enabled the inspector to state the date of shipment and the farm from which the animal had been brought. If the local authority found cause of complaint against any Irish cattle, they ought to communicate with the veterinary department in London, in order that the animal might be traced; but, as he was informed, there had been very few, if any, complaints of that nature.

Dr. M'LEAN expressed his belief that a very considerable amount of disease was due to bad treatment of the cattle in the transit from Ireland to this country, and certainly the confinement in the holds of vessels, and the subsequent exposure, would develop the germs of the disease.

Mr. BARCLAY agreed that the evidence before the Select Committee last year showed that confinement in the holds of vessels, and subsequent exposure, developed the germs of the disease in cattle, but did not produce contagious pleuro-pneumonia, which all the witnesses agreed in saying to be a disease of foreign origin, which had been brought into this country, and subsequently propagated and continued by contagion. Ordinary pleuro-pneumonia would be produced by exposure and hard treatment; but although similar in external symptoms, it was a quite different disease from contagious pleuro-pneumonia.

The Duke of RICHMOND was aware that a very general opinion prevailed that the proper course to deal with pleuro-pneumonia was by slaughtering-out the animals; but he might say that he had already had a deputation from Yorkshire, pressing upon him the expediency of rescinding the slaughtering Order in Council. He should be very glad if the various

local authorities could be induced to carry out the Acts efficiently, but he did not know what further steps the Privy Council could take to that end. He should be glad to hear any suggestions on this point.

Colonel INNES suggested that the slaughtering-out of cattle, with the view of preventing disease, ought to be looked upon as a national question quite as much as a farmer's one, and he believed that inquiry would show that disease, by enhancing the price of meat, was of greater importance to the general consumer than even to the farmer, who was recouped for his loss by the trifling assessment of three-eighths of a penny in the pound. It seemed to him that it was a proper subject for consideration whether part of the general expenditure might not be paid out of Imperial funds, the Government, on the other hand, having some direct control and supervision in the carrying out of the Act.

Sheriff THOMSON said that, as regards the Government supervision, there was a precedent, to a certain extent, in the case of the police. The counties managed them, but there was a Government inspector.

The Duke of RICHMOND, with regard to the amalgamation of county and burgh local authorities, thought that that was a proposition which might be practicable in Scotland, but he feared it would be impracticable in England, where the burgh and county local authorities seemed to consider in some cases their interests antagonistic. His Grace having referred to the question of foot-and-mouth disease,

Mr. BARCLAY explained that, although the subject was not referred to in the memorandum submitted to the Duke, it had been discussed at the meeting of the local authorities in Keith last week. The representatives of the local authorities there present were unanimously of opinion that it was in expedient to attempt to deal with foot-and-mouth disease by special restrictions or regulations, and that it ought to be left simply under the operation of the general Act, which provided that persons exposing animals affected with foot-and-mouth disease in a market or public place, or by driving them along a highway, were subject to penalties. The local authorities had come to this conclusion, not because they thought foot-and-mouth disease a trifling matter—or they were of opinion that foot-and-mouth disease on the whole caused far greater loss than pleuro-pneumonia—but the result of their experience showed that any restrictions which could be enforced had little effect in putting down the disease. The restrictions might make the progress of the disease less rapid, but they seemed powerless to prevent the disease from spreading over the country; and, indeed, it had been urged, not without a certain amount of force, that the restrictions were rather harmful than otherwise. It was considered that the more rapidly the disease spread over the country, the sooner it was got clear of altogether, as, like epidemics, it would in a definite time exhaust itself. The restrictions retarded the course of the disease, and by the time it had got over the country a new crop of animals had grown up to come under the influence of the disease. The local authorities of these three counties had passed the most stringent regulations in their power regarding foot-and-mouth disease, and had endeavoured to carry them into effect most stringently, but yet they could not say that any beneficial effects had resulted, and if any beneficial results did arise from the restrictions, they certainly did not equal the trouble and inconvenience which were occasioned by them.

Dr. McLEAN said that the local authority for Morayshire, quite concurred in the views expressed. In their experience, foot-and-mouth had not been a fatal disease.

The Duke of RICHMOND said very strong representations had been made to him, to issue very stringent regulations in regard to foot-and-mouth disease; but he understood the experience of the local authorities here did not support further restrictions. He quite agreed in the desirability of simplifying and codifying the Orders in Council, and indicated that this would have his consideration.

Provost CAMERON suggested that a new Order in Council might be issued, rescinding all previous Orders in Council, and embodying in itself the whole of the provisions of the Privy Council.

The Duke of RICHMOND said, that of course new Orders in Council were required from time to time.

Sheriff THOMSON remarked, that if a settled policy were adopted by the Government, new Orders in Council would refer almost entirely to the regulation of the import of foreign animals, and would not affect the action of authorities inter-

nally, or as to cattle within their respective districts. The Sheriff concluded by thanking his Grace on behalf of the deputation, for the patient attention and courtesy with which their representations had been received.

The deputation then withdrew.

The following is the table referred to by Mr. Barclay:

Period.	No. of Place infected.	No. of Cattle on infected Places.	Value of Cattle on infected Places.	No. of Cattle Slaughtered.	Value of Cattle Slaughtered.	Amount realised by Sale of Carcases, Hides, &c.	Loss.	Amount of Compensation paid to Owners.	Total.
From 14th April to 31st December, 1871	30	867	£13,697	237	£3,943	£5,344	£1,699	£1,161	£1,161

STATUTE HIRINGS.—A circular on the subject of the hiring of servants has just been issued by the Howdenshire Chamber of Agriculture. It states that great inconvenience has resulted from the increasing practice of servants sending back their "earnest money," and refusing to fulfil the engagements they entered into at the statutes, which have usually been held about a fortnight before Martinmas. In several instances employers have sought redress from the magistrates when thus left in the lurch, but it has been decided that as the engagements were legally from the day of hiring until Martinmas of the ensuing year, they were not binding unless

put into writing, a parole contract not being legal or valid for any period exceeding twelve months. Much dissatisfaction has naturally been felt with these decisions, and the Howden-shire Chamber has appealed against one of them to the Court of Queen's Bench, but the case has not yet come on for hearing. The simplest way to remedy this defect in the law would doubtless be the universal adoption of written contracts, but servants, and some masters also, have such great objection to signing written documents that it does not seem at all likely it could be carried out. There are many objections to holding the statutes before Martinmas, amongst which are the loss of time sustained by the absence of servants so near the end of their contract, and the great unsettlement and frequently recklessness and idleness shown by many of them

during the rest of their time. The circular concludes by suggesting that in order to prevent this state of confusion, uncertainty, and loss, the statute hirings should all be held in Martinmas week. Three advantages would be derived from so doing. 1. The contracts would then be valid. 2. There would be no unsettled time between the holding of the first statutes and the leaving day. 3. A greater disposition amongst masters and servants to complete contracts for future service without unnecessary loss of time. A copy of the circular has been sent to all the neighbouring Chambers, with a request that they will co-operate with the Howden Chamber in endeavouring to secure the settlement of what is now a vexed question to many employers of labour in the agricultural districts of the country.

L I V E R P O O L.

Compared with Bristol, Liverpool is a town of yesterday. It was late in taking a start, but a time came when the advantages of its position and the energies of its people quickly placed it in the front rank of English towns. Not even Birmingham surpasses it in the prodigious rapidity of its growth and the largeness of its development. Very old men can remember it as a comparatively small place, and can trace its marvellous increase in wealth, population, and splendour emerging from a small fishing-village and growing into the second seaport of England. Old citizens still narrate with a glow of pride how rapidly the magnificent docks extended from mile to mile along the side of the noble Mersey; how streets of mighty warehouses seemed to arise; how in quick succession Exchange, Townhall, Corporate buildings, hospitals, churches, and shops rivalling those of London were erected to meet the never-ceasing demands of this wonderfully increasing town; and how, after having covered the Lancashire side of the river with evidences of growing wealth, active industry, and civic prosperity, the never-sleeping energy of its merchant princes and great ship-builders crossed the watery barrier, and how a mighty town, with similar proofs of riches, rose on the Chester side of these waters crowded with shipping. Liverpool is one of the crowning illustrations of the commercial and industrial capacities of the English nation. A very brief glance at the past will suffice to bring us to the Liverpool of our own day. The most popular of its many derivations is that which traces its name to a mythological sort of a bird called "lever" or "liver," though no such bird has ever been known to exist; but, in confirmation of this theory, the crest of the borough arms is to this day the figure of this identical bird! Anyhow, it is beyond question that in early times Liverpool was very small and insignificant. In the time of Edward III.—1328-77—it consisted only of five streets. Some 170 years later, in Henry VIII.'s reign, Leland thus described it: "Lyrpale, *alias* Lyverpole, a prond town, hath but a chapel. Walton, *four miles off, not fur from the sea, is the parish church.* The King hath a castele there, and the Earl of Derby bath a stone house. Irish merchants come much thither, as to a good haven. At Lyrpale is small custom paid; that causeth merchants to resort. Good merchandise at Lyrpale; and much Irish yarn, that Manchester men do buy there." In Elizabeth's reign the town made some progress, but not much; although Camden relates that it was then the "most commodious and the most frequented route to Ireland." He adds that it was more remarkable for elegance and populousness than for antiquity. In this and the succeeding reign the number of its freemen nearly doubled. There was, however, little promise of its present greatness; and Liverpool was in the reign of Charles I. a very poor place indeed. This is shown in the ratal for ship-money. When these unhappy and mischievous councils prevailed, and the King issued his writs for this levy, while Chester was charged with £100, and Bristol at the then very large sum of £1,000, Liverpool was rated at only £15. And the High Sheriff of Lancashire wrote to the authorities: "If you shall tax and assess men according to their estate, then Lyverpole being poor, and now goes, as it were, a begging, must pay very little." At the beginning of the Civil War Liverpool was seized by the Royalists. It was then besieged by the forces of the Parliament, who after a severe contest won it, driving the Royalists out with considerable loss. The fact that this

port was the direct route to Ireland rendered its possession of great importance to both parties, and accordingly Prince Rupert again laid siege to the place; but it cost him and his army eighteen days, a hundred barrels of gunpowder, and the loss of some 1,500 men before the crow's nest was taken. In November of the same year it was surrendered again to the Parliament, after a siege of fifty-five days both by sea and land. During the eighteenth century the progress of Liverpool was enormous. In 1700 the population was 5,714; in 1800 it had risen to 75,000. Mr. Leone Levi states that in 1773 "the population of Liverpool was ascertained to be 34,000. She possessed only three floating docks, a tolerably-sized basin, and three graving docks. The gross receipts of customs in 1775 were £274,000; and in that year eighty-one ships of 9,200 tons cleared from Liverpool for the African or slave trade. In 1775 there was only one letter-carrier for all Liverpool, and the mail-bags were carried in and out of the town on horseback." This was the period during which the slave trade flourished and was a source of untold riches to Liverpool, which shared with London and Bristol the profits and the shame of this iniquitous traffic. When Clarkson went on his merciful mission of inquiry, he found that, while eighteen vessels engaged in this trade sailed from Bristol, no fewer than eighty left Liverpool. He heard "horrible facts" from everybody; the people were more hardened, and talked on the subject with more cool indifference than in any other seaport. This he assigns to their greater familiarity with the cruelties incidental to the traffic. The Liverpool people, too, were exceptionally bitter and furious in their opposition. More than once the apostle of abolition was threatened with personal violence, and on one occasion only narrowly escaped from being thrown into a dock to drown; and drowned he would have been immediately, for no one would have attempted his rescue. Liverpool was thoroughly roused in the defence of what she considered the most important source of her wealth and the most valuable of her vested interests. The earliest attempts to legislate on this subject were rigorously opposed by the members for Liverpool, who in this only obeyed the all but unanimous wishes—nay, indeed, the commands of their constituents. Mr. Gascoyne declared abolition to be unnecessary, visionary, and impracticable." Petition on petition was poured into the House of Commons opposing all steps towards abolition, and proclaiming that utter ruin would follow such pernicious and injurious legislation. Through the twenty years' agitation by which the abolition of the slave trade was preceded the influence of Liverpool in opposing the measure was second only, if even it were second to that of London. Liverpool was not ruined by the abolition of the slave trade, as its opponents gloomily prophesied. On the contrary, the town took a wider, a nobler, and a more rapid course in progressive prosperity. During the present century her career has been one of extraordinary growth and development. A writer who is fully informed on the subject says: "Rapid as was the progress of the commerce of Liverpool in the last century it is more than equalled in the present day. From the large share the merchants possessed in the African slave trade it might have been apprehended that the cessation of that traffic would have seriously affected their interests. But it was not so. A succession of causes continually tended to open up fresh channels for enterprise and to give increased facility to mercantile operations. The most powerful of these was the

warehousing system, which gave all the advantages of a free port to one possessing so many natural and artificial advantages. It was followed by the partial opening of the trade to the East Indies; next by the introduction of steam navigation; and, during late years, by the complete abolition of the East India Company's monopoly. In addition to these causes the rapid advance of our original descendants in the New World in wealth and population has called into operation the intercourse chiefly carried on through this port. Lastly, with her skilful engineers and fortunate position as the outport of a country abounding in mineral fuel, she holds the sinews of that mighty power which is extending its conquests over the wide world; walking the waters through storm and calm, and bridging the Atlantic itself; gliding over the peopled plains of the Old World, through the eternal forests of the New, and as it passes along scattering in its train civilised man, his energies guided by Christian knowledge and by his expanding wants and national desires." In proof of this marvellous accretion it is only necessary to mention the increase of population since 1800. It was then, as I have already stated, about 75,000; in 1861 it was 443,938, and at the last census in 1871 it was 493,346—thus in seventy years showing the enormous increase of 418,346 persons. Figures are not always interesting reading, but in most cases it is only by figures that we can obtain anything like a comprehensible and accurate idea of the extraordinary development of our great towns during the present century. The political influence of Liverpool has generally been exercised in the Conservative interest, but in the great Reform agitation a large and influential Union was founded, which co-operated with that at Birmingham in its active support of the bill. Petitions very numerous signed in favour of the measure were sent to Parliament, and a vast amount of Liberal enthusiasm prevailed. This was, however, of short duration, and in less than three years after the passing of the bill the burgesses returned to their favourite political side. The second general election after the passing of the Act was in January 1835, and then, notwithstanding the extension of the suffrage and the enlarged register produced by the addition of the ten pound householders to the number of voters, the Conservatives headed the poll. Since that time the public influence of Liverpool has almost uniformly been Conservative. This state of opinion in such an active community, added to the great change which within a few years has taken place at Manchester, will afford some explanation of the general Conservative reaction by which nearly the whole county of Lancashire was so signally distinguished at the last election. During the American civil war Liverpool ardently sympathised with the Southern States, and all her influence was exerted in that direction. A large number of privateers were fitted out in, and sailed from, her docks in their hazardous and illegal enterprises. Persistent but unsuccessful efforts were made to induce the English Government to recognise the Southern States. At Birkenhead, a place which bears the same relation to Liverpool as Gateshead does to Newcastle-on-Tyne, Salford to Manchester, and Aston to Birmingham—in fact for political purposes the two places may be considered as one—at Birkenhead the Messrs. Laird built for the Confederates the vessel which, under the name "Alabama," won such a notoriety as a privateer, and drew this kingdom into a series of difficulties which at any moment might have led to war, and which ended in inflicting a heavy penalty on the nation. Beyond question, Liverpool must be credited with the chief of those acts which after ten years of mutual recrimination led up to judgment against us in the Court of Arbitration at Geneva. Liverpool is the birth-place of an association which is slowly growing in importance, and which promises at no very distant date to exercise a great influence on public opinion. To various large towns has been given the accomplishment of some particular public work as the crowning glory of its public life and history: to Birmingham the first Reform Bill, to Manchester the repeal of the Corn Laws, and it appears all but certain that to Liverpool will be given the no less important labour of systematising and reforming our national finances. In April, 1848, the Financial Reform Association was founded. Its objects briefly stated are "economical government, just taxation, and perfect freedom of trade." Its method is to create an educated public opinion on all subjects connected with taxation, national expenditure, and the influence of imports and duties on trade and commerce. To effect this end tracts on every part of our financial system, on taxation in all its branches, aspects, and

bearings, its incidence and its application, are printed and widely circulated. Lectures on similar subjects are delivered by thoroughly well informed gentlemen in the different towns throughout the country. Leaflets on how the public money came and went in each past year, and how it is coming and going in the current year are published in large numbers, giving in the briefest possible manner the amount raised from the various sources of revenue and the way in which it is expended; the cause and origin of the National Debt, and the way in which the public burdens have been transferred from the land to the Excise and other taxes; while the advantages of a system of direct taxation over that of Customs and Excise are displayed in the simplest manner. At the end of each year is issued the *Financial Reform Almanack*, in which is presented a vast amount of "tabulated, fiscal, commercial, social, and political information," all relating to the objects of the association, and furnishing in a clear and lucid manner a complete history of taxation as it affects the life and industry of the nation. Since July 1858, the association has published a monthly paper entitled the *Financial Reformer*, the recognised advocate of its objects, which are: 1. "To use all lawful and constitutional means of inducing the most rigid economy in the expenditure of the Government, consistent with due efficiency in the several departments of the public service. 2. To advocate the adoption of a simple and equitable system of direct taxation, fairly levied upon property and income, in lieu of the present unequal, complicated, and expensively-collected duties upon commodities." In this work "political partisanship is distinctly disowned, the association being composed of men of all political parties." In illustration of the influence already exercised by this association we have only to read a speech delivered by Mr. Bright at a large meeting which it held in Liverpool, in December 1859, the views which he advocated being adopted as those of the association. The speaker proposed the repeal of taxes which pressed on the bulk of the people and on precarious incomes, and the substitution of others on property producing fixed incomes; the abolition of the Income-tax, the assessed taxes (except the house tax), taxes on marine insurances, fire insurances, and the duty on paper; the remission of all duties from the Customs tariff, except on foreign wines (and that these should be reduced from 5s. 6d. to 1s. on the gallon), foreign spirits, and tobacco. These proposals would have reduced the revenue by more than £26,000,000; to meet this loss he suggested a tax of 8s. per cent. on all persons whose property was more than £100, which would produce £27,000,000, or an excess of £1,000,000. As to the wisdom or justice of these proposals I am not now called upon to express an opinion; I give the statement to show the influence which the Reform Association has had on the subject of taxation. Since this speech in 1859 the assessed taxes have been lessened, the duties on marine and fire insurances taken off, the paper duty abolished, and the Income-tax made small by degrees and beautifully less. This epitome of the gradual change which is taking place in the public mind on the subject of taxation is a sufficient proof of the influence which this non-political association of Liverpool has exercised during its existence, and is, doubtless, a prophecy of still greater fiscal reforms which it will effect. Mr. Cobden gave his full adhesion to its objects. In all that concerns their local life and institutions the spirit of Liverpool is rivalled by few large towns, and surpassed by none. In its public expenditure the corporation, which is very rich, rarely counts the cost if it is necessary that a great work should be done. Over £900,000 has been expended in constructing the splendid system of sewerage, in perfecting which "no expense or care seems to have been spared." The Town Hall cost upwards of £110,000, and the Exchange more than £360,000, while some £400,000 was expended in the erection of St. George's Hall and the Assize Courts. All the public buildings are on a similar scale of magnificence, the charities are numerous and munificently supported, the docks are the admiration of strangers from all parts of the world. For some time past Liverpool has run a neck-and-neck race with Bristol as to which place should be the most heavily rated in the kingdom. The munificence of many of her wealthy citizens is princely. A free Library has been established for twenty-one years, and in 1837 Sir William Brown, Bart., began the building of a fitting receptacle for the literary treasures of the town. This was finished in 1860, at a total cost of £40,000, the whole of which was borne by the generous donor. The Report for 1873 is now before me. I find that at the end of that year the reference library con-

tained 56,828 volumes, and during the year there had been 489,270 issues. There are also two branch lending libraries called the north and south: the former contains 20,031 volumes, and the latter 20,799, making a total of 40,830. The united issues of books in 1873 were 422,531. During the same period 428,501 persons visited the museum. A free art gallery has been greatly needed in the town, and, to quote from the last report of the free libraries committee, "an attempt was made without success during the past year to gain the aid of the council towards the erection of such a building, and subsequently offers of contributions were made by private individuals to the extent of £7,000 for the same purpose. The public, however, did not come forward in response, and the whole project was on the eve of a collapse when the Mayor, Mr. A. B. Walker, nobly came to the rescue, and immediately after his election to the chair on the 10th of November announced his intention of devoting the sum of £20,000 to the erection of a building for an Art Gallery." Thus two citizens alone will have devoted the sum of £60,000 for the proper location of works of literature and art. The new building is to be called "The Walker Art Gallery." It is a fact full of healthy promise and rich in encouraging example that so many of our large towns have been remarkable, not only for having organised and carried to a successful issue some one great public question, but having exercised a co-operative influence in moulding and forming public opinion on all questions that affect the general well-being of the nation. This distribution of power and this influence shared with so many other places render it sometimes a little difficult to trace accurately what has been the particular influence which this or that town has exercised on questions of public policy, and still more difficult to point out its exact bearing and show its precise extent. In cases of broad political changes, such as the effect of Birmingham on the Reform Bill of 1832, of Manchester on the repeal of the Corn Laws, and of both places on the question of national education, the lines are very clear and distinct. Liverpool has exercised an enormous public influence in various ways during the present century, but not in carrying any particular law or in repealing any old statute by which her name has been imperishably associated and in which her influence was paramountly displayed. In the discussion and settlement of most modern questions she has had a "voice potent" but it has been a voice united with other voices, and not so much a distinct and separate power which, acting alone, would have decided the fate of a measure or created and destroyed governments. In producing the great Conservative reaction which dethroned Mr. Gladstone and placed Mr. Disraeli in power the influence of Liverpool has been very great. It was mainly through this influence that Mr. Gladstone lost South Lancashire in 1868, and since that year the county has been one of the most active forces in giving a Conservative turn to the electoral power of the country. The eight members returned for the four divisions of the county of Lancashire were all Conservatives. In Liverpool the two Conservative candidates headed the poll by large majorities, Mr. John Torr, the junior member, having upwards of 3,000 votes more than Mr. W. Rathbone, the elected Liberal candidate; and but for the operation of the provision in the last Reform Bill by which no elector in a constituency returning three members can vote for more than two, three Conservatives would in all probability have been returned. As an indication of the growing influence of the Financial Reform Association it may be stated that Mr. Torr declared himself "in favour of a reduction of the public expenditure." At Manchester the two Conservatives were also returned at the head of the poll, and one of the rejected candidates was Mr. Jacob Bright. Liverpool and the county generally is well represented in the Government: Lord Derby being the Secretary for Foreign Affairs; Viscount Soudon, one of the members for Liverpool, Vice-President of the Council; and the Right Hon. R. Assheton Cross, one of the members of the south-western division of the county, Secretary of State for the Home Department; the Hon. Algernon F. Egerton, member of the south-eastern division, is Secretary to the Admiralty; and the Hon. Frederick A. Stanley, member for the northern division, is one of the Under-Secretaries of War. This is pretty well for one county. But the appointments in their relation to the county have been well deserved, owing to the great influence which Liverpool in particular and Lancashire in general have had in producing that state of affairs which has made them

possible. At the present time Liverpool is engaged in a public work of such magnitude as to partake more of the character of an imperial than a provincial undertaking. The extent of her docks is enormous, but the existing system, great as it is, is not sufficient for the accommodation of her ever-increasing maritime requirements, and it is now being extended in a manner characteristic alike of the enterprise and wealth of this great town. The extension of the docks now in course of construction is for the accommodation of the steam trade. The new docks will occupy the space reclaimed from the foreshore of the Mersey between the north quay of the Canada basin and the Seaforth shore. The area of this space is nearly 1,365,000 square yards, the length about 6,200 feet, and the breadth 2,000 feet. It will be fronted by a wall of enormous strength, which will be faced with granite. At the back of the wall a public promenade will be laid out, which will, doubtless, form one of the most pleasant and attractive places of summer resort in or near the town. The cost will be very great, and the whole work will be one more monument added to the many already existing of the honourable public spirit of the people of Liverpool. Visitors to Liverpool at intervals of only a few years are habitually astonished at the rapid changes in the town and the tokens of marvellous growth. Again and again have I been struck with amazement at the new streets, new buildings, mighty warehouses, and palatial structures which have sprung up, seemingly by magic, during my comparatively brief absence from the town. This wonderful material progress of Liverpool—these manifest proofs of restless energy united with exhaustless wealth—produced a marked impression on the mind of Lord Erskine. Writing of a visit to Liverpool he says: "I had before often been at the principal seaports in this island; and, believing that, having seen Bristol and those other towns that deservedly pass for great ones, I had seen everything in this great nation of navigators on which a subject should pride himself. I own I was astonished and astounded when, after passing a different ferry and ascending a hill, I was told by my guide, 'All you see spread out beneath you—that immense plain, which stands like another Venice upon the water—which is intersected by those numerous docks—which glitters with those cheerful habitations of well-protected men—which is the busy seat of trade, and the gay scene of elegant amusements, growing out of its prosperity—where there is the most cheerful face of industry—where there are riches overflowing, and everything that can delight a man who wishes to see the prosperity of a great community and a great empire—all this has been created by the industry and well-disciplined management of a handful of men since you were a boy.' I must have been a stick or a stone not to be affected by such a picture." These feelings must have been experienced by all who, like the present writer, have stood many, many times during the last half-century, and traced the continual growth and mighty expansion of this queen of English seaports.—*The Gentleman's Magazine*.

HOW TO JUDGE OF WOOL.—There is perhaps no defect which renders wool, and other wise good wool too, so absolutely useless for manufacturing and especially for combing purposes, as tenderness, or breachiness; and it is my conviction that this defect is more general and causes greater loss to the country, through the pockets of our sheep-owners, than all the other defects in our wools together. However fine, or however much your wool in every other desirable quality may excel, no sooner is it submitted to the wonderfully acute and skilful examination of the European wool-sorter, classer, buyer, or manufacturer, than its deficiency in this respect is detected, and a price is bid for it scarcely exceeding that offered for locks and pieces; in fact, nothing is wanting to reduce fleece to that class, but the solution of continuity which is sure to take place in the course of the very first manufacturing process to which it is subjected. Except, however, possibly, in cases where neglect or mismanagement have been the rule for generations, it is not hereditary; nor is any one breed of sheep more liable to it than another. To these conclusions I have come by repeatedly finding an entire flock affected with break one year, and quite free from it the next, in consequence of a change in management. On the whole, it is to be feared that this defect is yearly gaining ground; and I am credibly assured

that for the last two or three years we have produced more wool of this description than was ever known before. Certain it is that wheresoever this most objectionable tendency manifests itself, sheer carelessness, neglect, ignorance, overstocking, inordinately large paddocks, or scarcity of feed or water—each or all—will be found. When sheep get into very low condition, the pores of the skin contract, and permit only wool of a very fine fibre to extrude. When the feed once more becomes abundant, the pores again expand, and permit the passage of a larger and stronger fibre. In consequence of this, the extremities of the fibres are stronger than their centres, and the wool upon the slightest strain snaps at the weakest place—namely, at the portion which grew when the sheep were in the lowest condition. But nothing is so sure to cause a break in wool, or indeed, in many sheep, a perfect stripping or shedding of the entire fleece, as want of water. It is not only important that wools should be free from the defects above described, but it is desirable that the whole of the various parts of the fleece should have as nearly as possible a uniformity of character—that is, as regards fineness, length of staple, density, and softness. The method of determining this quality of evenness is thus described: "Always assuming that the wool to be inspected is really a

fine wool, we first examine the shoulder at the part where the finest and best wool is usually found. This we take as the standard, and compare it with, in turn, the wool from the ribs, the thigh, the rump, and the hinder parts; and the nearer the wool from these various portions of the animal approaches the standard, the better. First we scrutinise the fineness; and if the result be satisfactory, we pronounce the fleece, in respect of fineness, very 'even.' Next we inquire into the length of the staple; and if we find that the wool on the ribs, thigh, and back approximates reasonably in length to that of our standard, we again declare the sheep, as regards length of staple, true and even. We next desire to satisfy ourselves of the density of the fleece; and we do this by closing the hand upon a portion of the rump and of the loin wool, the fleece at these points being usually the thinnest, and faulty; and if this again give satisfaction, we signify the fact by designating the wool 'even' as respects density. Now to summarise these separate examinations: If you find the fleece of nearly equal fineness from the shoulder to the thigh; of nearly equal length at the shoulder, rib, thigh, and back; and of equal density at the shoulder and across the loins—you may conclude that you have a nearly-perfect sheep."—*Bulletin Association of Wool Manufacturers.*

INOCULATION FOR PLEURO-PNEUMONIA IN AUSTRALIA.

I may unhesitatingly state that I am most decidedly of opinion that inoculation acts both as a remedy and a preventive—as a remedy to a certain but not very considerable extent, but as a preventive with great and almost unflinching efficacy. I am of opinion that the chances of recovery for a diseased beast are improved by subjecting the animal to inoculation, and that uninfected cattle, after undergoing that operation, may be regarded as almost certainly insured against attack, at least for some years. These opinions are the result of a rather too extensive acquaintance with the disease in question, and to a series of experiences which appear to me to leave no room for doubt—experiences, I may also say, which have been purchased at a cost that renders me but too conscious of their value, and of which I shall now therefore proceed to give a detailed account at some length, because I am aware that mere opinions, however confidently or authoritatively expressed, seldom convince, and because I am desirous to convince all such of your readers who are interested in this subject of the efficacy of a process from the adoption of which I have myself derived so much advantage. For these reasons also I shall not deem apology to be necessary if I intrude to some considerable extent on your valuable space. The Clarence River district was for the first time visited by pleuro-pneumonia in 1866, the disease appearing amongst a herd occupying the run adjoining mine on the northern side, and having been introduced, as was believed, by infected bullocks among the teams travelling the road between Tenterfield and the ports of the Clarence. The owner of this herd, being a believer in the efficacy of inoculation, immediately set about to subject his cattle to the process, and being in a favourable position for obtaining supplies of lymph or virus, by the purchase from time to time of diseased bullocks from the teamsters passing through his station, he in the course of a few months, and before the disease had obtained any hold in the district, had succeeded in inoculating his entire herd, and with what result will be shown in the sequel. Not long after this first appearance of pleuro on the north, a partial outbreak of the disease occurred in my immediate neighbourhood, on the run to the south of mine, and a few hundred cattle occupying the infected locality were at once inoculated; but the disease not appearing to spread beyond the limits of a very circumscribed area, and the owner being, in common with the majority of us, sceptical as to the advantages of the process, the inoculation was not proceeded with. Some animals died from the effects of the operation; many others were saved only by depriving them of their tails; and, altogether, the immediate effects of the process were considered so disheartening, while the prospect of ultimate advantage appeared so uncertain, that the general feeling of reluctance to inoculate was rather strengthened and confirmed. Meanwhile, the disease gradually spread, breaking out suddenly now here now there, in almost all parts of the district, but

confining itself in nearly all cases within more or less circumscribed areas on the several runs, destroying but few cattle, and consequently not causing any great degree of alarm. Most of the cattle-owners tried inoculation to a more or less limited extent, but desisted, from motives similar to those mentioned above, my friend on the north alone going steadily and persistently forward with the operation. Matters went on in this manner for nearly a year before the disease showed itself in my herd; and although I had during the interval used every means in my power to obtain reliable information as to the value of inoculation, I found myself, when the enemy was upon me, as much as ever in doubt. Inquiry only seemed to increase uncertainty. The investigations and report of the Victorian Royal Commission had but perplexed the question; and of all those of my friends who, by residence in the southern districts, had acquired some acquaintance with the disease, and whose counsel I sought, the advice of one generally neutralised that of another. At length, however, having resolved to make a trial of the operation, I early in 1867 inoculated about two hundred cows and their calves, occupying three different paddocks, and about a hundred young bulls running in a fourth paddock, in which were also some bullocks and steers which were not at that time operated upon. Symptoms of pleuro had already appeared in some of these paddocks; but so doubtful did I yet feel as to the advantages of the operation as compared with its risks, that I most unfortunately (as will presently be shown) decided not to inoculate my imported bulls, one of each was kept in each of the three paddocks first mentioned. These three more valuable animals were thus alone exempted, while the cows and calves occupying the same paddocks with them were operated upon. After proceeding thus far tentatively, and with considerable misgiving, I, like my neighbours, paused to watch results, and in a few weeks, having lost eight or ten of my most valuable cows from the swelling of their tails, and saved the lives of several others only by the excision of those useful and symmetrising appendages, my doubts as to the expediency of inoculating became stronger, and I took credit to myself for the exercise of caution which had saved my much prized Short-horn importations from subjection to so serious a risk. How far the self gratulation was justifiable we shall presently see. But the danger to be guarded against had not as yet assumed alarming proportions. Throughout the district the disease seemed to have taken a mild form, and had not been to any extent fatal, and we flattered ourselves that there might be something in the climate or in the quality of the pastures of the district which disarmed the malady of its sting, and that here, at any rate, to have recourse to inoculation was to apply a remedy which might prove worse than the disease. Vain delusion, which by ill fortune too generally prevailed—prevailed till the favourable opportunity for inoculation had passed away—prevailed till violently dispelled by a sudden and devastating

spread of the disease, which caused all previous losses through inoculation to appear trivial indeed. This terrible outbreak was simultaneous with the setting in of the autumn rains of 1867. During the months of March, April, and May, the rains were unusually heavy and continuous, flooding the rivers and creeks, and rendering it nearly impossible to work cattle in yards, and very difficult even to collect them. During all this time cattle of all ages were dying by hundreds throughout the length and breadth of the district, the atmosphere was tainted by the decaying carcasses, and miserable animals in all stages of the disease were everywhere to be seen. On my own run, over an extent of the thirty miles, the disease burst forth in every part within two weeks; my three English bulls sickened and died one after the other, many of the bullocks and steers running in the bull paddock also died, while their inoculated companions, the young bulls (one only of which had died after inoculation) and all the inoculated cows and calves in the other paddocks remained unscathed. All hesitation, all doubt as to the value of inoculation vanished now, but nothing could be done, the continuous rains rendered action impossible. Week after week the awful destruction went forward, and we could only look on, and, from week to week, endeavour to hope that the worst had passed. At length the rain ceased, inoculation was vigorously proceeded with, and the plague stayed; possibly the disease had now spent itself, and the remedy came too late. Be that as it may, the disease died away after inoculation had become the general practice, and we could then muster herds and count losses. These, as a rule, were found to be far in excess of the worst anticipations, reaching generally fifty, and in some cases even more than fifty per cent. of the entire herds. In my own herd the loss reached fully fifty per cent., and of the bulls running with the herd quite sixty per cent. It may be thought that this estimate of losses is excessive and erroneous; that owners may have over-calculated the numbers of their herds prior to the visitation, but in the estimate above stated every allowance has been made for such over-estimation, and when it is told that after the plague had passed away the country so far changed in appearance that, instead of a fully stocked, it came to look like a new and unoccupied country, grass everywhere up to a horse's knees, and scarcely any traces or tracks of cattle to be seen. When it is told that in my own herd there was a fall from three thousand calves branded and weaned in 1866, to eight hundred branded and weaned in the following year, it must be seen that the estimate arrived at and above given cannot be regarded as excessive or exaggerated. Your readers may now ask how Iared it during all this disastrous period with my neighbour on the north, that sole and singular true believer of the year before in the virtues of inoculation. I answer that so lightly did the devastating enemy pass over the region under his authority and control, that while the rest of us had to compute our losses by thousands, he could reckon his by scores: and while the other portions of the district became, as I have already said, overgrown with rank grass and assumed an unstocked and deserted aspect, his run alone retained the usual appearance of well-stocked country. During 1868 and the two or three following years, the contrast between the condition of this run and that of the runs surrounding was so striking as to prove beyond question how enormous must have been the difference between the losses sustained here and those sustained elsewhere throughout the district. I have not much more to say, except to give a description of the *modus operandi*, which, after some experience in the process of inoculation, was found to be the most effective and convenient. Before doing this, however, I shall mention that after the destruction of so large a portion of my herd, I purchased for the partial re-stocking of my run five hundred store cattle from a herd which was said to have been exempted from the disease, and which had not been inoculated. These cattle had not been six weeks upon my run when pleuro-pneumonia broke out among them with some virulence. The whole were immediately inoculated, and the disease suppressed, the loss not exceeding four per cent. One word more, and I shall have done with this part of my subject—the evidences of efficacy of inoculation. Last year pleuro-pneumonia again visited the Clarence district, and appeared in my herd. I immediately had recourse to inoculation, beginning with my imported and other more valuable

animals. Of the former I lost none, and among the latter the loss was quite nominal, not reaching one per cent. It may now be well shortly to describe the mode of procedure which experience taught us to adopt as combining a sufficient degree of efficacy with the smallest degree of injury and danger to the animals operated upon. The inoculating knife we consider to be much preferable to the needle, mainly because the former can be so much more rapidly applied as to render unnecessary the confinement and crowding of the animals under operation to at all the same extent as when the latter is used. In using the needles, the tail of the animal must be retained for some moments in the hand of the operator, this rendering necessary the crowding and confining the cattle in narrow enclosures appropriately called crush pens, causing injury more or less serious, especially to the weaker animals; whereas when the knife is used the operation is accomplished, in an instant, and before the animal has taken alarm at the manipulation of its tail. Thus close crowding is rendered unnecessary, and a yard of five panels by four is found most suitable and convenient. Into such a yard fifty to sixty grown cattle, or double the number of weaners, are admitted at one time, and the operator enters and works inside, not from the outside of the yard. In this manner a single operator, attended by a boy to hold the cup of virus, and a man to bang tails, may with ease inoculate five hundred cattle in the day, and without subjecting the animals to any rough or injurious treatment. I admit that with wild, rough, ill-managed herds, the mode of procedure above described might be found difficult, that with such the operator might naturally prefer the outside to the inside of the fence, thus rendering necessary a much narrower enclosure and a greater degree of crowding, but of such herds I have had but little experience. It now only remains to speak of the proper selection of the lymph or virus to be used, which though here coming last, is by no means the least important matter for consideration. It is not, I think, generally understood that the liquid which (as all who have any acquaintance with pleuro-pneumonia will know), is so frequently found secreted in large quantity within the cavity of the chest of infected animals, is the best and safest description of virus to use for the purpose of inoculation. By the use of this liquid, instead of that obtained from the diseased lung, the risk of loss from swelled tail is almost entirely avoided. In fact, the dangers attendant upon inoculation are to a very large extent escaped, while the beneficial influence of the operation is in no degree impaired. Of this so little doubt is entertained in the Clarence district that the use of virus taken from the lung was very early, and, I believe I am justified in saying, very generally abandoned. In obtaining the liquid spoken of, care has always been taken to procure it in a bright and pellucid condition, but I am not prepared to say that such precaution is really necessary. In the virus obtained from the lung, pellucidity and a pale colour were so generally acknowledged to be indispensable conditions, that it was taken for granted that similar conditions must also be requisite in this new kind of virus or lymph when it was adopted, and, as far as I am aware, no one has hitherto in using this lymph thought it expedient to venture to dispense with these conditions. This description of lymph moreover is readily obtained in the required condition, much more so than the lung virus; I have usually been enabled to obtain it from the first or second animal killed for the purpose, and have never found it necessary to go beyond a third. In short, I think this to be so much preferred to the lung virus, that I cannot too strongly recommend its use. In conclusion, I have only to add that should a perusal of the foregoing contribute to induce those among your readers who are engaged in the breeding of cattle to adopt a practice, to arrive at a knowledge of the great value of which cost me so dearly, I shall not regard as mis-spent the few hours which have been devoted to the penning of this record of my experiences.—*E. D. Ojilvie in the Riverine Grazier.*

A DELUSION AND A SNARE.—Chambers of Agriculture as generally constituted are a delusion and a snare to tenant farmers, and so far from their being a means of securing their just rights and legitimate influence, they are practically the reverse. Joseph Arch, in his speech already named, perceived this clearly, and thus expressed his thoughts on the matter:—"They are not worth a straw to them, for if tenant farmers are to do any justice to themselves in their Chamber,

they must have men of their own class in office, and until they have they may 'Chamber of Agriculture' to the day of resurrection, but they will never make any progress." The reason is, the Chambers have been, and are, overshadowed, and their freedom crushed by the influence of the landlords, so that they have been of no essential advantage to farmers; and they have failed to gain the appreciation of shrewdly practical agriculturists who do not attend them, but look blank or shrug their shoulders when they are mentioned. The paucity of attendance seems to be the most remarkable feature about

them, judging others by those in this district; but with one landlord chairman, another vice-ditto, and a laud steward as secretary, there is no wonder that the farmers attending their meetings may be counted on one's fingers, though the surrounding conditions ought to send them nearly as many hundreds. They would do so if they were really and truly independently farmers' Chambers of Agriculture and politically educational, as they ought to be if farmers mean to achieve through them their just rights and their legitimate status in the commonwealth.—*Mr. James Hutchings, of Banbury, in The Organ.*

SHEEP IN AUSTRALIA.

The conditions under which sheep farming in Australia is carried on being very similar to those existing in our Western pastoral regions, it is very interesting for us to learn something of sheep management in that country. This we may gather from a very interesting little work recently published in Melbourne, Australia, entitled "A Treatise upon the Australian Merino," by J. B. Graham, who has been a shepherd all his life, having been born upon a sheep-run, and is now superintendent of a very extensive "station" or sheep-run in that part of the world. From that work we gather the following useful facts: "The building up of a race of sheep is the work of many years. Twenty-three years' were spent by the most successful sheep breeders in building up the pure breed of Australian merinos. Climate is of secondary importance; it is blood which produces the desired effect. Hot climates can be used to produce as good a wool as any, but the breeder must not aim at large sheep. A sheep 'short on the pins with bodies close to the ground' is the one for hot countries. The moment the breeder aims at size he goes wrong. Feed will make mutton sheep out of any race. The merino, by proper alimentation, can be made equal to the Southdown as a mutton sheep. In breeding for size, the sheep must be born fat, and must not know a check from that period to the moment they are sold or slaughtered. Pastures for such sheep should be kept understocked. Crossing of races, especially with the English sheep, is ruinous. Size is destructive of quality of wool, and merinos crossed with longwools produce sheep whose fleece becomes harsh and loose, and whose belly and joints become bare and naked. An acclimatised native sheep is better than any foreign one, unless it be the American merino, which, in Australia, is the best of all imported breeds. The best effects are produced by in-and-in breeding, with careful and judicious selection; and the more skillful the selection made the sooner a perfect flock, able to transmit perfectly its qualities, may be built up. If a ram possesses the requisite qualities he should be used even with his own dam. By this course the quality of sire and dam are both improved upon, and perfection is soon reached. The closer bred, the more even and regular a flock becomes and the more certainly the characteristics desired can be reproduced. By the opposite course a flock has been so run down that 207 fleeces weighed only 205 pounds. Fresh rams had been purchased each year for this flock, and rams had been exchanged with neighbours for the express purpose of avoiding close breeding. There had been no selection as to the needed qualities, and the flock was ruined. No improvement can be made without dividing the flocks and keeping only the best for breeding. A large flock should be divided into three; the best for breeders, second-best to replenish the first with selected lambs, and a third kept for sale or slaughter only. Foreign blood may bring in some desired improvement, but generally with a whole colony of defects, and the greatest circumspection should be used in bringing in such blood. Overstocking a pasture diminishes size and brings on premature old age in a flock, for the short bite compels the sheep to take up grass roots, along with the soil adhering, by which their teeth are ground away, and in four or five years the teeth are often worn to the gums. The wool is also deteriorated in quality. When feed falls off and partial starvation occurs, a break or tenderness in the wool marks that exact period of its growth, and its market value is reduced as well as the weight of the fleece. Besides, in all pastures there are plants and herbs either noxious to sheep or which they dislike. In a bare pasture these are left closely denuded of all shade from other plants and grow and thrive out of all proportion, in time crowding the proper herbage and taking sole possession of the ground. They also seed freely, while the better herbage has

no chance to seed, and very soon the pasture becomes run out. In culling flocks, the following should be rejected—*viz.*, short-stapled and hard-wooled sheep; sheep that strip at the points, have no top-knot, and lose the belly wool; those that have black, brown, or yellow spots on the legs or face; very small sheep, and those that are thin and feeble; those which have thin and light wool, or which have white hair upon the face, under the arm, or inside the thigh; those with very coarse wool upon the breech, or having long hairs upon the surface of the fleece; those having wool less than one inch in length on the ribs or withers; long-legged, small-bodied sheep, or those dipped in the back or misshapen in any way. The fleece of a perfectly-wooled merino sheep should not open in layers, but should remain closed at a distance of three to four inches from the point touched, and 'every fibre of a good fleece should grow independently of any other, just like hairs in a broom.' The neck of the merino ram should be short and thick, free from straight hairs on the under part, and without dewlap; the horns should be spiral, and not too close to the head. The shortness and regularity of the curve of the horn and that of the wool will be found proportionate. On the forehead should be a good top-knot coming down to the eyes, the face small, free from wool, and covered with fine down. The eye should be quiet, mild, and full. The body should be round, straight, but not too long upon the back, and wide across the shoulders and loins. The legs should be short and well placed. Upon the shoulder the wool should be three to four inches long, and elsewhere as near to this standard as possible both in length and fineness. The fleece should be smooth and level over the entire surface, thick, soft to the touch, with abundance of gold, and when handled should fill the hand. The chief defects of a merino fleece are (1) 'watery wool,' which renders it fit for the manufacture of inferior goods only. This defect consists in an absence of the natural curves and an appearance as if the wool had been crimped, a want of elasticity when the wool is squeezed, and deadness of handling, similar to that of flax; it is found below the shoulder precisely where the best wool should be. This defect is markedly perpetuated by breeding from rams thus defective. (2) Toppiness, which consists of a pointed appearance of the fleece, from the fibres being of uneven length, when the wool curls at the end and forms 'noils'; these are dead wool, and break off in carding, and cause a loss which reduces the value. (3) Broad-topped wool, or that which, while seeming to the inexperienced eye to be even and well grown, is interlaced and almost felted together, the top of the fleece clings together and breaks when separated, the wool, being split from the top downward for half an inch, and dead and without strength, breaks with a slight strain, and causes loss and annoyance. (4) Felty and cloumy wool, or what is known as 'coty' wool, originally owing to starvation or unfavourable weather. This is also a property transmitted by descent, and sheep owning such a fault should not be bred from. This fault consists in a flossy appearance of the staple, which causes the wool to mat, and when carded or combed there is a great consequent waste. (5) Mesly wool, or that which is light, weak, unsound, and without body, and is consequent upon neglect. Locky wool, or that which opens or breaks into separate locks, and is generally seen upon the shoulder and ribs. Kempy wool is that which is mixed with coarse white hairs, and appears generally upon the face, forearm, and inside the flank more conspicuously, but its appearance there unfortunately is a proof that the greater part of the fleece is adulterated with it. These hairs do not take the dye, and the consequent loss of value in the fleece is easily

perceived This amounts to 50 per cent. (6) Tender or brachy wool, which is absolutely unfit for manufacturing. This defect depends solely upon bad management, and results from poor care or scarcity of feed or water. When low condition from want of nutrition occurs, the growth of wool is contracted and the fibres become attenuated or very fine. When the cause is removed, the growth is stronger and the fibres become of their normal character. The wool is then weak in the middle of the fibre, and snaps apart upon a strain at that part which grew while the sheep were in poor condition. "There is nothing which more effectually causes "break in wool" than the want of water." Most of these defects being fixed constitutionally upon the animals and descending to their progeny, it is of the utmost importance to select breeding stock free from them." From these foregoing facts we should gather that it is of the greatest importance for our shepherds to give proper attention to the improvement of their flocks from within, or at least from selections made in their own locality; thus building up a class of sheep suitable for the peculiarities of soil and other conditions to which they are subject, rather than by ill-selected or promiscuous foreign importations.—*New York Tribune.*

EMIGRATION IN 1873.

The emigration of 1873, which amounted to 310,612 persons, was greater than that of any previous year since 1854, when the so-called "Irish Exodus," which began in 1847, may be deemed to have terminated. The number of emigrants embarked last year from each of the three divisions of the United Kingdom was—

From England	232,885
" Scotland	24,526
" Ireland	53,201

The destination and nationalities of the emigrants are shown in the following short abstract :

Destination.	Nationalities.					Total.
	English.	Scotch.	Irish.	Foreigners.	Not distinguished.	
The United States.	78,968	12,226	75,536	61,320	5,023	233,073
British N. America	19,438	5,423	4,184	7,687	476	37,208
Australasia.....	18,814	2,552	3,471	1,029	262	26,428
All other Places....	6,123	809	501	2,162	4,308	13,903
Total.....	123,343	21,310	83,692	72,195	10,069	310,612
In 1872 the totals were.....	118,190	19,541	72,763	79,023	5,696	295,213

There was an increase, therefore, as compared with 1872, of—

English	5,153
Scotch	1,769
Irish	10,929

and a decrease of foreigners of 6,825.

The per-centage of emigrants of each nationality was in 1873—

English	39.70
Scotch	6.84
Irish	26.94
Foreigners	23.24
Not distinguished	3.24

The total emigration for the year exceeded that of 1872 by 15,399 persons. The excess was divided chiefly between the colonies in British North America and those in Australasia. About 5,000 more persons than in the previous year having gone to the North American colonies, and about 10,500 more to the Australian colonies. The large increase in the emigration to Australasia is no doubt attributable to the re-opening of assisted emigration.—*From the Official Tables.*

TENANT-RIGHT AND LABOUR-RIGHT.

TO THE EDITOR OF THE MARK LANE EXPRESS.

SIR,—It would appear from your leading article on the discussion on Tenants' Compensations in the Notts Chamber of Agriculture that I was in fear of a *permissive* bill. It appears to me that a permissive bill is simply ridiculous. Some landlords join their tenants in asking for a Tenant-Right Bill for their *mutual benefit*. Why do they not also ask for a bill to enable the tenants to raise their labourers a shilling or two a-week? In my humble judgment that would benefit *everybody*.

We have had two sets of discussions this year—Tenants' Compensation and the Labourers' Unions. We are told by the very same class of persons that as the demand for farms is greater than the supply, the tenant-farmers, however rich and intelligent they may be, must be *protected*, inasmuch as they are not in a position to make just and proper agreements for their farms. On the other hand, when the supply of labourers is greater than the demand, the flag of *political economy* is hoisted at once, and the poor half-starved men are told they must exist on bread and tea, or migrate, or emigrate, in obedience to a *great law*, which is not to be broken. As a sincere democrat, I ask Why are a class with, it is said, 800 millions of capital to be *protected*, when a far larger class, who have nothing but their labour, are *not to be protected at all?*

Yours,
CHRISTOPHER NEVILLE.

Thorney, Oct. 22.

THE FARMER'S INTEREST IN "RE-ADJUSTMENT."

TO THE EDITOR OF THE MARK LANE EXPRESS.

SIR,—In your last issue there was a report of the Devon and Cornwall Chamber of Agriculture, at which an estimate was given of £800,000,000, as the capital employed in farming in England.

It may be useful to remind the agriculturist that if the movement for assessing personal property to the poor were carried out, this would have to be assessed, and tenant-farmers have to contribute on their respective stocks. As a rule, farmers have lately been less anxious to reduce the rates than some few years ago was their desire, no doubt being of opinion that Mr. George Andrews, in his evidence before a Select Committee of the House of Commons, was quite correct in stating substantially that if £90 rates were taken off, £90 rent would be put on; in short, that so much less rates meant so much more rent.

Now what would be the annual assessment of the 800 millions of farming stock?

The special reporter of *The Times*, in an article headed "Farming in Suffolk" which appeared in that journal of 26th September last, giving some practical details, showed rather over 10 per cent. as the average profit of occupation of 200 acres, of which the rent was £335 for the ten years 1862 to 1871, on a capital of £2,500; the recent increased price of labour for the last year had been £102, thereby reducing the tenant-farmer's profit from £250 (round figures) to £150, or from 10 to 6 per cent.

If this be a fair representative case, and *The Times* correspondent says "I have every reason to trust the good faith of the farmer in this instance," the assessment would have stood on the 800 millions at 80 millions, the increased price of labour rendering an appeal of over-assessment to be reduced to 48 millions annually; perhaps, however, it may be safe to take a medium, and fix 8 per cent. as a reasonable rate of profit, making 64 millions as the annual value at which the estimated 800 millions of

farming stock should be assessed. £140,000,000 was the estimated annual value of the land, therefore farming stock would have to contribute nearly one-half the proportion charged on the land. How any other person than the landlord could derive advantage from such readjustment of taxation is beyond my power to understand.

Then, on the subject of what may shortly be called succession duties, so ably noted in your leading article of 12th Oct., it seems that when a tenant-farmer pays £1 the landlord only pays 2s. 6d.!

Can any sane man justify this anomaly? Still, not one word is spoken at agricultural dinners on the subject, notwithstanding the great interest which country gentlemen appear to take in behalf of tenant-farmers. Is a taxation of £80 on farming stock, when the landlord is taxed £10 only on the land, a reasonable inducement for the application of more capital by tenant-farmers?

Where is the man who will in common justice bring this subject before the House of Commons? Once mentioned the present inequality could not stand the pressure of public opinion beyond the existing Parliament.

Oct. 22. Your obedient servant, COMMON SENSE.

A MILD AUTUMN.—A mild autumn is the rule rather than the exception in this country. Britishers who have by travel become familiarised with the climate of the prairie region of the United States designate such weather as we are now enjoying the "Indian summer," because of its likeness to the pleasant autumnal weather of the States, which colours the woods as they are coloured here, but with more fire and greater variety. The gigantic gooseberry and prodigious potato that help the newspaper reader to roll easily out of political excitement into bucolic rest will now be superseded by a second crop of apple-blossom, an unwonted late production of ripe strawberries, and a second golden-green growth of the forest trees, which have been long starved by drought, and are now considerably excited by a welcome fall of rain and a renewal of the summer sunshine. We have had two small frosts in the neighbourhood of London—one of about three degrees on the 8th, and one of about five degrees on the 20th. But vegetation is as yet scarcely affected, and in our own garden, on the cold clay of the great bottom that connects the valley of the Lea with the east of Muswell Hill, geraniums out of doors are now flowering freely, *Berberis Darwinii* is richly adorned with racemes of its peculiar apricot-tinted flowers kidney beans are producing plentifully, balsams are buxom green hushes showing still a few of their handsome flowers, and several plants of the dianthus and primula families are in flower. As the gardener fears a forward spring as the precursor of a poor summer, so he cannot but regard the present enjoyable weather as dangerous to vegetation, for it promotes activity in plants that should be going to rest, and renders them the more liable to suffer should intense cold suddenly supervene. It is not much we can do to avert possible loss in the event of winter coming early upon us, and finding vegetation soft and sappy and unprepared for frost. As regards probabilities, they are in favour of another mild winter, but, as we know nothing of the future, it is well to be always prepared for the worst. Now, as regards every tree and shrub that is to be bought and planted, or simply moved from one part of the garden to another, the prudent cultivator will take advantage of the dryness of the ground, and the other agreeable conditions that prevail for outdoor work, to make an end of all planting and transplanting as soon as possible. Every tree and shrub lifted now, even if full of green leaves and actually making new shoots, will go through a hard winter better than those of its own kind in the same climate that have not been disturbed. We have many times saved fine specimen plants of questionable hardiness by simply lifting them carefully, and planting them again on the very same sites. The tender tea roses are especially benefited by this procedure. The lifting stops the growing, and operates in some degree as an artificial winter. The gardener may now with advantage look around to discover for himself the subjects that it may be advisable to subject to the process. Trees that are known to be hardy and that are doing well should of course be left alone, for these remarks apply only to subjects that usually suffer when they

grow too late and are frozen too soon. As for greenhouse plants of all kinds, the sunshine is good for them, and if they have plenty of air, and the smallest possible supplies of water, they will go to rest quietly. On the other hand, many things that are to be forced will require to be made to feel that winter has actually come upon them, and this to some extent may be managed. Stools of rhubarb, sea-kale, and suchlike that are to be forced should be lifted and left out to be just touched by frost. A thin coat of leaves should be put over them to prevent injurious desiccation, but they should come out of the warm ground into the cool night air to experience the rigours of a make-believe winter, before being tucked in comfortably in the forcing-house. It may not occur to the mind of the Church to pray for rain just now, but, as a matter of fact, we want a steady downpour, day and night, for a whole week at least. On our strong clay in the marshy bottom on the western side of the Seven Sisters Road, the ground is fairly moist for a depth of two inches only; below that depth for five feet at least it is as dry as dust, and we are actually compelled to keep the water-cart going as a necessary implement in the business of planting, which is unusual at this season of the year. We may reasonably expect rain in plenty shortly, and it may be some comfort now to bear in mind that we are always more sure of the winter than of the summer.—*The Gardener's Magazine*.

A HIGH HARVEST FESTIVAL.—The festival of St. Luke was selected by the Rev. W. J. Richardson, of St. Thomas's, Regent-street, as the day for Harvest Thanksgiving; and very tastefully indeed, though not profusely, was the ugly old chapel decorated with fruits and flowers. The altar was crowded with candles—I will not commit myself even to a guess at their number—and bright with flowers. The choristers' stalls were hung with bunches of grapes that must have made the little boys' mouths water; and the font and pulpit were also gay with autumn garlands and ears of corn. Banners were stationed by the vestry door as I entered, and young men clad in cassocks, with the badges of their guilds hanging from their necks, were busily marshalling the vast congregation to their places. "Matins" were commenced in a lugubriously low pitch at eleven; but Tallis' festival responses with accompaniment soon raised this. Special psalms were chanted to different tunes by the soprano and adults of the choir antiphonically; and Dr. Stainer's harmonised Gregorian *Te Deum* was remarkable, as showing how much might be made by a little ornamentation of that antiquated and generally rather distressing kind of music. After the sermon, which was not appropriate, came the offertory, collected while the choir sang the fine harvest hymn, "We plough the fields and scatter the good seed on the land;" and then the officiating minister, standing in the "eastward position" at the altar, concluded matters with the General Thanksgiving, Prayer of St. Chrysostom, and Benediction. At 12.15 ten tapers were lighted on the altar, and the choir, which had left the chancel, entered in procession, with two banners, and a handsome new cross of silver gilt, glittering with gems, the choristers carrying bouquets, and singing, "Come, ye faithful people, come; raise the song of Harvest Home!" Then commenced the "High Celebration." This, it need scarcely be said, was choral throughout; even the Epistle and Gospel being intoned. The Kyrie, Credo, and Gloria were by Dykes; and the beautiful hymn "Jerusalem, my happy home," was selected for the offertory. The "Comfortable Words" and "Sursum Corda" was sung to a complicated melody by the officiating minister, very much after the manner of the reader in a synagogue service. The "Sanctus" was a beautiful one; and before the Consecration Prayer was sung a soprano solo and chorus. Verily, the Public Worship Regulation Bill will make a revolution in St. Thomas' next summer! The celebrant stood full in front of the altar with uplifted hands during the former portion of the prayer, and afterwards elevating the elements. The congregation prostrated themselves during the consecration; but few communicated, for was it not a "High" celebration? Several sacramental hymns succeeded, including Gounod's "Benedictus" and "Agnus Dei," and the whole closed with a recessional hymn. In the meantime, we poor outsiders looked down from the gallery, feeling how far we had been left behind by the advancing tide of Ritualism, and wondering what our old-fashioned country cousins would have thought could they by any possibility have anticipated such a High Harvest Festival as that exceedingly beautiful one we had just witnessed!—*The Daily News*.

"DRY" HUMOUR.—The House had not merely no Bernal Osborne, but it was fairly at a loss to discover any one on whom a shred of Mr. Bernal Osborne's mantle might have fallen. Some expectation was aroused by the return of Mr. Patrick Boyle Smollett for Cambridge. Mr. Smollett had long since acquainted the world with the fact that he was not destitute of a certain power of manufacturing coarse jocosities. In a past session he had styled the late Mr. Maguire "a talking potato." The phrase was a plagiarism, but it was felicitous. Unhappily Mr. Smollett had no sooner made his attack on Mr. Gladstone than honourable members perceived that his faculty of amusing them had gone, and that only the dregs of scurrility were left behind. At this dispiriting conjuncture of affairs Sir Wilfrid Lawson asserted his presence in the House as the good genius of the hour. Anything more dreary than the debates on the Licensing Bill was never heard in St. Stephen's itself. But Sir Wilfrid Lawson extracted merriment from the theme, cracked his jokes, and kept his audience in a tremor of suppressed laughter. He did not gush sentimentally like Mr. Beresford Hope, nor essay a humour so broad as that attempted by the colossal Mr. O'Gorman. He adapted his tone to his listeners, and it must be confessed that, high or low in itself, it was singularly level with the intelligence and appreciation of a large majority of the House of Commons. It was a positive relief after the interchange of trite controversial trivialities between the gentlemen on the right and left hand of the Speaker, after the prozers had done with their platitudes, and the bores had rested from their questions; after Mr. Goschen in a fit of simulated indignation had twitted the Government first with canting, then with recanting, and next with recanting their recantation; after Mr. Cross had feebly vindicated, in that peculiarly thin and mean voice with which the Home Secretary is blessed, what by a conventional euphemism he was pleased to call the "principle" of the bill—it was a positive relief when Sir Wilfrid Lawson rose. There is no surer test of the repute in which a speaker is held than the appearance presented by the House on his starting to his legs. If the benches are thin and grow thinner, or if from being densely packed they swiftly show a series of vacancies, you may be sure that the tongue of a bore of the first magnitude is about to wag. What happened when Sir Wilfrid Lawson emerged from his place just behind Mr. Walter was the converse of this. The attendance in the House was certain to be thin; it is computed that no honourable gentleman, save the occupants of the Ministerial bench, ever endured more than half an hour of the Licensing Bill continually; but the intelligence that the member for Carlisle was riding his favourite hobby was sufficient to rekindle the expiring ashes of interest, and to replenish a whole row of empty places. The bores and prozers hate Sir Wilfrid. His flippancy, they solemnly inform you, covers his cause with ridicule, himself with contempt, and is a direct insult to the House. It must be admitted that Sir Wilfrid Lawson is flippant. Cold water, as he himself admits, is not a cheery theme; but it is his mission to show that with a due measure of facetious treatment it may become as amusing as any other which engages the attention of the Imperial Parliament. If Sir Wilfrid had assumed the heavily tragic rôle of Mr. J. B. Gough, and had composed rhapsodies on mountain streamlets and flashing rivers, the House would have declined to hear him. But he has no ambition to be the Demosthenes of teetotalism; he is quite content to discharge the more humble, more entertaining, and not less useful functions of his Hierocles. The topic which engaged Sir Wilfrid Lawson's energies last session in the House was somewhat musty. Quite enough of "Beer and Bible" had been heard in the course of the last general election, and in the comments of politicians and journalists which had succeeded it. Sir Wilfrid Lawson really contrived to impart freshness to the matter. His criticism was superficial, but it was often apposite. He has the faculty, exceedingly rare in the present Parliament, of gauging precisely the temper of the House at any given moment; and the consequence was, that his remarks seldom failed to hit between the wind and water. And in a degree inferior to Mr. Disraeli, Sir Wilfrid Lawson is not destitute of something of Mr. Disraeli's power of inventing phrases that stick. They have not the subtle aroma which makes the word-combinations of the Premier such intellectual treats. But they serve their turn; and when he said the other day at Manchester that "populous places" under the new Licensing Act were dependent, not on the density of the population, but the density of the magistrates, he achieved

a very respectable epigram. But it is when Sir Wilfrid Lawson has his own particular project in hand—the prohibitory Permissive Bill—that he is seen and heard at his best. To defend a paradox was an ancient academic exercise for stimulating the intellectual powers; and Sir Wilfrid Lawson gathers the very inspiration of well-bred buffoonery when retailing his humorous arguments in favour of the proposition, that because some persons drink to excess, therefore it is right to allow no one to drink at all.—*The World*.

A LANDLORD'S LECTURE.

At a show on the Ormsby Gore estate, Ireland, Major ORMSBY GORE said: There are several matters connected with this show which have come to my ears that I cannot pass over without expressing a candid and clear opinion upon. In the first place, I have to congratulate you all on the bountiful returns of the harvest, and upon the general prosperity which appears in the country. With the exception of the price of store cattle, in every department of farming there are good prices, and returns are bountiful. The condition of the cattle in the show-field to-day was not so good as on former occasions. I do not attribute this to any fault of the farmers for not having them in better condition. It was mainly owing to the season. Then, with regard to the number of entries, I have gone through the list with Mr. Layng, the secretary, and I find that in the first class this year there were seventy-eight specimens exhibited, compared with sixty-eight of last year. In the second class there were fifty-four, compared with forty-five of last year. These are gratifying features of this year's show so far; but in the third class, which is a very important class, there is this year a great falling off. There were forty-six specimens exhibited in this class last year, but to-day there were only twenty-five. The total number of entries have been 203, compared with 138 of last year, showing, on the whole, an increase of 15. That is a satisfactory, though not a large difference. I must also say that in the horse department there was a marked improvement on former years. In pigs and sheep there was a falling off. I now come to a more unpleasant subject, and that is that I have heard of more than one instance where the third rule of the Society has not been adhered to, but on the contrary, where it has been disgracefully infringed upon. The third rule is a very simple one, and easily understood. It runs as follows: "Every specimen exhibited must be the property of the exhibitor for at least three months previous to the exhibition." On a former occasion I had reason to remark upon an infringement of this rule, and I then told you all that if such things went on I would break up the Society; for it is a scandalous thing that any tenant should be so degraded to as swindle his neighbour—for I can call it nothing else but swindling—out of what should fairly come to that neighbour—what he earned by exhibiting an animal which was not his own. There is also another unpleasant matter I must refer to, and that is that the very small subscriptions which you are asked to pay are in many cases grudgingly given, and sometimes not paid at all. That is not a fair thing to do to the Society. My own subscription to the Society is seven or ten times more than the subscriptions of the tenants put all together. If you do not pay in the few shillings you are asked to give, how can it be expected that I can consider you take any interest in the Society at all? It is not a creditable thing that you should neglect these matters. Indeed, seeing such a state of things and finding that the supporters are nearly all confined to the parish of Achoury, I have been recommended to break up the Society (several voices: "Do not, your honour"). Well, I will not do so at present. I will give you one more chance; but assuredly, if I have grounds for making the same complaints, I will break up the Society, and I will consider in what other way a similar expenditure on my part would be best laid out for the advantage of my tenants. It is only for their advantage that I do subscribe to the Society as it exists; and if the tenants are so dead to their own interests as not to think it worth their while to support it, I must only find out some other means whereby I can benefit them. It is not for the sake of putting money in my own pocket I have kept up the Society so long; it is to benefit you; and so long as you give it a fair and proper support, I will support it too. You cannot expect me to do so when you infringe a plain rule which can be easily observed. No doubt the Society in past times

did much good; but I am beginning to think that those days are past, and that the benefits are not extending so rapidly as in former years. There is one thing apparent—that, since the formation of the Society, there has been a marked improvement in the making of butter. When we first established this Society, 27 years ago, the butter of this locality was very inferior; now it is very good. The consequence is, the tenants

have derived a considerable amount of profit by the improvement. Major Gore then referred to the benefits which would accrue to the farmers of the county if they could put their hay into wooden hay barns, such as he saw in the Abbeyview farm-yard, and he recommended some improvement in the formation of such.

T E N A N T - R I G H T.

At the quarterly meeting of the Notts. Chamber of Agriculture, held at Reiford, Mr. Foljambe, M.P., in the chair, Mr. GODBER read the following paper:

I believe it was proposed by the Council in the first instance that the discussion to-day should be based upon the report of a committee appointed by the Central Chamber to consider this question in all its bearings, copies of which it was then expected would be forthcoming sufficiently early to aid us in our discussion to-day. At a subsequent meeting of the Council it was ascertained that the report would not be available in time. I was then requested to open the discussion here in what the Council please to call my own way. I much regret the circumstance that the schedules containing the customs collected over the whole country bearing on this subject with the report I have referred to have not been forthcoming, there being no doubt of their greatly facilitating our discussion on the subject. You are all aware that the subject for discussion is by no means a new one; it has been discussed by this Chamber at Worksop, where it was introduced by Mr. Huskinson, it has also been discussed at a meeting of the Chamber held at Newark, 18 months ago, when an important paper was read by Mr. Nevile, and I believe all the provincial chambers have given to it a like prominence; it has also been a standing dish with the Central Chamber, and further it has on one occasion put in an appearance in the House of Commons, from whence it disappeared through the forced absence of one of its sponsors and the timidity of the other. We therefore take it for granted that whenever and wherever it is now publicly discussed, it is with a view to legislation. The first question naturally arising, is what change has come over the agricultural world or the community at large, to render legislation on this subject desirable for a proper solution of this question, it is not necessary to go back to a very remote period in the history of our country. We have no need to go beyond the limits of the present century to find agriculture in a rude and undeveloped state. The same would also apply to our mining, manufacturing, shipping, commercial, and other interests—interests which have in our day attained to such gigantic dimensions. At the period referred to the habits of the people were plain and simple, and their wants were few. Rents were but a trifle, implements of husbandry were rude and uncouth. Chemical and engineering science were but in their bud. The wants and requirements of particular plants were little understood; nitrates, phosphates, muriates, ammonias, &c., were things unheard of; yea, a great portion of the land in this country, our fens, forest, and heath lands, were thought to be of little worth, but the commercial spirit, the growth of the last fifty years, with the great increase in our population, has changed the whole aspect of affairs. Land is now dealt in on commercial principles, and is annually becoming of more value and importance. Not only have we a population trebled in numbers, but their habits, tastes, and means have undergone an inconceivable change. Under such circumstances a more perfect development of the capabilities of the soil is a question not merely affecting the parties directly concerned, but one indirectly affecting the whole community. Men of noble birth and high position, and men, too, of low estate, have proclaimed to the world that the land does not produce half what it is capable of producing; but all men of a practical character, men who have had no little experience of the vicissitudes of seasons, will look upon these assertions as bordering upon the extravagant. You may treat your land most liberally, and raise it to the highest degree of fertility, but you have neither the keys of the clouds nor the command of the sun, and when looking for the return you feel entitled to expect your crops may be either stunted by drought or ruined by excess of moisture. No

doubt a great deal of land is capable of producing much more under more liberal treatment, but the first thing necessary to accomplish this is the application of capital. The amount already employed in conducting the operations of agriculture is not millions merely, but hundreds of millions, and it is notorious that in no other occupation or pursuit in this country is there so much capital employed where the profits are so small and the security so inadequate and undefined. In this respect, with all our vaunted progress, we have not got beyond a few crude, irregular, and, some of them, ridiculous customs, varying in almost every county. Hitherto, the best guarantee the tenant has had for the investment of his capital in agriculture has been the good name and high character of the landlord. But it not unfrequently happens that another Pharaoh comes upon the scene, who has no knowledge of Joseph. Estates are brought into the market, and pass into the hands of speculators, manufacturers, or wealthy merchants, who bow to nothing but the golden image, and listen to no doctrine but the one of pounds, shillings, and pence. Reviewing the circumstances interwoven with the whole question, it must be conceded that the demand for a uniform, definite, and more substantial guarantee for the investment of capital in improving the land, increasing its fertility, and augmenting the supply of food, is a just and reasonable one, and one that must commend itself to the consideration of the Legislature. The details of this subject will form matter for much discussion, and will lead to the expression of a variety of opinions. What is wanted is simply that the line should be drawn fairly between the parties concerned. I think the opinion is pretty general that all really permanent improvements properly belong to the landlord. Under this head we may name the thorough drainage of clay land, the making of all permanent roads necessary for conducting the operations of the farm, the planting and fencing of quicks for making proper enclosures, the erection of suitable farm buildings and cottages, providing for a proper and permanent water supply, reclaiming waste lands, &c. Many different methods have been pursued with respect to draining. On many of our largest estates the whole has been carried out by the landlord under proper supervision, interest being charged for the cost of labour only. This is no doubt, the most commendable system; others have had recourse to the loan system, the repayment of which is extended over some 20 years, at the rate of six or seven per cent. This charge is commonly placed upon the tenant, making an addition to his rent. In such case the improvement is really effected by the tenant. There are, too, many instances in which the landlord has found the material, the tenant finding labour. Much of the work done upon this principle has not been well and efficiently done. There are also many instances where the whole cost has been borne by the tenant. In these cases an allowance is made on quitting, extending over a limited period, generally from three to seven years, a period much too short. But there are many lands that yet require draining, the landlord being unwilling or unable, and the tenant not liking to embark in the undertaking, the conditions as to compensation not being satisfactory and encouraging. I can only compare this drainage business to the education question at the time the Legislature took it up. A great deal has been done during the past 50 years by a variety of parties upon many different principles. Much has been done imperfectly, and requires to be done over again. I have dwelt at some length upon this question of drainage because it is really the first and most important step in improving our clay lands, and specially so when viewed in connection with the revolution that has taken place in the mode of cultivation. The old high-backed ridges and deep furrows will not do for the steam cultivator, reaping machine, and modern horse hoe. There are no doubt many

improvements of importance peculiar to certain localities, with which we are not familiar, which may be placed in the same category, being of a permanent character, and therefore properly belonging to the owner. We will now pass on to notice very briefly such improvements as come within the province of the tenant, though of an exhaustible character, necessitate a large outlay. To raise a naturally poor or an exhausted soil to a good and fair state of fertility is not the work of twelve months but a work of years. Mr. Mechi is, I believe, a good authority on such a question; to do this under a system of short tenure, or in the absence of proper guarantees for compensation on quitting, ought not to be expected. Cleansing, ploughing, chalking, liming, manuring, boning, &c., added to which a large outlay on food is necessary, especially on all light lands, as cake, corn, &c. The increasing demand for meat brought about by the increased means and altered habits of the people, has rendered it desirable that much more should be done in this direction. While upon this point I should like to call your attention to what has long appeared to me a great anomaly in the existing customs. We are foolish enough to give a premium in favour of foreign produce, a liberal allowance being given where cakes are used, the poorer sorts of which often contain a large proportion of chaff from our own grain. All this sort of thing is allowed for; but when our own pure grain is used, as beans, oats, or wheat (which at its present price is cheaper than anything), no allowance is made. Surely this requires to be remedied. It is said that in Lincolnshire and Notts. we have the best customs in the country, but they differ widely. In Notts. where the turnip crop is consumed on the land, the rent and rates are allowed, but in Lincolnshire no such allowance is made, and I am informed that in parts of the neighbouring county of York half orders are allowed, even after the succeeding barley crop is taken; such is the great want of uniformity that no two counties are alike. We now come to the most delicate and intricate part of the subject; what form do we desire to see legislation take upon this question? Shall it be permissive, or of general application. We will not have the word compulsion, it always seems to carry with it so much alarm to the mind of an Englishman. To have a measure merely permissive would, to my mind, be making confusion worse confounded. I would prefer it should be of general application, making an exception only in favour of leases from seven years and upwards. Upon this part of the subject we have some little data upon which to go. Having watched the discussions of the Central Chamber, I think they propose to make it permissive, rejecting the twelfth clause in the late Bill; it would then be open for any one to say I will have nothing to do with that abominable Compensation Act, I will make my own conditions, and from that court you know there could be appeal. No law is wanted to compel liberal and enterprising landlords to effect improvements, or to get them to allow their tenants to do so. What is wanted is something that will reach the do-nothing class. I can scarcely believe it to be true that the Central Chamber has passed a resolution recommending that no permanent improvement, such as draining, erecting farm premises, or cottages, shall be effected without the owner's consent in writing. If done without this all claims to compensation to be forfeited. It has long been one of the most ridiculous features of our crude old customs to give a premium for collecting together a pile of combustible materials in the shape of farm buildings. A wooden house, barn, and stable, and two or three post sheds, and your claim to compensation is admitted. But if you have built a substantial cottage, or other building of brick and slate, all you get from valuers is a significant shake of the head, followed by the word "No claim—great hardship." They tell us to admit this would be an interference with the rights of property. Well, the rights of property are a difficult thing to understand. When you discharge your labourer you certainly allow him to carry off his tools. Is not the tenant-farmer equally entitled to carry off what he has brought at his own cost for his own use and convenience, or what would be still better, why not give compensation to the extent such improvements have contributed to increase the letting value of the estate? There is just one other point. I believe the Central Chamber propose to give power to dilapidate where the general condition of the farm is not satisfactory. This would be a serious power to place in the hands of valuers, and would lead to never-ending disputes and litigation. A succession of wet seasons, despite all efforts, will neutralise to a great extent the labour of both

man and horse, and this power might be used in a ruinous manner, and would contribute in no small degree to throw much inferior clay land out of cultivation. Many estates are thoroughly neglected, the owner being non-practical, and, to mend matters, injudicious in the selection of his agent, and so the estates suffer for want of practical supervision, and would it be wise for the State to give to such a guarantee for the good management of their lands? The rent-roll of this country is a standing proof that the balance of condition as regards the land, if taken every ten years, is greatly in the landlord's favour. Then let us have no penal statutes hanging over the heads of struggling tenants. Mr. Arch charges our Chambers of Agriculture with having done nothing. They will, no doubt, think he has done a little too much. Certainly we do not pretend to shake England; it has taken us a long time to expose and impress upon the Legislature the injustice of our old friend local taxation. We have now passed him up to higher quarters, where, no doubt, he will give some tough work. In my opinion the Government that deals with that question, and brings it to a just and satisfactory settlement, and also gives to the country a Tenant-Right Bill, based upon sound principles, will be entitled to as large an amount of popularity as the Government that dis-established the Irish Church and passed the Ballot Act.

Mr. J. WALKER (Nattersea), thought some care ought to be taken not to inflict expenses on landlords which they ought not to incur. There were small owners and large owners, and small holdings and large ones, and recollecting the large number of farms in England under 50 acres, and that small tenants might erect buildings that would suit no one else, he thought it would be a hard case for the landlord to pay for buildings erected by tenants to gratify their own caprice. Speaking as a landlord and tenant as well, he thought it was desirable the consent of the landlord should be obtained before any buildings were erected. At the same time the tenant was entitled to compensation for whatever gave additional letting value to the estate.

The CHAIRMAN said he would briefly state what he considered was the feeling of English landlords on this question. As Mr. Godber had told them, this subject was introduced into the House of Commons, but no conclusive result was arrived at. There was sufficient discussion, however, to show that the question was considered to be one of great importance. He did not think English landlords would wish to reap where they had not sown, or to take advantage of the outlay of their tenants without compensating them for it, wherever that outlay had been beneficial to the estate. He heartily agreed with Mr. Walker when he said that it would be an objectionable thing to allow compensation where building had been done without the consent of the landlord. Mr. Walker mentioned instances where it might be prejudicial to the landlord's interests, and it certainly might interfere with any improvements which the landlords might consider it necessary to make. The building of cottages was a very great want and requirement in places where the labourers had to live in the town, but from his own experience he found that where cottages had been provided in some cases the ladies—it was always the ladies who were to blame—did not like to live so far away from the town. The men were willing to come, but the cottages were empty because the women would not live so far away. Therefore a tenant might build cottages about his farm, and, having a difficulty in filling them, expect his landlord to pay for cottages which were of no use. He thought that in any legislation the landlord would be entitled to some guarantee that he should not be called upon to pay for any unnecessary outlay. He felt convinced that compensation for any increase in the letting value would meet with no opposition from any one. [Mr. GODBER: That is all we want.] He must say he disliked permissive Bills, and he thought any measure should apply to all parties alike—be equally binding on all. If the tenant had made no outlay in what was a permanent improvement he would not be entitled to compensation, but if the tenant had laid out his money in what were material and permanent improvements of the estate he was entitled to receive compensation, so far as it increased the letting value, at his landlord's hands. To take any other course would be unfair, and he thought all men of sense and honour would agree upon that.

Mr. JOHN HELMSLEY said however much pleased he had been by the very able paper of Mr. Godber, he had been still more gratified with the remarks that had fallen from the

Chairman, because it was the want of a combination of opinion in an argumentative sense, that prevented them from agreeing on some basis for a legislative enactment, which might be considered of a permanent character. If landlords and tenants could meet as they do now, and express their views freely, casting forth that which was rotten and unsound to the winds, and retaining that which was weighty and sound and sending it forth to the world, they then would arrive at something like a proper basis whereby legislative enactments might be established. Mr. Godber had said that the discussions on this subject must be considered as for the purposes of legislation, and he (the speaker) thought that point must be conceded. Therefore the question could not be too fully discussed, and he was surprised that the landlords seemed rather to stand aloof from meeting this question as he imagined was the case with some. He was sure there was the utmost anxiety to obtain the assistance of the landlords in arranging some bill which would be likely to be of service to them, and he thought it was important that this should be done by the landlords and tenants themselves, instead of by parties outside, though if something was not done by those connected with the land it would certainly be taken out of their hands by parties outside. He considered that the question of drainage was in a very unsatisfactory state, and that it ought to extend over a much longer period. Mr. Godber started the point that legislation should be compulsory, except in the case of a seven years' lease. He considered this gave rather an important turn to the subject, and one which would meet the views of some landlords who seemed a little nervous on this compulsory question. He was, however, inclined to think that under the present Egyptian cloud that overhangs the British farmer, a lease of seven years would not be received with general favour. Where pressed it might give a certain amount of freedom to owners, without producing the desired result. Whatever measure was submitted, he thought should have the freest discussion throughout the country. The last bill, introduced by the Marquis of Huntley, was one of a crude character, and passed over the interests of owners in a captious manner, so that the field seemed now to be open for a measure which might be agreed upon by both landlord and tenant, and to attain that end it must be freely discussed.

Mr. NEVILLE said when he read a paper on this subject before the Newark meeting, he opposed the 12th clause in the late bill, because it interfered with freedom of contract. There was not a single landlord who made any communication to him, nor one who told him he was opposed to the bill, but the opposition to it came from a number of gentlemen with whom he had lived on terms of friendship for many years—the tenant-farmers of Lincolnshire and Nottinghamshire. They considered it would take away from them the power of making any contract, and he, for his part, maintained that the tenant-farmer ought not to have his hands tied by any act of Parliament. From that point he really could not recede. The fact was, the resolution directed against the 12th clause was carried by 70 farmers without the least hesitation, and he would add that the strongest opposition to it came from the farmers of Notts., Lincolnshire, and the East Riding. Mr. Read, who, apart from all chaff as to his being "muzzled" by office, was a person who ought to know, had said there were not twenty men in the House of Commons who would pass the 12th clause, and it was really the tenant-farmers who made the opposition so strong. The farmers now had more power than the landlords; the present Parliament, as far as the county constituencies went, was elected under the ballot. At the same time he would admit that there was room for a most useful bill to be passed. He considered that any bill which dictated any particular Tenant-Right would be most injurious, especially if it called in arbitration. Having remarked that the Marquis of Huntley, in his late bill, made out a strong case for compensation, he said that for his part he should always be disposed to deal fairly with his tenants, if, for no other reason, that if his 4,000 acres were thrown on his hands he should have to spend £45,000 in farming the land. His tenants were quite secure against him robbing them. He thought the best course would be for the landlords and tenants to freely discuss the matter, and he would add that if any of his tenants brought him an agreement which he could sign without doing himself harm he would sign it with pleasure.

Mr. GILBERT said he had always thought that a bill establishing the payment of compensation for permanent improvements would be equally advantageous to the landlord as to the

tenant. He mentioned an instance in which the absence of a law had worked unjustly, and said a short bill would facilitate matters, but as to Tenant-Right, owing to customs being so various he thought a permissive measure would best meet the case.

The CHAIRMAN then moved a vote of thanks to Mr. Godber for his very able paper, which was seconded by Mr. WALKER, and carried unanimously.

Mr. GODBER, in reply, said he was rather surprised to find his views pretty nearly in accordance with those of every other gentleman who had spoken. In reply to Mr. Walker, he would not have the landlord charged with anything but what had improved the value of his estate, because it was just possible some tenants might have peculiar crochets. Some might fancy dogs and build large kennels, whilst others might fancy poultry, and therefore nothing ought to be considered but what improved the letting value of the estate. Then, again, they could not legislate for any particular cases, and certainly concessions must be made to both parties. He was pleased by the line of argument taken by the chairman, and if all the landowners were like him or the Duke of Rutland, they would have no need to talk about improvements. He had his own views about the Central Chamber. The Central Chamber consisted of a number of landlords who took the greatest interest in improving their estates, together with the cream of the tenantry, men who lived under noblemen who did everything they asked for. Such a body, however, was not a fair representation of the agriculture of this country. They no more represented the struggling life of agriculture than the West-end did the struggling life of London. As to the 12th clause in the late bill, the feeling seemed to be calming down, and by discussion, and each party giving way a little, he had no doubt some proper arrangement would ultimately be arrived at.

At a meeting of the Devon and Cornwall Chamber of Agriculture at Modbury, Mr. Wm. SNELL introduced the subject of "Legislation with regard to Compensation for Unexhausted Improvements." He said: If agriculture had remained stationary, there would have been no object for their meeting that day. He had heard his father say that he was the first man who found it necessary to hoe turnips in the field. As to compensation for improvements formerly, improvements were then never effected. There was, therefore, no necessity then for what they were talking about that day. The necessity for legislation had now become urgent, because more capital was required and the population had increased. They should remember that any well-digested scheme, receiving the approval of that meeting and of the Central Chamber, and the other chambers throughout the country, might possibly influence future legislation. He wished to show them the magnitude of the capital employed in the business in which they, as farmers, were engaged. Under Schedule B the tenant-farmers of England were assessed to the income-tax at about £60,000,000 a year; and when speaking of rent they should turn the £60,000,000 into £120,000,000, because they were assessed at one-half their rental. Then £20,000,000 was to be added for small holdings—one-seventh of the land of England—and this made the rental value of the agricultural land of England £140,000,000. If they took the fair number of years' rental that was required to farm an estate, they would see the amount of capital used in their business. Farming an estate in a proper manner could not be done with less than six years' rental. If the rent were £140,000,000, and they required six years' rental, the capital meant £800,000,000, which was more than the national debt, and more than all the other capital throughout the length and breadth of the land. The farmers outweighed all others so far as capital was concerned. Let them look, too, at the importance of the work in which they were engaged—providing food for the people. Then as to the present position of the occupiers of the soil. There was one class not so numerous as it should be—the tenant farmers—some protected by lease—and he called this the perfection of the holding of land—and receiving compensation for unexhausted improvements at the end of their term. Nothing could be better than this, but this protected class was only a small body. Then there was another class who had their estate for a term of years; but with no clause for compensation at the end of those years; and there came the evil which they wanted to provide against. They wanted the land not only for their own sakes, but for the sake of the community, and not to be "sharpening out" every seven or 12

years, but always in good condition. Then there were tenants-at-will; and more than half the land of England was thus let. What position was this, for a man to farm with spirit? When there was a clause for compensation, there was no excuse for not farming; well but when there was no clause for compensation, a man farmed well for only a certain number of years, and then swept all he could into his pocket. So far as the tenancy-at-will was concerned, there was no inducement for a man to farm well, because if he put his property into the soil he put himself into the power of another man, and much as he (the speaker) respected the landlords of England, he should not like to trust to any man. He wanted a law to protect his capital, as well as that of the landlord, who had a law to protect his. He knew a tenant who was turned out of his holding at the end of the first half of his term. He was as good a practical farmer as he had ever been acquainted with, and he farmed the estate well, for he had put a lot of capital in his soil and was looking forward to the last seven years of his lease to recoup himself. He set up a claim for compensation, but of course, got not a farthing. A serious loss accrued to him; and every tenant under the same landlord said, "Who knows how soon my turn will come?" Consequently they refrained from putting property into the land, and the land suffered thereby. In Cornwall there was a man of title, who died, and left his property to a scapegrace son. It soon got into the hands of the Jews, and on quarter-day all the tenants that could be made to go had notice to quit; and they had to quit, leaving a lot of capital in the ground, but they received not a farthing compensation. The Jews did not, like Shylock, have the pound of flesh because it was in the bond; but they turned the tenants out because there was nothing in the bond to prevent them. As British farmers they asked for security for their capital in a shape that no reasonable or honest man could object to. They said that when a farmer entered into an estate and effected certain improvements, and was there for a certain number of years, he should have no claim on the landlords, because he had been on the estate long enough to recoup himself, but if he had not been there long enough to do so the landlord must pay the little bill. A farmer could effect an improvement at half the cost that the landlord could, and if the arrangement suggested were carried out, it would be a great benefit to the tenant and to the people. The knotty point between the landlords and tenants was just this. The landlords said Parliament must pass a just law with reference to compensation, but it must be left with the landlords to say whether they would come under the operation of the law or not. That would be a permissive bill, and would not be worth the paper it was printed on, but would be a snare, a mockery, and a delusion. The principal argument used by farmers against an alteration of the law was that they had the farm much cheaper because they were to have no compensation, and, therefore, it would be better to leave well alone. If he went into a farm as a mere slug, he would farm on those conditions, and would never improve, and never invest any capital, so that he could not have it taken away. But he would much rather pay a full rental for the estate, have his capital secure, and be free. They did not want to be servile to the landlord, humble to the steward and congenial to the keeper, for fear of being turned out. They should hold up their heads as men, and live in an independent manner. It was said that landlord and tenant met as man and man, and could make such terms as they pleased. That was incorrect. Farms were decreasing, but farmers were multiplying, and if they wanted to take a farm, they had to take it on such terms as the landlord drew up. He hoped Mr. Disraeli would bring in a good bill, and be unfettered by party considerations, for the country would support him if he did well, and he had an opportunity of immortalising himself. Mr. Snell, concluded by proposing—"That the present position of agriculture, and the general welfare of the country, require early legislation respecting the tenure and occupation of land. That legislation for the purpose of protecting the landlords' property and the tenants' capital should be compulsory, excepting in cases where they are mutually and fully protected by lease or agreement."

Mr. ANDREWS remarked that where there was no trust there could be no mistrust. He had a little land and good tenants, but he did not want to trust them, nor did they want to trust him. When Mr. Snell spoke of the £800,000,000, it should be remembered that there was a good deal of moving stock in that; but still, there could be no doubt that there were a few millions in the hands

of the wrong men. He seconded the resolution that had been proposed. An Act of Parliament should be binding under every circumstance and condition in matters affecting agreements between landlords and tenants.

The resolution was unanimously carried.

THE BALA SHEEP-DOG TRIALS.—At Garth Goch, on Wednesday, Oct. 14th.—Judges: Messrs. John Williams, Griffith Jones, and R. V. Jones.

RHWAEODG STATES, for dog or bitch puppies of 1873; entrance, 10s.; first prize £5, second £2 10s., third £1 5s., fourth 15s.

John Williams, Bryneinin, Darowen, Machynlleth, bk t Black, 2 years 1
J. Robson, Hafod, Minera, bk w Fan 1 yr. 5 mos. 2
Four others were tried. The winner greatly distinguished herself, while Mr. Robson's Fan lost one of her three sheep, but folded the other two pretty cleverly, showing a little impetuosity, which seemed to have caused the loss of the sheep. She was the winner of the stake at the recent trials held at Llangollen.

PENLLYN STAKES, for all-aged dogs or bitches; entrance, 10s.; first prize £5, second £2 10s., third £1 5s., fourth 15s.

Robert Roberts, Blaenycod, bk t b Handy, aged ... (div.) †
Edward Pugh, Tanybwlch, Dinasawddy, be d Scott 4

yrs. (div.) †
Thomas Dobie, Graiguchaf, Llanbedr, bk w Drenny, 7 yrs 3
Robert Morris, Tynawr, Llaagynog, bk w Jack, 5 yrs. 4

Fifteen others were tried. In the last trial Handy No. 1—and A1, as it turned out—was first selected. Down the hill came Handy at a fearful pace, wasting not a jot of time in "coming to terms" with his three sheep; but these, being just released from a fold which contained some dozen future victims, declined for some minutes to part company with their comrades in misfortune; but our sheep-dog finding them obdurate, and too wise to use force of any sort, vocal or physical, contented himself by driving the sheep a step or two at a time, and then lying down, giving, we presume, by this means time for the inferior animals, as we must fain designate them, to consider that the open country and the chance of "a run for it" were better than the continued effort to rejoin a set of not over-hospitable companions. These tactics succeeded; for Handy, after feeling his sheep up as far as the turnips, of which half the field of operations was composed, was enabled to put "the steam on," and deliver them, in the very sense that his name applies, to his master, Mr. Roberts, after eight minutes had only elapsed; the sheep, one old ewe and two wethers, being anything but an accommodating trio.

BARREN HONOUR.—It would not be difficult to gather from the pages of our bucolic contemporaries, *The Mark Lane Express* or *The Farmer*, that breeding and feeding stock for the edification of the urban population are far from being profitable operations. Whether the complaint has its rise in the indiscriminate grumbling of our broad-wheeled neighbours is hardly worth considering; certain it is that the exhibiting of stock—and especially of fat stock—is not unfrequently designated more a fancy than a paying concern. If such is the sad state of matters in England with feeders, the case appears to be very much worse with the enterprising exhibitors who send their animals abroad. A successful farmer does occasionally manage to secure a prize of £30 or £40 with a beast that pleases a judge's eye at a "Royal" or a local show, and to that extent is of course recouped for his outlay in bringing a symmetrical animal into the stalls to be stared at and poked with umbrellas by a crowd of town-folk who know as much about the "points" of a prime ox or an Ayrshire cow as they do about Chinese metaphysics. But they compensate exhibitors differently on the Continent, according to the story related by Mr. John K. Fowler in *The Times* of yesterday. The fortunate breeder, of Prebendal Farm, Aylesbury, informs the readers of the leading journal that the merits of the exhibits which he forwarded to the agricultural department of the Vienna Exhibition were so far recognised by the judges that they were awarded bronze medals. The prizes, Mr. Fowler tells us, were awarded; but, notwithstanding "the repeated applications of myself and others to the proper authorities, we can neither get our medals nor any answer to our requests." An authority has told us that "he that drives fat oxen should himself be fat;" but the Austrians are evidently desirous of showing us that he who exhibits fat oxen is bound to be fooled.—*The Sportsman*.

THE FARMERS' AND THE LABOURERS' INTERESTS.

Mr. C. S. READ, M.P., at the Blofield and Walsham Agricultural Association, after presenting prizes to labourers who had been successful in competition in various departments of husbandry, said: Two years ago at Blofield I tried to persuade those present from joining the Labourers' Union, for seeing before me then, as I see now, the picked men of the district, men who had proved themselves skilled, industrious, and careful labourers, I contended that by joining the Union you would place yourselves on a level with the unskilled, the idle, and the careless, and further assured the old men that the bait held out to them by the Union of having a pension in their old age was an impossibility. No doubt you thought that my advice was founded on a farmer's desire to keep down wages, but I would remind you that four or five years ago, before we heard of Unionism in Norfolk, I suggested a payment of 12s. a week, even in the short days of winter. I fancy my Blofield advice, like most other advice which cost nothing, was unheeded, and some of you became members of the Union, and thus compelled the farmers to form a defence association. When Unionism was first started in my parish I called my men together and said, "I pay away in labour more per acre than any other tenant-farmer in this district; if you don't join a Union, which avowedly intends to force me to give you more wages, I will not join any association of employers;" but they did, and as a result I am a member of the Farmers' Defence Association. It was simply self-defence. I have sacrificed my independence for safety, but I think I have this pull over your Union—that whereas my orders will come from a centre of Norfolk farmers, yours are issued from Warwickshire or Lincolnshire, by men who can know but little of the real state of things in Norfolk. Unions may temporarily raise wages by strikes in busy seasons, but no permanent advance can be secured unless you reduce the supply of labour or increase the employer's profits. No combination of employers can keep down wages when hands are scarce, trade is brisk, and profits are large: no combination of labourers can keep up wages when hands are plentiful, trade dull, and profits small—certainly not when losses are great. Unionists argue that labour has not received a fair proportion of the profits, and that capital has received the lion's share. That may be the case in some industries; but is it so in farming? When the coal and iron masters of the kingdom agree to put up their half-a-crown a ton, they can very well afford to pay their men an extra price for raising it; but if all the farmers of Norfolk or, indeed, of England were for once united, they could not raise the price of wheat 2d. per bushel. It was said this year by a high authority in the House of Commons that the wealth of this country had increased during the past five years to the astounding amount of £1,500,000,000. I fail to comprehend so vast a sum, but, after taking out Sundays and holidays, it is something like a million a day increase. How much of that increased wealth has found its way into this quiet locality? Landlords know their expenses increase, but I am not aware that there is any general rise in rents. It certainly requires more money to stock a farm, but I do not believe tenants' profits are any larger. You have been earning better wages than you ever did before; yet you with large families doubtless find it necessary to spend more, and you young men discover that skittles, beer, and sweethearts swallow up all your cash. I therefore come to the conclusion that only a microscopic proportion of the "leaps and bounds" of England's prosperity has fallen to agriculture, and of that little a chief part, at any rate a large proportion, has been secured by the labourers. If the foundation of your Unions had been right, they must have prevailed in the Newmarket Lock-out. The whole world was on your side. A bishop said the "farmers were mad," noble lords sympathised with you, M.P.'s raised their voices and opened their purses on your behalf, Trades' Unions gave you money for support. Public opinion was entirely with you, and so was the whole London Press. The contest was carried on for six months in the busiest part of the agricultural year; and at harvest, when you were assured your triumph would be complete, your leaders, with cruel irony, told you they could no longer maintain you in idleness—an idleness which they themselves enforced. But strikes open farmers' eyes. I had two last year, and in consequence I managed to reduce my

labour account £100. It may be done by employing new machinery, keeping more land in grass, putting out work, employing fewer regular labourers and hiring a few odd hands when they are wanted; but the chief saving is in leaving much of the neat work of the farm undone. Time was when an untrimmed fence, a rough ditch, a few great stones, some sprawling weeds among the turnips, or even runaway mangolds, were pain and grief to me. I now regard them, if not with complacency, certainly with indifference. If this sort of tidiness can be secured at a certain price, as I am happy to say it can be now, the work is done; if not, it remains undone, for I know the farm cannot afford it; and if it could, no one nowadays thanks the farmer for employing profitless labour. We have been told that all the objectionable rules of the Union are withdrawn. I do not profess to know what they were. One, I believe, was that Unionists might strike at a week's notice. My experience is that they strike without any notice at all. Another was against piecework, which I contend is the only way in which a skilful and dexterous labourer can secure his fair wages. Shorter hours are demanded, while you know that, excluding hay and harvest, when you receive extra wages, your day's work does not average nine hours. Lastly, the Unions are dead against yearly hires. I have said that in matters of work and wages I should make no difference between Union and non-Union men. But I find, as I hire my team-men by the year, with so much extra weekly wages and so much standing wages payable at Michaelmas, I must have non-Union carters and shepherds, or, if they are Unionists, they break the rules of their order. Now, suppose farmers hired their cart-horses as well as their men, and one jobmaster should order horses by the year and another by the week, with full liberty to deprive the farmer of the horses when he most needed them, would not the farmer pay more for the yearly horses and take more care of and feed them better than the others, and would he not most probably say to the other offer, "I shall prefer hiring your horses only when I really want them, even if I pay double the price you ask per week?" Apply that to labourers and compare the yearly agreements of the North with the weekly hire insisted upon by the Union. I find the average pay of a common day labourer for the whole of last year was about 17s. 6d. In Northumberland and Scotland I am assured the value is nearly 25s., which, after making all allowances for locality, better market, &c., is greatly in favour of the long hire. Then take the farmers' interest. Mr. Barclay, the member for Forfarshire, is, like me, a tenant-farmer, but, unlike me, he is fortunately a successful merchant as well. He farms 380 acres of arable land, which is exactly the amount of land I have at Honingham. He has 75 acres of rough pasture, and I have 40 acres of good permanent grass; he grows 20 acres more corn than I do, but he has less roots and more grass seeds than I have. Taking the cold, damp northern climate into consideration, I should say he would require as much manual labour on his farm as I do on mine. But mark the difference. For the four years ending 1871 the average annual payment for labour (two-thirds in cash and one-third in milk, meal, potatoes, &c.) was £400, while mine was £750. In 1872 and 1873 Mr. Barclay's had risen to £510, but as he puts £30 of it down to extraordinary labour, he considers the real increase to be only 20 per cent. Now, take my expenditure for those years, which, being about £850 and £750, would average £800, and you must surely admit that which I knew long ago—that the Scotchman is a sharper and keener man of business than I am; and I also come reluctantly to the conclusion that the highly-paid Scotch hind is a cheaper and better man than the Norfolk labourer, and that after all there is no such thing as cheap labour. Let us, the employer and the employed, take stock of our altered positions. You have elected to be independent—that supply and demand shall rule wages, that you will sell your labour in the dearest market, and, therefore, we farmers must buy in the cheapest; that labour should combine; and consequently capital must do the same. I believe your choice, if you will give over striking and the absurd features of Unionism, will in the end be better for us both. We certainly need no worse friends. Two independent parties, if they really understand each other, do not want to quarrel

you may be less subservient, but quite as civil, and the farmer may be more mathematically just without being harsh or unkind. But I must impress upon you that you cannot expect to retain all the advantages of your former state. You must not be independent in the matter of wages only, but also be self-supporting and self-reliant. If you desire better pay, you should devote your energies to doing better work rather than to striving so hard for the greatest possible amount of pay for the least possible amount of labour. If you desire better cottages from the landowner, you must not expect to hire them at half their value; neither must you any longer expect your employer to find you employment all the year round, wet and dry, whether he wants you or wants you not; nor ask him to pay you full wages because you are an ailing man and have a sick wife or a house full of small children. Above all, you must not look to the rates to support you in sickness and old age, nor to the parish doctor for medicine and porter; and though, as long as women have kindly hearts, the farmer's wife will still dispense her kitchen and dairy comforts, you must not regard them, as so many do now, as matters of business rather than of charity. If you find yourselves too numerous, instead of striking or shirking work, the young and vigorous men must emigrate to the North or to the Colonies. They will find 15s. in Norfolk go quite as far as a guinea in a manufacturing town, and if a strong, active, and sober labourer is careful and industrious abroad he can soon save a lot of money, and so, I must add, in a limited degree, can any healthy, unmarried young man who will practise the same self-denial at home. The object of your leaders seems to be a desire to make every labourer discontented with himself and jealous of all around him; but the unerring Word of God has said, "The poor shall never cease out of the land," and, therefore, you should use every legitimate means to improve your condition and work yourselves into a better one, rather than repine at your lowly lot. Both parties should rule their relations one to the other upon the golden maxim of doing to others as they would be done by; and while the labourer must not forget the declaration, "Ye have the poor with you always," we farmers must specially remember the gracious words which followed—"And whosoever ye will ye can do them good." It has been charged against me that when I became a member of the Government I committed political suicide. Reading the criticisms in the agricultural papers and the speeches now made at agricultural meetings and at farmers' clubs, I have arrived at the conclusion that I was something like "the dear departed husband," who had become a perfect saint when dead, but who, somehow or other, contrived to beat his wife when alive. Whenever I am silent upon an agricultural question discussed in the House of Commons, I am sure to be "twitted;" but it was not until I had duly considered my constituents' interests and my own position that I ventured to accept the post offered me by the Prime Minister.

I regarded it as a great compliment paid through me to the constituency, and thought I ought to accept it unless there were good and sufficient reasons for not doing so. Without egotism I also believe that the post offered me was one that I could fill, being mainly connected with the administration of the Poor-law, to which I have always paid particular interest. As to the legislation of the past Session, very little had been done, it was true, but the department with which I am connected, the Local Government Board, had passed one good measure, the Rating Bill. For that bill I have striven since 1868. For its necessity in the interests of justice, among other instances, there was the fact that the ironstone mines, with all the wealth they returned, had not contributed a sixpence to the local rates. If nothing else had been done, the passing of that useful measure entitled the Government to their thanks. As to future agricultural legislation, although of course, I could not bring in the Tenant-right Bill which had been before introduced by Mr. Howard and myself, yet, having access to "the powers that be," I lost no opportunity of insisting that compensation to tenants for unexhausted improvements ought to be embraced in a measure next session. Answering an imaginary question, "How do you like your official life," I say, "I don't like it at all." To the office work I have no objection, and I consider the permanent officials of the Government Board an excellent, meritorious, but underpaid class of public servants; further, I have no objection to committee work, but I do not like the House of Commons. After being at the office from eleven to

five o'clock I am marched down to the House, with a certainty of not being able to leave it for dinner or for a walk until one o'clock. Nothing so dull, tiresome, and irksome has been experienced by me since I went to school. In fact, I might alter the nursery rhyme thus:

Speak when you are ordered,
Vote as you are told;
Make a house, keep a house,
Or the Whips will scold.

I assure you I have at heart as much as ever the interest of the tenant-farmers of England, and I shall use my utmost endeavours to see that it is not forgotten; and if I find that your cause is wilfully or even carelessly disregarded, I shall not long continue to be a member of Her Majesty's Administration. But I do not believe that it will be. On the contrary, when the time comes you will find that Her Majesty's Government is quite prepared to do justice to the tenant-farmers of England.

"THE COW THEORY."

TO THE EDITOR OF THE MARK LANE EXPRESS.

SIR,—In your account of the speeches delivered at the luncheon on the occasion of the sale of Mr. Henry Stanley's farming effects, at Pornham Lodge Farm, Bury St. Edmunds, Mr. Hunter Rodwell, the new member for Cambridgeshire, is reported to have said, "he believed the time was very far distant when the 'cow theory' would come into operation—the theory, that a man with five acres of land should maintain himself, his family, and a cow. If Lord Bristol, the Duke of Grafton, and Mr. Benyon, for instance, were to give up five acres each to all who wished it, he thought it would not be very long before some large capitalist bought up all the cows and calves." With this opinion of Mr. Rodwell I should probably have been inclined to agree, had it not been proved to me last year, while on a visit at Sir Baldwin Leighton's, that exactly the contrary is the case, where the "cow theory" has been in actual practice for many years. On Sir Baldwin Leighton's estate in Shropshire pauperism is almost exterminated by means of the cow, it being the rule rather than the exception for a labourer to have sums varying from £20 to £80 put by in the savings bank, out of the proceeds of the sale of butter. I have seen the books with the sums entered to their credit. Most cottages have two or three small fields attached to the holding, mostly laid down in grass. The cow, however, is only a second string to the labourer's bow, and does not in any way interfere with his giving efficient service to the farmer as the cow can be looked after by the wife, who makes the butter and sends it to market by the carrier.

I am only too well aware that there are many districts, where, from the lightness of the soil and a small rainfall, it is almost hopeless to lay down land in grass, and where the "cow theory" will not work, but I am anxious to point out what a great boon the cow is to the labourer where grass will grow, as it will in a large portion even of East Anglia, though not on the light lands of Norfolk and Cambridgeshire.

Yours faithfully,

W. H. HALL.

Six Mile Bottom, Newmarket, Oct. 14th.

ANOTHER AGRICULTURAL COLLEGE.—At a committee meeting of the North-east Agricultural Association of Ireland, a communication was read from the secretary of the Society of Arts, London, asking the co-operation of the North-east Agricultural Association in the founding of an Agricultural College, in which it is proposed to hold periodical "examinations in the technology of agriculture, and rural economy, with the view of promoting a more extended and intelligent study of agriculture and of the sciences bearing upon it."

CONTAGIOUS DISEASES (ANIMALS) ACT.

A meeting of the committees appointed by the local authorities of the counties of Aberdeen, Banff, and Moray, to bring the state of the existing law as to contagious diseases among animals under the notice of the Duke of Richmond, President of the Privy Council, who controls the Veterinary Department, was held at Keith. There were present—on behalf of Aberdeenshire—Sheriff Comrie Thomson, Colonel Innes of Learney, Mr. Barclay, M.P., and Mr. Scott, Glendronach; on behalf of Banffshire—Sir George Macpherson Grant, Bart., and Mr. Garland, Cowhythe; on behalf of Moray—Dr. Maclean, Elgin; Provost Cameron, Elgin; Mr. Geddes, Orkliston; Mr. Williamson, Shempston; and Mr. Yule, Coullard Bank; Sir George Macpherson Grant in the chair.

Sheriff THOMSON having explained the circumstances under which the committees had been appointed by the three counties, stated that the Aberdeen Committee held a meeting on Friday for the purpose of coming to an understanding as to the matters to be laid before the Duke of Richmond. The first defect in the existing law related to the period during which a place infected with pleuro-pneumonia was subject to the restrictions of the Act after the last Irish case. The Aberdeenshire Committee were unanimous in thinking the period of thirty days too short. The second was that the provisions of the Act for enforcing the slaughter of cattle affected with pleuro-pneumonia should be put in operation in Ireland as well as in England and Scotland, as the experience of this district showed that the importation of Irish cattle was a fruitful source of the disease. On this matter, too, the Aberdeen Committee was unanimous. And the third point related to the remissness of certain local authorities, and the want of uniformity in enforcing the law throughout the kingdom. In the counties here represented the provisions of the Act were, he believed, properly enforced; but there was too much reason to believe that in certain counties comparatively slight efforts were made to exterminate disease.

The CHAIRMAN suggested that these points might be discussed one by one.

Mr. BARCLAY, M.P., said there was a general concurrence of opinion that the period of thirty days provided by the Act was too short, but differences existed as to how far it should be extended. Some thought sixty days sufficient, others thought it should be three months, and others even four months. The Select Committee in the House of Commons in their report had recommended sixty days. He had suggested three months; but on further consideration, he thought sixty days as long as could be effectively enforced. If the period were made three or four months, licenses for removals would be extensively required, and in granting licenses he feared laxity would prevail. Sixty days would be a great improvement, and as long a period as could be enforced with efficiency.

After fully discussing the question in its different bearings, the meeting were unanimously of opinion that although the disease might re-appear after a longer interval than two months, that period was as long as could be effectively enforced.

The second point—namely, that the provisions as to slaughtering animals affected with pleuro-pneumonia should be extended to Ireland—was then taken up.

Mr. BARCLAY stated that he was of opinion (and he knew that his opinion was generally shared by those taking a leading interest in the subject in England and some counties in Scotland), that they could not hope to be successful in exterminating this disease unless the same policy of slaughtering out was pursued in Ireland as on this side of the Channel. The efforts to eradicate the disease had been so far successful, but it was from time to time again imported into the country, and in the case of the north-eastern counties, investigation showed that a large proportion of the new outbreaks were due, directly or indirectly, to Irish cattle. He believed the slaughtering of diseased cattle would be more beneficial to Ireland than to England and Scotland, for he was sure he would be borne out in stating that the doubtful character of Irish store cattle as regards disease, depreciated their price in this country 10 to 15 per cent. It was clearly unjust that this country should be put to the heavy expense of attempting to slaughter out

the disease, so long as it was renewed by the import of Irish cattle. He believed these views were so strongly held in England that if the compulsory slaughtering was not extended to Ireland, strong representations would be made to the Privy Council by English local authorities to have the Order in Council for compulsory slaughter in England and Scotland rescinded.

Sheriff THOMSON suggested that the Duke of Richmond should be informed that the three counties were clearly of opinion that these provisions should be continued, and extended to Ireland.

The CHAIRMAN said that so long as they were bound to slaughter affected animals in Scotland and England, he saw no reason why Ireland should be exempt. The local authority of this country certainly approved of that provision.

Provost CAMERON said that they were also approved of in Morayshire. It was then unanimously agreed to urge on his Grace the necessity of rendering the slaughter of affected animals compulsory in Ireland.

NECESSITY FOR UNIFORMITY IN ENFORCING THE LAW.—The third point was then discussed, and the meeting was unanimous in thinking that there was great laxity in carrying out the provisions of the Act in certain parts of the kingdom, and that the Duke should be requested to give the matter his serious consideration, with the view of having the law more stringently and uniformly enforced.

Colonel INNES thought it might be well to suggest to his Grace some way by which it could be enforced more strictly and uniformly, whether by the appointment of Government inspectors or otherwise.

Sheriff THOMSON concurred in thinking it might be desirable that Government inspectors should be appointed, but thought the details of the matter might be left to the Duke.

Mr. GARLAND complained of the number of Orders in Council in force, and of the difficulty experienced by local authorities in understanding the law they had to carry into effect.

The meeting concurred in the view that a simplification and consolidation of the various Orders in Council were extremely desirable; and if a settled policy in dealing with disease was adopted and adhered to by the Government, local authorities and the public generally would become familiar with the law, and have much less difficulty in carrying out the various regulations.

Mr. BARCLAY then called attention to the fact that in most counties there were several local authorities, and in consequence a want of uniformity of action. He thought it very desirable that the burghs should be amalgamated with the counties in which they are situated, with proper representation of the burghs at the county board. He had brought this under the notice of the Select Committee of the House of Commons, and they had reported that amalgamation was desirable in Scotland, that the general expenses should be levied over the whole district, and the cost attending the slaughter of cattle only over the burgh or landward part of the county wherein the slaughter takes place.

The meeting unanimously agreed that this alteration of the Act should also be recommended to the Duke of Richmond.

Sheriff THOMSON then moved that a deputation should be appointed to wait on the Duke of Richmond, and bring these matters under his consideration. This was agreed to, and three gentlemen were chosen from each of the three counties. For Aberdeenshire, Sheriff Thomson, Colonel Innes, of Learney, and Mr. Barclay, M.P.; for Banffshire, Sir George Macpherson Grant, Mr. Taylor, of Glenbarry, and Sheriff Gordon; and for Morayshire, Provost Cameron, Dr. Maclean, and Mr. Geddes, Orkliston.

THE YORKSHIRE WOLDS. — Major Cochrane, of Langton Grange, Darlington, has just hired for a long term Lord Walsingham's house on Aldwark Manor, near Easingwold, as well as one of the principal farms on the estate. — *York Herald*. [It would seem from this that Lord Walsingham has settled down to Norfolk as his home county.]

THE PLEURO-PNEUMONIA ORDERS.

At the meeting of the committee in Norwich, a discussion took place on a motion, of which notice had been given by Mr. Jex Blake, as follows, namely, "That the Court of Quarter Sessions be requested to present a memorial to the Privy Council, praying that the order of the 2nd August, 1873, as to the slaughter of cattle affected with pleuro-pneumonia, be extended to the whole of the United Kingdom; or that such order be rescinded?"

Mr. JEX BLAKE duly moved his resolution, which was seconded by Mr. R. Gillett.

The Earl of KIMBERLEY said the line he took on the subject in the few remarks he had made this year in Parliament was very much the same as that indicated in the resolution. It was clear that if the experiment of slaughtering cattle affected with pleuro-pneumonia were tried it must be tried fairly. It was ridiculous to pretend we were trying the experiment when we were slaughtering only in one part of the kingdom and not in another. The thing was so absurd, as he said in Parliament, and no one could venture to say a word in reply. He consulted the late Lord-Lieutenant of Ireland, Earl Spencer, who had much experience in Irish affairs, on the subject, and he said that he thought the Order ought to be extended to Ireland. Although pleuro-pneumonia might not be had now in Ireland, yet it had been bad there. When he lived at Phoenix Park it was impossible for him to keep a cow alive, so bad was pleuro-pneumonia. Having Government money to spend he took the greatest possible pains; but as fast as he got them in they died. Phoenix Park was a hotbed of disease. It was a place where agist stock were taken in, and as it was not far from the markets, it might be imagined how the disease spread all over the country.

Mr. C. S. READ, M.P., said there was now a very rigid examination at the ports of embarkation in Ireland, and that the Privy Council were doing all they could by inspection to prevent the spread of the disease. That was what Privy Councils in England and Ireland had relied upon. But it was utterly impossible to detect a disease which was for so long a period incubating.

The Earl of KIMBERLEY: Absolutely impossible.

Mr. READ said that there was said to be very little pleuro-pneumonia now in Ireland, but that did not prove to his mind it did not exist. The Government would find that the moment they gave compensation to owners of stock in Ireland affected with pleuro-pneumonia it would be found there would be many cases where there now was one. Speaking of the extent of the

disease in Norfolk they were constantly being laughed at in the Privy Council because it was considered to be the most diseased county in England. Of course it was, because it was where there was sent the residuum of everybody's stock. If an ordinary bullock could not be sold in Ireland, Scotland, or Wales, as a matter of course it came to Norfolk, where it found a market. And then they were told, after they killed an extraordinary quantity of stock—no less than a thousand a year—and paid upwards of £5,000 out of the county rate as compensation and inspectors' salaries, that they were not doing their duty. But he contended that Norfolk was doing its duty to the best of its power, regardless of the cost and trouble inflicted upon the owners of stock. When they applied to the official of the Privy Council for advice they were recommended to separate the healthy from the diseased cattle, and were told to take the temperature of the animals every morning to ascertain whether they were likely to become subject to the disease. He should like an inspector from the Privy Council office to be stationed on the Yarmouth marshes to have the fun of introducing a thermometer into the rectum of a bullock on those marshes, and he feared he would be sick of the performance at the end of the week (laughter), and when he returned to London he certainly would not recommend any such tomfoolery to them in Norfolk in future. The theory propounded by the veterinary surgeons of the day was that pleuro-pneumonia could only be communicated by the breath of a diseased animal. Therefore a lot of cattle might be huddled together and if there was not a diseased or partially diseased bullock amongst them they would not have pleuro-pneumonia.

The Earl of KIMBERLEY supposed the breath of diseased animals was blown a long distance, for an animal belonging to him that was never in communication with any diseased animal had pleuro-pneumonia; and what was more remarkable, none of the other animals took the disease. No doubt there were some indigenous cases of disease. The sudden change of climate had perhaps something to do with the disease of Irish cattle. There was a vast difference between the climate of Ireland and that of Norfolk, especially at the time of year when cattle were brought over. Many animals predisposed to disease then ran considerable risk. This was a strong argument for bringing over only thoroughly sound cattle. Cattle coming from Galway and Balinasloe markets experienced a great change of climate, which had no doubt much to do with the disease.

The resolution was unanimously agreed to.

THE CONTAGIOUS NATURE OF PLEURO-PNEUMONIA.

Recent investigations have thrown much light on the contagiousness of pleuro-pneumonia, and the means by which the disease extends the area of its existence. Like some other diseases affecting cattle which are known to be infectious, pleuro-pneumonia has been supposed to be easily communicated by disease to healthy animals, through various means other than that of actual cohabitation. It will be admitted that a correct solution of a question of this kind is of considerable importance to the best interests of the country, and that it must greatly assist local authorities in deciding what is best to be done to stay the progress of the disease. It has long been known that we have been dissentients to the views entertained by many veterinary surgeons, that pleuro-pneumonia—like cattle plague, for example—can be freely communicated by *fomes*. The failure of the so-called pleuro-pneumonia inoculations, so extensively practiced for upwards of twenty years, in Europe and elsewhere, to produce the disease in the animals operated upon, shook our belief originally in the facile contagiousness of the disease. As far back as 1853 we dwelt on this in our report to the Royal Agricultural Society on the inoculation of cattle, and the experience since gained has only tended to confirm the opinion then enunciated. The revival of the question consequent on the adoption of legislative measures for stamping out pleuro-pneumonia led us, in

1870, to have recourse to some further experiments with a view to its solution. The details of these were communicated at the time to the Royal Agricultural Society, and published in their *Journal*: "The first experiment consisted in exposing a steer to the inhalation of the vapour of some diseased lungs. For this purpose a dairyman's cow, suffering from pleuro-pneumonia in its advanced stage, was killed, and the lungs immediately removed from the chest and placed with the experimental animal in a closed loose-box, care being taken so to secure the head of the steer that at each inspiration the vapour should enter the respiratory organs. The steer was kept in this position until the lungs had become cold; but even then they were not removed from the box, it being determined to leave them with the animal until visible decomposition had begun. The animal was carefully watched day by day until the expiration of the tenth week, but not the least deviation from health was observed during any part of the time. Subsequently it was determined to repeat the experiment in a modified form, and for this purpose a sponge was placed in the nostril of a diseased cow, and allowed to remain until it had become thoroughly saturated with the breath and also with the mucus discharged from the nostril. It was then transferred to the nostril of an experimental animal, and retained there for upwards of half an hour. As in the former

case, the animal was closely watched for several weeks; but again no ill effects followed. Besides these two experiments, some mucus obtained from the respiratory organs of diseased cattle was rubbed, on several occasions, upon the mucus membrane of the nostrils of other experimental animals, with a view to effect its absorption. These experiments had also a negative result." Some additional experiments have since been instituted. It was first determined to ascertain whether any portion of the serous exudation from a diseased lung could safely be injected into the lungs of an animal. For this purpose two sheep were selected, and a drachm of exudation fluid injected into the left lung of each by puncturing the upper part of the chest with a small tubular stylet fitted to a syringe. The animals presently began to feed with quite a natural appetite, and did not apparently suffer any pain. They were kept under close observation, and their temperature registered day by day, but no indications of disturbed health were detected. Weeks passed away, and during the whole time they remained perfectly healthy. On April 10th of the present year two drachms of serous exudation from the lung of a cow, the subject of pleuro-pneumonia, were injected into the left lung of an eight months old heifer-calf. At the same time a like quantity was injected into the left jugular vein of another calf of the same age; and to a third calf, *seventeen days old, half an ounce of the same fluid mixed with two ounces of milk was given as a draught.* As no ill effect had been recognised in either animal by April 12th, an ounce of the same serous exudation

was given to the *young calf*, mixed with milk as before. A microscopic examination of the fluid showed the presence of Bacteridies in large numbers. On the 15th the young calf gave evidence of *blood-poisoning*, and on the evening of the 16th it died. No lesions, other than those common to blood-poisoning, were met with on a *post-mortem* examination, in any organ of the body. The heifer-calves, like the sheep, entirely escaped any pulmonary attacks; indeed, with the exception of a small slough being detached from the site of the puncture into the jugular vein, they have continued well down to this time—a period of upwards of five months. In the month of June last two other experiments of a similar kind were had recourse to, the subjects being a young steer and heifer, both about ten months old. Six drachms of exudation fluid from a diseased lung were injected into the lung of one animal, and the same quantity into the windpipe of the other. Both these animals gave indications of local disease in little more than a fortnight afterwards, and in another fortnight one died and the other was killed. *In both cases, however, the lungs were found perfectly free from these lesions which specially belong to pleuro-pneumonia.* It is thus conclusively proved that pleuro-pneumonia does not extend the area of its existence by any of the ordinary means which cause the spread of infectious diseases. Full details of these experiments will appear in next number of the *Journal of the Royal Agricultural Society.*—*The Veterinarian.*

SHROPSHIRE CHAMBER OF AGRICULTURE.

At the annual general meeting, Mr. Jasper More in the chair, the following report of the committee for the year ending September 29th, 1874, was read:

The committee, in making their eighth annual report, have to announce that during the past year the Society has lost through deaths, withdrawals, and removals, 57 subscribers, but has added to its strength by the enrolment of 45 new members. The number of subscribing members now on the books is 649. Two discussions have taken place in Shropshire during the last year. The first, an adjourned discussion on the poor relief, showed the feeling in favour of rigidly enforcing the workhouse test to be different at Wellington to what it was, as shown by a previous discussion at Ludlow. The committee wish to draw attention to the want of unanimity amongst different boards of guardians as to the principles of affording poor relief, and suggest that the various boards in this county should use their influence to bring about by conference or otherwise a greater uniformity of action in the administration of poor relief in the different unions. The object of the second discussion of the Chamber at Bridgnorth is shown by the following resolution proposed by Mr. B. Dudfield, seconded by Mr. E. Rainforth: "That this Chamber considers that the over-preservation of game and the absence of Tenant-Right are among the principal detriments to the improvement of agricultural land, and is of opinion that such a bill as that introduced into the House of Commons by Messrs. Howard and Read last session, and one to protect the occupying tenant from injury from over-preservation of game, are necessary for the improvement of such land." The committee are glad to find some concession made to ratepayers, though not so large as expected, in the manner of increased subvention to the expenses of police and lunatics. They regret to hear, however, as a matter of general rumour, that the Government are advised to stop the usual payment awarded to Shropshire on behalf of the expenses of the police, as well as the additional one, on account of the alleged inefficiency of the police force of the county. The President and Mr. Bowen Jones attended the Malt-tax deputation to the Chancellor of the Exchequer, but while the surplus at the disposal of the Government was unparalleled in amount no concession was made or any expectation held out to the agriculturists of their claims being considered in future. Only 18 members were found to vote for the repeal of the Malt-tax, when the subject being declined by Colonel Bartelot was taken up by Mr. Fielden. The committee are glad to find the name of Mr. Gore amongst this number, but regret that he was the only Shropshire member who supported Mr. Fielden on the occasion. The committee regret that the expectation embodied

in their report of last year, that the bill of Messrs. Howard and Read giving compensation for unexhausted improvements would be re-introduced in the last session, has not been fulfilled; whilst they consider it possible that a permissive bill may be introduced on the subject they regret to see no sign of the measure previously supported by this Chamber being brought forward.

Mr. STANLEY LEIGHTON said there was one remark he should like to make. There was a paragraph in the report which stated that the allowances from the Government for the police rate had been refused to this county. He wished to state that that was incorrect.

The CHAIRMAN: I think you are mistaken.

Mr. S. LEIGHTON: Then read it again, if you please.

The SECRETARY read the paragraph alluded to.

Mr. S. LEIGHTON said he thought it best not to mention it in the report, as the matter was still under consideration. If the grant was refused he thought it quite proper for the ratepayers to know of it, and consider the matter; but since it had not been refused he thought it unwise to mention it in a report of that sort.

The CHAIRMAN: Do you move the omission of the paragraph?

Mr. LEIGHTON: No, I merely notice it. It struck me it was unwise to introduce it since it is based upon incorrect information.

The Rev. E. WARTER: As one of the members of the Police Committee I beg to state that it is incorrect inasmuch as the report of Col. Cobbe is that he has no complaint to make of the police, excepting as to their inefficiency in point of numbers, which is a very different thing from the "inefficiency of the police force in the county," as will be understood from the report. It was on that ground only that Col. Cobbe stated that he could not see how he could make such a report as will get the grant for the county.

Mr. J. BATHER said he disagreed with all the report, and he wished to call the attention of the Chamber to what he considered to be a violation of the charter of the Chamber by such a report as that read having been issued, and by that Chamber being asked to sanction it. He did not think it was any part of the business of the committee to express all these "regrets" upon political subjects, over which members might hold different opinions. He did not believe the committee did "regret" when they said they did, his opinion being that what was alluded to were things thrown out for political purposes. Having read the rule under which the committee acted, Mr. Bather pointed out that its members were chosen from north and south, independent of their political views.

The committee met, he urged, to transact the business of the society, and, if in a private assembly, they expressed political opinions, and embodied them in their report, it was in strict violation of the rules of the Chamber. When they met for public discussion, he always advocated for others, as he claimed for himself, the greatest liberty of speech; but if the committee are to be permitted to sit privately, to discuss and to vote upon political matters, and if the opinion of those in the minority are to be compromised by those in the majority, he believed it would prove fatal to the Chamber. Let them look at the report. He was a member of the committee, and he was made to regret that only one of their members voted for the repeal of the Malt-tax. But he did not regret it! He was glad that £5,000,000 had not been thrown away, that their barley was still protected, and that they were getting a good price for it. He did not regret that there was a rumour that the police allowance was not to be paid by Government to the county. If the gentlemen who undertook to manage the affairs of the county were to be bribed to do what they thought was not right, or necessary, by the gift of public money, there would be an end of all public dealing, and he was glad that this county had set the example of holding up their hands against such a state of things and that they refused a small trumpery sum which they did not care about. He should not move that the report be sent back to the committee (for that would be a round-about way), but that as was sometimes said when a person signed a paper which he had not time to read—that it be received "errors excepted." He saw no harm in the report being received in that way, but he was strongly opposed to having his convictions compromised by its being adopted in the usual manner.

Mr. BOWEN JONES said it seemed to him important that the clause should appear. It had already been the means of eliciting more information upon the subject than the committee was aware of. Notwithstanding that, they had applied to the Clerk of the Peace for information. It seemed to him, after working for five or six years in the cause of local taxation, and having got a small modicum of relief from the present Government, in the shape of a greater allowance to the county police, it seemed very hard they should now sacrifice £4,000 or £5,000 in a single county. He was very glad the paragraph had appeared in the report, and he thought it was perfectly harmless, for it did not say that the allowance would not be paid, but that there was a rumour about it. If the money was not paid, the members of that chamber, being large rate-payers, would like to know why. He thought that it pointed plainly to the fact that county finance boards ought to be established; and he hoped a measure with that object would be brought forward next year.

Mr. BATHER asked the chairman whether, in his opinion, it formed any part of the duties of the committee to make such report.

The CHAIRMAN read from the rules what were the objects of the Chamber, and said he thought it was entirely within the province of the committee to make remarks upon political measures. He wished to say, in confirmation of his opinion, that in the report of last year those matters were discussed in the freest possible manner, and Mr. Bather was on the committee at the time.

The Rev. E. WARTER: I shall second Mr. Bather, simply on the ground of the one paragraph which Mr. Bowen Jones thinks is desirable, and which I look upon as a mis-statement.

Mr. BATHER called attention to rule number four, and asked the chairman if he held that the business of the committee was not limited to transacting business in the stricter sense of the word, but also to express opinions upon political matters.

The CHAIRMAN said he should be very sorry to set his opinion against that of former chairmen, and, as others had allowed it, he was not going to rule differently.

Mr. BATHER said till the question was raised it could not be decided. If the committee was considered justified in expressing an opinion upon all political subjects that came before them, and if the opinions of the minority were to be compromised in that way, all he could say was that never again would he sit upon a committee unless it was elected in a different way.

Mr. JONES: I should be sorry to support the paragraph. Mr. Warter and Mr. Leighton object to it if it can be shown to be a mis-statement.

The Rev. E. WARTER: It is not Colonel Cobb who grants, or who does not grant the money. He makes a report, and upon that report the Government will act, unless they see cause to alter their opinion, as I believe they will do in this case. Colonel Cobbe complains of inefficiency in point of numbers, which is a very different thing from what will be understood by the report.

Mr. JONES said he did not see that Mr. Warter had proved his assertion, for he admitted that there was inefficiency of some sort.

Mr. STANLEY LEIGHTON thought it was unwise for them to set about discussing rumours. He thought as large ratepayers they had a right to discuss all questions connected with the rates. But the question was, how far they were wise in getting hold of a rumour and acting upon it. He was speaking under correction, but he believed that Colonel Cobbe had no business to "advise" the Government; and yet in the report it was stated that the Government were advised. He should like to know who advised the Government. He could see what was the feeling of the Chamber with regard to the matter. It was this: "You are trying to prevent us discussing matters connected with the rates." He fully agreed that the members of that Chamber ought to discuss matters connected with the rates; the only question was whether they ought to discuss them before they had got something tangible before them. There were plenty of subjects for them to discuss, and plenty of things for them to lay hold of; and was it wise, before the time, to lay hold of a matter of that sort, and put it into the report? There was not a question connected either with agriculture or with the rates that he should not like to see discussed by them; but was the committee sure it was correct that the Government was "advised" to withdraw the grant? Certain private letters had, he knew, passed upon the subject, and who had given information in regard to them? Whoever had done so had been guilty of a sort of breach of confidence. Mr. Jones complained that the Clerk of the Peace had not laid the whole subject before them—

Mr. JONES: We did not know whether the correspondence was private or public, and, as a body of ratepayers, we applied to the Clerk of the Peace for information, and the answer we had was that he could not give it to us.

Mr. STANLEY LEIGHTON said, of course, the Clerk of the Peace could not; and he again urged that it would not be wise to insert the paragraph in the report.

The Rev. E. WARTER said if Mr. Jones would consent to insert the words "in point of numbers" after "inefficient," he should be satisfied. As it was, he looked upon the paragraph as a mis-statement. Whether magistrates or not magistrates, they were all anxious that they should have an efficient police force, and they were also anxious, if they could, to get the allowance from Government. Crime had of late diminished greatly in the county, and he should not like it to go forth that the police were inefficient in any respect but the one he had mentioned.

Mr. JONES said he had no objection to add the words Mr. Warter had suggested.

Mr. BATHER again urged that the report should be adopted, "errors excepted."

Mr. MINOR said he saw nothing political about the report.

Mr. BATHER: Do you not consider the repeal of the Malt-tax a political question?

Several Members: No, certainly not.

Mr. T. HORTON: I think if this Chamber is not to discuss political questions, the sooner it is dissolved the better.

Mr. HADDDING asked what they were to discuss if they were not to discuss such subjects as those in the report? He believed the duties of the committee to be to transact all the ordinary business of the Society, to draw up and present the report, and to call the attention of the Chamber to any agricultural questions which had arisen, or were likely to arise. He understood that the committee had to bring all such matters before the Chamber, otherwise how were things to be brought forward? As to the Malt-tax, he believed the Chamber had already come to a resolution in favour of its repeal or reduction. He regretted, and he thought they all regretted, that neither had been done—and yet it was urged that they had no right to mention it in their report.

Mr. BATHER said he proposed at the committee meeting that the subject be brought before the Chamber, but the word "regret" should not be put in. He simply wanted the attention of the Chamber to be called to it. The committee should

continue itself to reporting facts. No man who sat on the committee could say that he had ever wished to suppress facts: what he wished to suppress in the report were opinions.

Mr. HARDING said the Chamber would be asked to say whether or not it did regret that Mr. Gore was the only member who supported Mr. Fielding and the only one who had severed himself from his party for the good of his constituents. If those questions were not to be raised and if their members of the Chamber were not allowed to tell their representatives whether they were serving them rightly or wrongly, then the sooner the better they abolished the Chamber. As regarded the inefficiency of the police, if they were inefficient and so the county lost the Government grant he did not see that it mattered much what the cause of inefficiency was. If it simply arose from inefficiency of strength it was a lesser evil, but still it was inefficiency. He thought, however, that the addition of the words Mr. Warter suggested would meet the objection which had been raised.

Mr. J. R. O. GORE, M.P., said he should not have risen had not his name been so prominently brought forward; but he wished to explain the grounds upon which he had acted differently to the rest of the members of the county. When he was returned, one of the very few pledges he gave was that he would do all he could for the reduction or the repeal of the Malt-tax. He did not think the question was brought forward at the right time, and he urged Mr. Fielding not to press it unless he saw some better chance of success; but having given his word he supported Mr. Fielding. He should give the same vote again if the subject was brought forward, as he hoped it would be, and when it was, he hoped it would be more favourably received. Mr. Gore concluded by moving the adoption of the report with the addition of the words suggested by Mr. Warter.

Mr. C. C. COTES, M.P., seconded the proposition, and it was carried by a large majority.

Mr. MORE, the chairman, recollected once saying in that room that if they met in three years' time they would not, he believed, have got compensation for unexhausted improvements, and he still believed it was a very difficult thing to carry. He did not think there was any member in the present House of Commons that was likely to bring forward Sir Massey Lopes' bill. A gentleman who was once president of that Chamber, Mr. Tomline, had remarked that Chambers of Agriculture might do harm instead of good, because members attached too much importance to them, and paid too little attention to what was done in Parliament. He thought Chambers of Agriculture should take every opportunity of expressing their opinions upon political questions, meaning of course, agricultural political question, and not party political questions. He thought it was satisfactory to find that they had made some impressions upon the Government in regard to financial matters, and he was sorry to hear Mr. Bathur talk of the sums given by the Government as trumpery.

Mr. BATHUR said he meant trumpery when he compared it with the loss of honour.

Mr. MORE said he did not suppose that anyone expected that honour should be sacrificed for a bribe.

The CHAIRMAN said a communication had been received from the Central Chamber stating that the question of the maintenance of highways was shortly to be discussed.

Colonel CORBETT, M.P., proposed that it also form the subject of the next discussion of the Shropshire Chamber.

Mr. MANSELL: I should like to discuss how we are to keep our stock during the next winter. I think that would be a very proper subject.

KELSO FARMERS' CLUB.

AUTUMN MANURING.

At the usual monthly meeting, Mr. Wm. Purves, Linton Burnfoot, in the chair, the subject set down for discussion was "Should dung be applied to stubble or lea in autumn?"

Mr. GEORGE SHOLTO DOUGLAS, Kiddleton Hill, said: I have selected as the subject of our evening's discussion the disposal of farmyard manure in autumn. I think this is a question which we ought to study carefully, inasmuch as the cost of producing this manure is always on the increase—that is to say, cattle, straw, turnips, cake, and attendance cost more than they used to do, as it were, yesterday, and there is every probability that their price will not be diminished, but rather enhanced, by to-morrow. What is more proper, therefore, than that we should think of how we can obtain full value for this important product of the farm? I have not got the results of any experience to offer to you, as experiments, especially in agriculture, are tedious, costly, and often misleading. As regards the case in point, it would require experiments extending over many years, and carried on simultaneously at not a few different places, and under different conditions of soil and climate to convince me of the superiority of one system over another, and we must therefore look at the matter in the light of common sense if any such be afforded us. The manure I refer to is that made during the spring, at the conclusion of the feeding season, and which, by stress of time, or from being in too crude a state, cannot be applied to the turnip crop before sowing. This, being made when cattle are improving, or well advanced in condition, and during a season of the year best adapted for the purpose by reason of its dryness, ought to be the best that is produced on the farm. I say *ought to be*; and, indeed, when it is made in boxes or covered sheds it is the best. But, gentlemen, with the system of open courtyards that unfortunately prevails in this district, what is the state in which we find the dung after harvest, after it has got all the summer rain? As I was preparing of the paper which I now read to you, my people were cleaning out the cattle courts, and it was really lamentable to see such stuff. It was nothing but cold, wet, black, half-rotten straws, with, I fear, every particle of fertilising vigour wasted out of it. What a contrast is presented to that which the boxes yielded, the latter being hot, dry, and smoking like a furnace. This,

unfortunately forms only a small portion of what we have at our command. The question is therefore what to do with this stuff which we are pleased to call dung. When the summer work of the farm will not admit of anything being done towards preserving the contents of the yard in a good condition, and we have to remove them after harvest, the only thing is to take them to the land and cover them out of sight as soon as possible. It is the general practice to apply the manure to the stubble break that is intended for root crops in the following year, and, being spread, it is ploughed in and allowed to lie till the land is stirred preparatory to sowing. This is the quickest way of getting quit of it, but I am not sure it is put to the best use by such a method. We all know that it is a great point to get the stubble ploughed as dry as possible, and that being done, we reasonably expect to find it turn up in fine condition next spring. And, in order to insure this consummation, we plough into it a lot of wet straw. In exceptionally fine weather the manure may dry after being spread, but the humidity which generally prevails after October sets in prevents this. Further, it keeps hold of all the rain which falls; it cannot dry below the ground, and the soil cannot help, as it dries, drawing continual supplies of moisture from what acts as a sponge. Can it be wondered at that land which has been autumn dunged often turns up, especially if it be clayey, worse than that which has not been so treated? I have repeatedly seen it so, and the consequences are an increased application of artificial manure of the ammoniacal class, with their usual concomitants of over luxuriant straws and imperfectly grown bulbs. It is stated that manuring stubble tends to keep the ground open and allow the frost to obtain readier access to it. I cannot see the force of this argument, as the frost, if it does get below the surface, congeals the moisture it finds there, and, departing, leaves the ground as it was before, and the surface being disintegrated by the falls down and seals up the lower stratum more effectually than ever. Besides I have heard it stated in this room by gentlemen of undoubted authority that heavy land (which autumn manuring is supposed chiefly to benefit) is much better left untouched till the spring, and only lifted from the stubble before putting in the turnips. If this be the case then, a

fortiori, it does not profit to keep it open if ploughed, but rather to leave it as close as possible. If, on the other hand, dung be applied to lea, none of the objections I have stated can be urged against its use. It is not moister than the herbage with which the ground is covered, and so can do no harm by retaining wet. Containing a large proportion of silica, it is likely to promote the growth of straw in the corn crop. The undissolved portion which is not taken up by the corn is much better amalgamated with the soil, and therefore more likely to be serviceable to the turnips. We continually see, both in autumn and spring dunged land great masses of manure sticking above the surface and on the middle of the drills, yielding nourishment to nothing but weeds, and attracting flies and every species of abomination. All this would be avoided by manuring the lea. This method has another point in its favour. Most of us grow a few weeds among our corn, and a great many among our hay. The seeds of these get among the dung, and fermentation, often slight, does not kill them. Most of them will not germinate unless at a very small depth; and there is a greater chance of their being brought to the surface the second year after they are deposited, and this is more likely to be accomplished by the stirrings which the land so frequently receives in the manipulations to which the turnip crop is subjected. These remarks may also apply to the seed of any of them that may flourish among the corn. I am unable to state whether the different times of applying dung may have any influence on the development of these insects which harm us so much, but if any one could supply us with information on the point it might be turned to good account. When a crop of hay has been taken an application of dung is sure to prove very beneficial to land, as, besides the exhaustion which this crop is apt to induce, the stimulating manures which are often employed leave no fertilising effects, but rather the contrary. Nature abhors a vacuum, and fills up vacant space at her own discretion, and the best way to keep down such is to promote vigorous growth of useful plants. I might follow up the foregoing remarks by discussing the advisability of laying up all our dung, and applying it to the lea, but that would involve the consideration of subjects foreign to the matter in hand, and I would conclude by saying that it would be very profitable were the contents of the yards carted off during the summer as early as possible, and lay into a heap near the place where they are intended to be applied. In that case the manure could be laid on to the field and spread in frosty weather when there is nothing else doing.

Mr. USHER, Stodrig.—I must say that generally I approve very much of Mr. Douglas's suggestion, and I think he has taken a very scientific view of the subject. With regard to the laying on of dung in the spring of the year, although I highly approve of that system, still it must be borne in mind that the labour question enters greatly into this question. If we were to leave all our dung to be put on in the spring of the year it would involve a great deal of extra labour, and, I think, if we look at the great question of convenience, it is a great benefit to get the dung made in the spring of the year laid on in the backend of the year when we have not so much to do. I have no doubt that dung laid on to the drill generally speaking goes further. There is a great deal of waste in laying on dung in the backend of the year, and I also think it has the effect of wearing the land a good deal by carting it on in the backend and ploughing it wet in. But a great many of the members of the club have steep land, and if they did not lay it on in the backend they could not get it on at all. In addition to the extra labour it involves, it has the effect of levelling the drills and leaving the half of the dung on the surface. Looking at the subject from a practical point of view, the best plan is to lay on the dung we have made in the spring of the year the best way we possibly can, and to plough it in, and still leaves us with as much work as we can possibly overtake with the workers we have at our command.

Mr. HOWE, Haddon, stated the system adopted in Yorkshire and Lancashire, and concurred generally with what Mr. Douglas had said.

Mr. ROBERTSON, Ladyrig.—If I read this subject aright it is simply a question to be answered, viz., Should dung be applied to stubble or lea in autumn? Now that the question has been thoroughly put before me, I think it is a subject for very fair criticism. To answer the question, I should certainly say has a great deal to do with the solution of the point. If any of you were to ask me whether I would put the dung I make on to my lea or my stubble, I would answer that I

divide the thing. I would put a portion on my lea, and I would dung my stubble. There is one thing to which I would like to draw attention. I certainly think if we could throw back our crops a twelvemonth, or use something else for a year, we would profit greatly in after years. We would benefit both by the oats and the turnip crop, and, according to the quality, you could either give artificial dung or not; but you must bear in mind that you sacrifice the first year's manure.

Mr. USHER, Stodrig.—I am perfectly willing to take up what Mr. Robertson has said, and I do think that if we could manage to get a year in advance with the dung it would be a great advantage on a lea field. I think from the experience I have had there is one obstacle—we would be under the necessity of working entirely with extraneous manures, which very few farmers with plenty of dung would be inclined to do. From the experience I have had of laying dung on lea, it always had a very good effect on the oat crop. There is no doubt if you grow a strong crop of oats it has the effect of keeping down dirt and keeping the land cleaner. If you were to put extraneous manures on your turnip crop, there is no doubt that in the year succeeding the dunging you would have a better crop than you would have under other circumstances. If we were to adopt Mr. Douglas's principle of reducing the dung to a proper state before laying it on it would have this benefit: that we would be able to lay it on in frosty weather. But the labour question has to be considered, as it would involve a great deal of extra expense and extra labour.

Mr. ROBERTSON, Ladyrig.—I think, from what has fallen from the lips of Mr. Usher, that we must calculate what it costs to grow the crops. We must calculate that the labour market has risen 20 per cent. I think we should always keep in view what anything costs when introducing any change, and always keep in mind the price we have to pay for labour, as it is a very material question in the solution of any point as regards farming.

Mr. PURVES narrated his experience as regards the manuring of fields, and was of opinion that they should look at things as they generally stood, and not look a year before them.

A vote of thanks was passed to Mr. Douglas for his paper, and a similar compliment having been paid to Mr. Purves in the chair, the meeting separated.

THE HEXHAM FARMERS' CLUB.—The following subjects stand for discussion during the Session 1874 and 1875: Dec. 8th, Disintegration and Reconstruction—Mr. Spiers. Jan. 19th, the Exhaustion of the Soil of Great Britain—the President, Captain Nicholson. Feb. 16th, Ought Agricultural Politics be discussed by Farmers' Clubs, Mr. Newby Fraser. March 16th, Agricultural Measures before the House of Commons. April 13th, The Sheep of Scotland, and the Management of them—Mr. William Lyal, Caddonlee.

SALE OF MESSRS. M'COMBIE'S BLACK POLLED CATTLE.—This sale was held at Alford. Mr. McCombie, M.P., exhibited a lot of 46 animals in capital condition, and mostly bred by himself. His cows were very heavy, admirably fleshed, well-bred animals, and with one or two exceptions early calvers. They brought the good average of £45 15s., which is the highest on record for cows of the breed. This average, however, was surpassed by eight two-year-old heifers in calf, for they realised nearly £58 each. Ten yearling heifers averaged £35 a head. Four heifer-calves exceeded £23 each, and eight bulls sold fairly. The most handsome cow of the lot was Pride of Alford, the three-year-old which was first at Kelso as a yearling. Mr. Walker got her at 60 gs. The best of the two-year-old heifers was Ruth Second, which Mr. Barclay, Yonderton, took at 70gs. The best pedigreed two-year-old was Diana, half-sister to Lord Huntly's cup cow, which went rapidly up to 76 gs. for Lord Airlie. The best yearling heifer was Nugget; sold at 53 gs. The bull-calves did not sell so well as the female animals. Mr. McCombie, of Easter Skene, got a very fair sale for 17 animals drafted from his herd.

THE EAST LOTHIAN FARMERS' CLUB.

DISEASES IN ANIMALS.

At the first meeting for the season in Haddington, Mr. DOUGLAS (Athelstaneford), the Chairman, intimated that the subject set down for discussion was, What steps should be adopted to prevent the spread of disease in the transit of cattle and sheep?

This, he said, was a very serious subject, and the present Government were anxious to do something to prevent the spread of disease in animals, and were desirous to obtain reliable information. The prevention of disease in animals was not only a most important matter to the farmers but to the community in general. There would, no doubt, be more or less disease in this country so long as the transit of stock went on. There were many difficulties in the way of preventing disease in cattle conveyed by rail or in steamer, but he had no doubt remedial measures could be provided. Those parties in charge of stock moving about the country were desirous of attending as many markets as possible, and in order to do this sometimes they drove their stock at too great a speed, thereby overheating and exhausting the animals. Thus exhausted and heated, the animals had no heart to feed, and often lay down, contracting cold and producing disease. They could not avoid transferring stock from one country to another. From Ireland, for instance, a great many cattle were brought to this country for feeding purposes. In fact, the conveyance of cattle across the Irish Channel had become a considerable trade. The animals were packed up into steamboats not specially adapted for the purpose, and containing very imperfect accommodation. It might be worth while considering whether or not special boats should not be built for the purpose of conveying stock from Ireland, containing plenty of room, ventilation, and shelter. From that, no doubt, good results would flow. Very probably the cost of transit might be increased, but the better condition in which the animals would be disembarked would warrant the payment of higher charges. In these steamers the cattle were often huddled together in a very small space, and the excrements, specially the fluids, saturated the wood work on the deck so much that it was no wonder that disease was bred. He would have all decks and trucks for the conveyance of cattle thoroughly cleaned, and chloride of lime or any other disinfecting agents regularly applied. As steamers were kept just now cattle very often contracted disease, and then were sent all over the country before it made its appearance. Thus as to the conveyance of stock by rail, he thought cattle should not be sent more than 100 miles without water. A drink of good water was a most important thing the animals. It acted as food for the time being. If they got some such attention as that, the animals would go a long journey in much better form than they do presently when jammed together in trucks without either food or water for a journey of some hundred miles. Regarding the importation of cattle from abroad, there was a great danger of introducing disease in that way, but he did not wish to do anything calculated to spot the introduction of foreign cattle. No doubt it tended to reduce the prices of the home cattle by increasing the supplies, but still he did not complain of it on that account. Recently it had been said that those foreign cattle, as they were being sent mostly for beef, might be killed at the port of landing. But lately there had arisen a pretty extensive trade in dairy cows from Holland to this country. The animals were large, heavy, well-fleshed, superior milking cows, and they sold some of them at upwards of £30—a high price for a dairy cow. Some went to cow-feeders and some to farmers. Such animals as these could not be slaughtered without considerable sacrifice on landing, and he thought that provision should be made for a thorough examination as to their healthiness when they are embarked. This was quite as necessary as when they were disembarked. Some people think a quarantine should be instituted for foreign cattle. Many present would remember that some years ago a lot of condemned cattle were prevented from landing at Leith and the ship turned to sea, and the animals were thrown overboard. The carcasses were washed ashore here and there over a large portion of the coast. This was

most reprehensible conduct, and the Local Authorities should do everything in their power to prevent a repetition of such a thing. He thought people should not complain of the pressure of Privy Council enactments, so long as the measures were taken with the great end in view of lessening the spread of the disease throughout the country. At this moment that awful scourge the rinderpest was raging in the steppes of Russia, and with the foreign traffic going on it might be brought to this country. If such were unfortunately the case it would decimate their herds, and be a very sad thing for the country, making them pay dear for the freedom of importation, and telling on the food supplies for many years to come. He believed the hands of the Government would be strengthened if farmers' clubs throughout the country seriously considered the subject, and offered suggestions founded on the experience of the various members. The chairman here stated that he learned from a private letter received by one of the members of the club from Mr. Barclay, M.P. for Forfarshire, that a deputation of the local authorities in the northern counties was being organised to wait upon the Duke of Richmond, President of the Council, on the subject, about the middle of this month. He was of opinion that this club should do what it could to co-operate with their brethren in the north in this movement. In reference to the treatment of disease after it had appeared, the farmers found considerable difficulty in carrying out the system of isolation. Farm buildings now-a-days were, for economic purposes, so closely joined together that the means afforded for separation of diseased animals were insufficient. If some sanitary arrangement were established by which the animals affected by disease could be isolated, it would be a great matter. For instance, if a farmer went to the market and bought a horse, he found perhaps after the animal came home that it had got cold or disease, and as the farmer had no means to separate it from the rest of the horses, the infection soon spread over the whole of the stable. In some counties the amount of compensation paid to owners of animals slaughtered, by order of the local authority, was one-half of the value, in others two-thirds, and in some even three-fourths. If farmers and farmers' clubs throughout the country ventilated the matter properly, and gave advice and a helping hand to the Government, he believed something might be done.

Mr. PATON (Standingstone) said it will not for a moment be disputed that the subject before the Club to-night is of the utmost importance, not only to the British farmer, but to every British subject. It would have been not only interesting, but most satisfactory, to have had statistics of the number and value of animals carried annually in Britain by rail, as well as of those imported from Ireland and the Continent. This could have been done so far, with time and a good deal of hunting up, but for practical purposes they can be done without. It is well known that the capital involved in live stock is something enormous, and yet the cattle trade is conducted in a most reckless and haphazard manner in many cases. The subject naturally divides itself into two—viz., transit by rail and transit by sea. As to the first we have heard a great deal lately about animals being so many hours on rail without water, and various sorts of trucks have been constructed and brought before the public with water troughs and other appliances for the comfort of the cattle. That is all very well meant, and it is quite possible to fill these troughs at different stations, but the practical difficulty is great. Suppose a train of thirty or forty wagons filled with cattle starting from the next Falkirk trust, and allowing that the troughs were all filled when the cattle were put in, and suppose that the cattle had stood on the moor all day, the water in the troughs would very soon disappear, even before they got started. Then, suppose that the said cattle were to be in these trucks for 36 hours, or even longer, no doubt water would be a very excellent thing for them during that time, but where are the men to be got to supply it, even were every convenience at the stations. They might pretend to do it, but it would not be done, a great deal of time would be lost and expenses incurred. It seems to me that instead of stop-

ping and attempting to water, either by turning the animals out or running the water into the troughs, the much better plan is to hurry them to their destination, and see that they are not allowed to stand at side stations for hours as is some times done. But a very simple and easily-managed affair is the washing out the trucks with hot lime each time they are used. Were this always done there would be decidedly less disease in the country. We believe that the railway officials do their best to have it done, as a rule, but it is often not done both for want of time and the material to do it with. Were stock owners to take the trouble of giving notice to the station officials that trucks properly cleansed would be required at a certain hour the following day, then if it turned out that from neglect these trucks had not been cleansed, and that the stock being forward had to be put in as they were, in such a case the company ought to be sharply dealt with. It seems, then, that practically in transit by rail the proper cleansing of the trucks is about the most that can be done to prevent the spread of disease. In the transit by sea, however, more especially from Ireland and the Continent, many difficulties arise. It is a well-known fact that before Irish cattle were so plentiful in Scotland, pleuro-pneumonia was unknown, and that until we had cattle from the Continent rinderpest was only seen in print. But we must take things as we find them and make the best of them. We would perhaps like to be able to do without Irish and foreign cattle, but we can't. It is admitted that Irish cattle with us are much more liable to take pleuro than English are. Looking at the two, one would readily conclude that the Irish would be the more hardy; but the reason for the opposite is not far to seek. It is natural to suppose that the Irish farmer or dealer will not send to Britain any animals that he supposes have pleuro. We believe, as a rule, they are sound before entering the steamboats that ply between the two countries, but there the fatal seeds are sown that often bear fruits months hence. How can it be otherwise? Here are a lot of animals stowed away for hours in a space not sufficient for half the number, and with bad ventilation in many cases. In a short time the temperature is something intolerable. By the time the animals arrive at port and appear on the quay, they look as if they had just come out of a very dirty vapour bath, with their sides reeking, and so besmeared with dirt that it is often impossible to tell the original colour. Driven from this, perhaps to lie the night, or even nights, on the bare stones, with the elements in all their wrath above, is it to be wondered that cases of pleuro are not even of more frequent occurrence than they really are? Of course, it is the interest of owners of steamers to put as many animals on board as possible. I thoroughly believe that those steamers are the regular hotbeds of disease, and that Government could not do a wiser thing, not only for the farmer, but for the nation, than to compel companies to have vessels constructed on the most approved principles for the transit of Irish cattle, and having a certain amount of accommodation and space for each animal. It would be also greatly to the advantage of the Irish store farmer were such arrangements made, as farmers here would buy with much greater confidence than they do at present. Then, as to the foreign trade: the animals until lately were for the most part fat; now, however, we have large numbers of dairy cows, as well as a few stores now and again, but the latter do not take the market well, and until a better class of stock can be sent we are not likely to have many of this sort. Government has all along been doing a good deal at the ports where foreign cattle are landed to keep down disease. They have a staff of officials to inspect the cattle when landed, but that inspection often amounts to very little. It is impossible to say at a glance whether an animal is affected or not. Is it not also possible, very likely probable, that in not a few cases the inspectors may be on very friendly terms with the importers, and give them too often the benefit of the doubt? This is too often, I understand, the case. The only remedy is slaughter on landing. Butchers sometimes make a noise at the restrictions imposed, but that is only one class of the community, and surely if the best beef that goes to London is slaughtered at Aberdeen and sent in carcase, there can be no reason why the foreign cattle might not be killed in Leith and sent to Edinburgh. It is strange, however, that the idea prevails almost amongst every class that such restrictions are entirely for the benefit of the farmer and proprietor, the public never for a moment thinking that if there were no disease amongst cattle, beef

would be very much cheaper. Another thing I would like to mention here is the insane practice of holding the store markets on the same ground and on the same day as fat markets. This ought to be stopped by Government. Perhaps a little more trouble would be caused at first, but that would soon be got over. Then, again, although not immediately connected with the transit of cattle, still quite as important is the question—What is to be done with cattle after they are affected? It is very hard that a farmer should be compelled to kill his cattle and not be paid a considerable proportion of their value, and yet stamping out in the case of pleuro or rinderpest seems to be the only means to get clear of it. Were Government to come forward and offer, say, three-fourths the value of the animals, farmers, as a rule, would give information at once—otherwise, many would take the chance of running the blockade, and disposing of many of their animals as possible rather than give information of their having disease about their place. I understand that at present Government has several agents scouring the country gathering all the information they can as to the cattle trade and traffic, and it is only by hints from practical men that any good will arise from it. They are anxious to get information, and I think that it is only the duty of farmers to express their several opinions, however crude they may be.

Mr. SMITH Stevenson (Mains) thought this subject of the very greatest importance, not only to the farmers but to the community at large. The prevention of the spread of disease amongst cattle must interest the whole nation. Not very long ago a number of butchers in London and other large English towns waited, if he was not mistaken, on the Government, or petitioned for the admission of foreign animals into this country without almost any restrictions. He believed those gentlemen were actuated by a desire to have cheap meat. He could not forget that the agricultural interest and the interest of the whole community were the same on this subject, although it seemed very difficult for the latter to think so. He held that they were the same for this reason, that if foreign cattle were admitted freely and unrestrictedly it might cheapen meat for a time, but he had no doubt it would tend to raise it in the long run, for if they brought in disease into this country and spread it among the cattle the tendency would be to raise the price of meat rather than otherwise. He thought the public were quite entitled to do what in them lay to have a good supply of meat at the cheapest price. It was for the agricultural interest to endeavour to produce as much as possible. The farmer would be better producing a larger quantity even at a lower price, than raising a small supply for a high price. And this was certainly the consumer's interest also. He quite agreed with Mr. Paton in regard to the restrictions on foreign cattle. The rules and regulations for the transit of cattle by rail in this country were pretty good, but unfortunately they were very seldom enforced. The cleansing and disinfecting of railway trucks was carried out perhaps at the largest stations, but at many of the smaller stations it was very seldom done. In regard to the importation of foreign fat cattle, he was of opinion that they should be slaughtered at the port of debarkation, and that store animals coming from abroad should be put in quarantine. It was of special interest to the Scotch farmer to have a cheap and good supply of store cattle, because he believed for one farmer that bred his own stores in Scotland three or four had to buy feeding beasts, but he did not think there would be any great hardship, and certainly there would be advantage to the public to have all fat cattle slaughtered at the port of landing. The carcasses could then be sent safely over the country, and no risk would be run of spreading the disease among the livestock. He was clearly of opinion that there should be separate markets or fairs for fat stock and store animals. The amalgamation of the fat and the store markets just now was the means of spreading a good deal of the disease in the country. It was a great mistake to throw condemned carcasses into the sea. They should be sent to the chemical manure works, where they would be disinfected thoroughly and made into manure instead of being washed along their shores.

Mr. WYLLIE BOLTON: Will an animal drowned in salt water infect anything?

Mr. SMITH: Well, I would not like to risk it.

Mr. DUNN (Baracmains) thought the proper thing would be for the Government to ascertain what diseases were really infectious. For instance, he scarcely thought that pleuro

was infectious (several voices, "Oh! oh!"). Mr. Durie repeated that he did not think it was infectious, and there certainly was nothing said to convince him that it was. It spread, to be sure, but in his experience only among the animals that were submitted to the same atmospheric influences as those first affected. Murrain and sheep-scab were infectious. Scab was brought on by over-heating and over-driving the flocks to or from the market, and unless there could be some more restrictions on the mode of driving, which he was afraid was impossible, he did not see any effectual way out of the difficulties, so far as sheep-scab was concerned. The best preventive he knew of for pleuro was to get cattle conveyed by the steamers well protected from cold and wet on board. He was afraid that would be rather expensive for the importers, but he saw no other way of lessening the spread of pleuro than avoiding the alternate heats and colds in transit. If cattle got infected with foot-and-mouth disease, the best thing to do was to avoid driving them. Exertion irritated the disease greatly, and it would be much sooner got over if the animals were allowed to rest whenever it was observed.

Mr. HARVEY (Whittinghame Mains) alluded to the various modes in which the different local authorities throughout the country carried out the provisions in the Privy Council orders. They had, he said, the Local Authorities of East Lothian, Roxburgh, Selkirk, Mid-Lothian, and others all working more or less differently. Whatever regulations were made should be enforced, so that in the working one county should be consonant with another. As regards the importation of cattle from Ireland, he thought there should be a special staff of inspectors appointed to examine the stock on the steamers and at ports. He did not think that those local veterinary inspectors in different parts of the country were sufficient, for they all knew there was such a thing as "tip" in this country. If something like uniformity of action in the various counties were rendered imperative many of the present practical difficulties would be got over. They should have some highly qualified man or men, responsible to Government, appointed for the purpose of visiting such ports as Hull, Leith, and Yarmouth, and going over the country seeing that those local inspectors did their duty. Then as to scab in sheep, it might be materially lessened if they had uniformity of action, instead of every local board working out as at present its own small problems.

Mr. SHIRREFF (Saltcoats) thought it was the duty of every practical man to give his experience to aid the scientific on such an important subject as this. It was admitted on all hands that stock were very apt to contract disease in transit, and the question was how to check or prevent the disease. Some years ago, when in England, he bought a lot of superior pigs in Wiltshire, and took them to East Lothian. They were taken down by steamer; they had a good voyage, got safely to their destination, and did so well in the county that some friends requested him to get more of them. Accordingly he obtained other two "litters" from the same party and place. They had a stormy voyage, but arrived seemingly all right. But in the course of a week or so the second arrival of pigs not only took disease and died, but infected all the other pigs which had come in contact with them. They had a perfectly clean bill of health when they started, and he had not the slightest doubt disease had been caught on the voyage. The cause of such an outbreak, as he had mentioned, was a highly scientific question. Instead of putting store animals into quarantine, and keeping them there for some weeks, where, exposed as they might be, disease might be brought on, he would have them taken at once home to warm, comfortable quarters.

Mr. ROBERTSON (New Mains) said nobody could deny that there were great grievances and risks connected with the present system of stock transit. It was of great importance that every endeavour should be made to travel the stock with as much comfort as possible. When the animals were exhausted in transit, they were much more liable to contract disease. Stock in transit should be dealt with in a very different manner from what they were at present. He complained strongly of the shameful usage the dumb animals underwent at markets and fairs from those individuals—he could scarcely call them men—who equipped themselves with sharp-pointed sticks and rods. He thought local authorities should take cognisance of the usage the animals sustained at the hands of drovers, &c. They were all aware that this country could not be supplied without importations. It would be a great

boon if Government would make some such regulations as would ensure the safer and speedier transit of animals from Ireland. The Government should have vessels specially constructed for the Irish cattle traffic. He was sure that two such vessels would cope with the whole trade. The vessels should be built and fitted up in such a manner that there would be no danger to stock on the voyage. With such a short passage, he did not see that it should be difficult for the Government to make provision for the shipping of cattle from Ireland to this country in perfect safety. The present mode of conveying stock by rail in this country was also in many respects unsatisfactory. He had known of cattle being twenty hours in trucks, in their own district, accomplishing a journey of as many miles. That was simply ridiculous. It was too bad that the railway companies should have it in their power to deal thus recklessly with the valuable stock of the farmer, representing a great deal of money. The railway people turned out the cattle alive, so that the farmer had no hold of them; but the beasts were often constitutionally injured, and did not thrive. That meant a great loss to the farmer. These were matters which should be impressed on the Government. With reference to the foreign cattle trade, he coincided with much that had been already well said. Their experience was that the more dangerous epidemics that swept across the country came from abroad. He would have all fat stock from foreign countries slaughtered at the port of debarkation. The carcases could be sent to the market as well dead as alive, and with much more safety to the country. In reference to the importation of store cattle, certain spots at ports could be marked out, with a cordon thrown around, and the animals kept there until they were perfectly purified.

Mr. CHARLES SMITH (Whittinghame) proposed the following resolution, which was seconded by Mr. ROBERTSON (New Mains), and unanimously agreed to: "That this club, recognising the importance of Imperial measures for preventing the spread of infectious disease among cattle and sheep, approve of the Privy Council continuing and extending their regulations throughout the country, and agree that Lord Elcho should be respectfully requested to forward to the Duke of Richmond a copy of this resolution, pressing the subject on his attention."

SHEEP SCAB.—At the Police Court, Sherborne, Mr. J. Day, of Lillesdon Court, was summoned for having in his possession certain sheep affected with a contagious disease, and neglecting to give notice to a police-constable with all practicable speed, contrary to an order in Council. Evidence was given by Mr. J. Gibbs, one of the veterinary inspectors appointed by the Court of Quarter Session, to show that the major part of defendant's flock of 500 sheep were very badly affected with scab, and that the outbreak must have been of some months' standing. Ten of the sheep had been minutely examined, and found to be suffering in an advanced stage of the disease, and the Bench convicted for those ten, mitigating the penalty from £50 to £20, including costs. The proceedings were instituted by Superintendent Goldsmith, inspector under the Act, and it was proved that defendant allowed the sheep to mingle and to stray on the highway.

POTATO PROFESSORS.—As for the fertility of the fancy in discovering explanations of potato-disease, it is really a matter demanding the instant attention of psychologists, for it is evidence of wide-spread stupidity or insanity or vanity, or something equally dreadful, that should be cured by the Social Science Congress. The past season has been characterised by continuous sunshine, and potato-disease was unheard of until the sunshine failed, and then the crops still in the ground became more or less diseased. There is no mystery about the potato-disease: it is a question of sunshine from first to last, and if Mr. Torbitt is resolved to eradicate it, he must go to the sun and abolish his spots, and make such other arrangements as shall ensure to this globe uniform and favourable cosmical influences. A wet cold summer makes potato-disease, a hot dry summer makes a healthy crop of potatoes. The facts are patent, and yet there is a crowd of clamorous people always ready with some nonsensical and injurious fancy to explain the cause and cure of the murrain that decimates the noble root.—*The Gardener's Magazine.*

LABOURERS' UNIONS IN THE WEST.

Sir T. D. Acland has placed a room at Broadclyst at the disposal of those who are organising Union meetings, and at the same time addressed the following letter to Mr. S. Mitchell :

Holnicote, Oct. 10, 1874.

SIR,—I thank you for your courteous letter, and for sending me your list of the necessary weekly expenses of a Somersetshire farm labourer, which you estimate at 21s., and also your notice to the farm labourers of the large meetings to be held in their favour in the West of England, and to be followed by collections for the support of the local delegates. I willingly believe that you are not acting from any selfish motive, and that you desire to awaken sympathy for a class from which I gather that you have risen yourself by hard striving. I am not aware of the reasons which have led to the selection of Broadclyst as the only agricultural village in Devonshire at which a meeting is to be held. You will find in that parish owners and occupiers of land of every grade, some of whose families have risen by honourable efforts like your own, and about 300 labourers, most of whom have good gardens with their cottages, and allotments besides. Some few are keeping cows or dairies—the first upward step on the ladder. I wish there were more. The money rate of weekly wages, as compared with that of some other parts of England, is affected by two circumstances—1, the hours of daywork are shorter; 2, the majority of the labourers persist in demanding nearly one-sixth of their earnings in the form of liquor for themselves instead of money for the whole family. Some men receive 15s. per week in money regularly; others earn on an average 16s. or 17s. for piece-work. I think it unreasonable to set in contrast with these wages a rate of money payment equal to, if not higher than, that paid in towns to labourers who have no gardens and no cheap fuel, and who pay much higher rents for inferior house accommodation. Two carters (one unmarried) left Broadclyst last spring for wages at 24s. in Wales. They found it did not answer, and came back after a few weeks' trial. You do me the justice to believe that I desire to discover what is the best way to get our labourers better fed and better housed. I am well aware that there is great need for improvement—more, however, in some places than in others. I will say nothing of the progress which has been going on for the last half-century; of the

amount of money, time, and attention which many landowners and their agents are devoting to these questions. Nor will I dwell on the difficulties more or less connected with the rapid growth of wealth in trade, the rise in prices in building, the need of more capital for the improvement of land, the narrow margin of profit, the increase of population, the deficiency, or more often the neglect, of the means of education, the working of the Poor-law and of the laws affecting the tenure of land. The influence of each of these circumstances on the condition of the labourer should neither be overlooked nor exaggerated. They suggest matter for reflection and patient effort, not for sluggish acquiescence in the things as they are nor for delusive expectation of sudden changes for the better. But I must say that I think it unjust that one class—namely, the practical farmers—should be singled out, as they have been by the advocates of the Labourers' Union, for obloquy on account of evils beyond their control, or because they do not offer wages in excess of the demand, and beyond the market value of the work done. Nor do I think that torch-light meetings, stimulated by handbills such as you sent me a specimen of, at the head of which are representations of labourers as ghastly skeletons, and caricatures of well-fed farmers, will be favourable to the detailed discussion of the means of improvement to which you invite me. Still if you and those with whom you are acting believe that public meetings will arouse the labourers to combined exertion for their own good, and persuade them to cultivate self-reliance, providence, and temperance, objects for which I am glad to welcome the support of the Union, or if you hope to hasten the progressive reform of laws unfavourable to the condition of the labourer, as far as I am concerned you shall have every facility for making your appeal without hindrance. I have great confidence in the good sense of my neighbours, and in the mutual good feeling of masters and men. I believe they will listen to what you have to say and form a reasonable estimate of the value of your statements. Whether the Union will make more rapid progress in Broadclyst or in Devonshire than it has hitherto made, remains to be seen; at any rate it has not been stimulated by organised opposition.

I am, sir, yours faithfully,

T. D. ACLAND.

Mr. G. Mitchell, "Onc from the Plough."

N O R T H A M P T O N T O W I T.

TO THE EDITOR OF THE NORTHAMPTON HERALD.

Appeal if you will,
You're sold if you do;
Its settled and fixed
Without asking you.

SIR,—Such was the tone and spirit of a mandate which, dated September 15, 1874, issued shortly afterwards from the office of the Clerk of the Peace for the county of Northampton. It was addressed by "The Committee of Justices appointed to revise the basis of the rate now in force for this county" to "The overseers of the poor" of each parish. No Russian ukase was ever more arbitrary; no Delphian oracle ever more obscure.

This circular merely informed the overseers that the committee had, "after due inquiry and investigation by them, thought fit to alter such basis, and they propose to alter your rate, by increasing (or 'decreasing,' as the case might be, but much, most generally the former) the same from £ to £."

In the case of this parish it was an increase of £331—namely, "from £2,926 to £3,257." We cannot understand the cause of this increase.

Tuesday, the 29th of Sept., was named as the day of appeal, and it was requested that a previous notice of the intention to appeal might be given.

Fourteen days only were allowed for the clerk to issue the notice, for the overseers to receive it, for them to call the rate-payers together in vestry, for the rate-payers to deliberate and determine, for previous notice of appeal to be given, and for the representative of the parish to attend the meeting of the committee, and object to the rate.

Not only was no information given with regard to any details or reasons for the proposed increase, but the basis itself of the proposed rate was studiously concealed. It was only after a further portion of this miserable modicum of 14 days had been consumed in writing to the Clerk of the Peace to inquire, that the ratepayers of Hellingdon ascertained that the basis taken was the Income-tax Returns: on every other point they remained as ignorant as before. It was evident that the ratepayers of Northamptonshire had been purposely pinned into a corner, that they were the victims of a foregone conclusion, and that the *ex post facto* appeal which they were offered was only a sham and a blind to save appearances.

Appeal indeed! against what? Against a rate of which they knew only the increased sum total, but of the principles on which it was made they had been kept altogether in ignorance. They could form no opinion whatever on the fairness or unfairness, as applied to themselves, of this intended rate. It was never intended they should; no appeals were desired but such as might easily be quashed.

This notice fell upon the rural ratepayers of Northamptonshire like a thunder-clap. They could scarcely believe that a notoriously effete and exploded tax, characterised by every species of unfairness in its collection, a mere makeshift at first, by public opinion universally condemned, except as a mere war-tax, since, rough and barbarous in its construction, partial and unfair in its operation, a tax which it is to be presumed and hoped will soon die a natural death—that such a tax as this was to be made the basis on which a great part of their local rates, already too oppressive, were to be raised, increased, and made more oppressive still.

Many as have been the valid objections which have been made against the Income-tax on the ground of its unfairness, scarcely one is more felt anywhere than the system under which the tax is levied in the rural districts—by returns of rental. The actual value of the land is not the point on which stress is laid, as it should be, but the sole question is "What rent it pays?" The return of that is what the Income-tax requires, and the amount paid on any particular farm is therefore regulated by the whim and caprice of the landlord. It is less or more according to whether he happens to be liberal or a screw. Such is the debased basis on which the Committee of Justices propose to rate us for the future. Woe to the parishes which have avaricious landlords; their payments will be sensibly increased.

And it is to be feared that this is not the only evil. Though the rate is assessed upon the parish as a whole, according to its payments to the Income-tax, most of the rural ratepayers believe that a different basis must be adopted in rating the individual parishioner. The rate must in the parish itself be raised as now by an assessment based upon the actual value of the property each man occupies, and not upon the rent he pays. They believe this for an obvious reason. The returns of rental are and must be *secret*—the parish officers have no access to them. Their only basis for rating the parishioners *inter se* must be actual value. If their belief is not true, what a pity it is that the committee did not condescend to enlighten, by a little more openness, their rustic ignorance! But if their belief is correct, in what a slough of despond have the committee sunk us, adopting for the purpose of raising a rate two utterly opposite systems based on conflicting principles—one for the parish as a whole, the other for the ratepayer in particular! They have flung the sum total at our heads, and left us to raise it any how we can. Was there ever such needless complication?

And how palpably unfair! Lord — has two farms in some particular parish. His agent comes down and raises the rents of them 30 per cent. The Income-tax returns of the parish are raised too, and the parish rate is, according to the basis the committee has taken, raised too. The increased payment is made, not from those two farms alone, but by the overseer levying a part of it from every ratepayer in the parish in proportion to the sum at which he is locally assessed, though neither his rent nor the actual value of his occupation has been in the slightest degree altered.

Such were the opinions which made the ratepayers of Hellidon, in vestry assembled, request me to attend as their representative at Northampton, on Sept. 29th, the day of appeal. I declined to do so, for the reasons above mentioned; because the notice itself discouraged such an appeal, and showed that it would be a farce in the face of a foregone conclusion. With this opinion the vestry generally agreed. But though Hellidon did not appeal, other parishes did. A noble band, representatives of fifty parishes, undertook the hopeless task, and so staggered the committee that even the noble chairman (Earl Spencer) himself confessed to them that at first he had himself disapproved the basis which had been now agreed upon. But the issue was as I expected. It was impossible on such a point as the basis on which the county rate should be levied to take the opinion of rustic ratepayers. Lord Henley twitted them with being "too late." "Too late," indeed! Whose fault was that? Surely the fault of an overbearing committee, which, acting on the *sic volo, sic jubeo* principle, kept its intentions studiously concealed from those principally interested till it had made them "too late." His lordship also told these good men and true, that they represented fifty parishes only, and that the committee might assume that the other 250, which had not appealed, were in their favour. A sophistical argument, of the fallacy of which this letter is a proof.

To these fifty men who volunteered to act as a "forlorn

hope" and to mount the breach first, the ratepayers of Northamptonshire return their grateful thanks. They passed unanimously, with two exceptions, a resolution condemnatory of the Income-tax returns as a basis for the county rate. We can only regret that they did not lead us one step further, by taking a leaf out of the book of their Cambridgeshire brothers, and asking us to assist them in forming what is so much needed, now that the farmers are attacked both from above and from below—A FARMERS' DEFENCE ASSOCIATION. We should not be slow in responding to their invitation.

Though we have not appealed, we can still protest; and we do most heartily protest against this unfair, secret, and arbitrary system of county legislation; we utterly repudiate the very Irish conclusions of the casuistical Irish peer, and we demand, as Englishmen, to be heard in our own defence.

Two great facts we should learn from this one-sided business—that there should be no taxation without representation; and that we should fight as shy as possible of all Government returns. When tradesmen return their sales of cotton and of calico, or their hogheads of sugar and chests of tea, it will be time enough for the farmers to return their corn, their beeves, their muttons, and their hogs. Remember, it was said the Income-tax returns were only made for one particular purpose, that they were secret and inviolable, and could never be injurious to those who made them. We have now plain proof to the contrary.

Yours, obediently,
JOHN STORER.

Hellidon, Oct. 8, 1874.

SHOW ROOTS.—Specimen roots must be evidences of what may be done by liberal skillful *farming*, not the results of *nursing*. The following are some of the methods of cultivating "specimen roots." (1) Holes dug in the earth are filled with compost; the plants, raised in flower-pots, are placed in them at a distance of a yard apart; these pots receive great attention throughout the summer—the result is "Magnificent agricultural (?) roots." (2) A few perches of suitable land are selected (very often newly-broken-up old pasture); this plot of ground receives *nursery* treatment, and the plants are allowed a space not compatible on a large scale, even in farming of the highest order—roots thus cultivated are exhibited as specimens of what? (3) A strip in a field is chosen, a few ridges receive a greatly-increased quantity of farmyard manure, extra artificial is used, and the plants on these selected ridges are "set out" at a much greater distance than the rest of the field; liquid manure is sometimes supplied to them during the period of growth, and roots "for competition" are taken from these *pampered* specimens of what? (4) Roots culled from the root-quarters of two or three farms and shown by one exhibitor as specimens of what? By these modes of procedure the *farmer*, who draws his roots for exhibition from a business-like area, finds himself outdone; deceptions are practised upon the public; that tallacious assertion, which the disturbers of the peace of the present day are so fond of making—viz., that small holdings produce more food for man and beast than large ones, is supported; those who have a "peep behind the scenes" are disgusted; and those who receive prizes for roots so cultivated and shown as specimens of agricultural roots obtain those prizes under false pretences. The foregoing observations apply to root shows in general, not to any particular show.—*The Oxford Journal*.

THE FARMERS' ASSOCIATION SWINDLE.—At the Warwickshire Quarter Sessions, a person styling himself Dr. James Philips was convicted of obtaining several subscriptions to the sham National Farmers' Association from Warwickshire agriculturists. It was shown that taking advantage of the differences between farmers and labourers the prisoner issued prospectuses of a National Farmers' Association to counteract the National Agricultural Labourers' Union. He had for the last eighteen months been thus engaged collecting subscriptions in Wiltshire, Oxfordshire, Berkshire, Warwickshire, and other counties, and amongst the alleged supporters were Lord Walsingham, Mr. C. S. Reed, and other well-known agriculturists. A previous conviction at Devizes was proved against the prisoner, who was now sentenced to twelve months' imprisonment.

STOCK AND SHEEP SALES.

SALE OF MR. J. B. GREEN'S HEREFORD HERD.

AT GWERNAFFEL, KNIGHTON, ON SEPT. 25.

BY MR. W. G. PREECE.

"A man who had come over from Australia gave as his experience that three Hereford cattle would thrive where two Shorthorns would starve, and that for breeding in his rough country they were far preferable to Shorthorns. Seeing that the Australian colonies would be now open again for the importation of foreign stock, after being closed for two years on account of the disease, it might, under these circumstances, be safely concluded that the white-faces and beautiful countenances of our Hereford cattle would soon be seen covering the Australian pastures to feed the million." So said Sir Joseph Bailey at Leominster the other day; while an angler on the Wharfe by Bolton Abbey, in Yorkshire, has just told us through *The Gentleman's Magazine* how "a fine herd of Herefords, the most effective of all cattle as component parts of a landscape, contentedly lie under the trees or crop the succulent herbage." Again, a Hereford ox was in the opinion of many the best beast in Bingley Hall last Christmas-time; as the breed has now been put further on its trial by the sale of one of the best herds in the kingdom. During a long career, Mr. Joseph Green, of Marlow, has carefully cultivated the Hereford cattle; and, although he has declined to exhibit, his stock has for many years been known by other breeders as of the best blood and finest character. For either home use or exportation the Gwernaffels have always commanded good prices, and their dispersion is now only consequent on their owner giving up his occupation by Knighton.

As the lots will show, the herd is full of "good breeding." Renown, the bull used chiefly for some seasons, is a son of Severn, while he has since been backed by the twin Zealons; as further will be found in the pedigrees the names of such bulls as Walford, Battenhall, and Tom King, from old Governess; as, in fact, bachelor though he be, Mr. Green was considered to have the handsomest Governess in the country in his family, and her head has been thus cited as a model:

Length of face	21½ inches.
Between eyes	12 "
Round nose	25 "
Length of horns	20 "
Width of horns, from tip to tip.....	37½ "

Governess, however, was, as times go, on a large scale, and Mr. Green's Herefords pretty generally more weighty and wealthy than those we often see in the ring. Indeed, the Gwernaffel herd owes much to this good lady. Originally established at Marlow, near Leintwardine, where Mr. Green lives, in 1843 and '44, by selections of some of the oldest and best stock in the country, the Herefords were shifted to Knighton some fifteen or sixteen years since. Here they soon received a very useful addition by the purchase of Governess, an aged cow from the stock of the late Mr. Jeffries, possessing great constitution, as was proved by her living and breeding up to the age of 26. This same strength of constitution was an especially valuable property at such a place as Gwernaffel, which is a high cold farm, where, previous to Mr. Green entering on it, the stock maintained ran to nine or ten cows and a flock of some hundred and thirty long-tailed Welsh ewes. Governess was sent to Sir Benjamin, and the produce the twin bulls Zeal and Zealous. Zeal, of

little use, was soon sent on to the butcher; but Zealous proved himself a grand stock-getter, and is still at thirteen years old doing good service; thus inheriting his dam's fine properties. The heifers and younger stock are chiefly by Renown, a bull bred by Lord Berwick, and purchased of Mr. George Smythies. Renown has also been another marked success, his stock being very hardy and great flesh-carriers, if the cows are better than the bulls; much liked nevertheless as they are by those who have used them. Nearly all the herd has been bred up to one certain standard by Mr. Green himself; but Jessie and Countess were bought last autumn at Mr. Gibbons' sale for the purpose of introducing a little fresh blood, and the heifer Adelaide 2nd, bred by Her Majesty, was a purchase at the Royal Cardiff Show in 1872; but so far she has proved barren.

Without seeming to care about it, as certainly in a very quiet way, Mr. Green has achieved a deservedly high reputation not only as a breeder, but as a farmer; as his practice has been alike a benefit to his landlord and to the country, and an example to his brother-agriculturists. The land has greatly increased in value as it produce during the time he has held the farm at Gwernaffel, now running towards the close of a twenty-one years' lease: not only has he reared much more stock, but all of the best kind, as beyond the Herefords, a flock of five or six hundred well-bred Shropshires will be sold in the spring, when Mr. Green gives over the farm to the incoming tenant, Mr. Morris.

It is some years since we looked through the Herefords handy home to the Lodge by Leintwardine, where any man who can appreciate the pleasures of a country life might spend "a happy day." He shall see a fox found in one of the romantic Downton dingles, come across a cock in the covers, or throw his fly for a trout; while in the evening when he is made welcome again at BACHELORS' HALL, he shall join in a deal of talk over his glass of honest port about the white and the mottled faces, and the sort of horse—"that you don't see now"—which old Spectre left about in these parts as a monument to his memory. And Mr. Green will, now again, centre his strength on the home herd here at Marlow.

On Friday we toiled up from Knighton under a splendid autumn sun two miles, all up hill, but were well repaid by the sight of the magnificent stock that was waiting our inspection. It was certainly astonishing that cattle all lying out on the top of a Welsh mountain could be brought to such a great size—one cow, Beauty the 3rd, though suckling a calf, was supposed to weigh near twelve score per quarter. The first lot, 15 years old and lame, fell to Messrs. Smythies and Grasett for 36 gs., and her heifer-calf to Mr. Arkwright, of Hampton Court, Herefordshire, for 80 gs., which was the highest-priced calf. 130 gs. (the best price reached by any animal) was given for Duchess the 7th (lot 68) by Mr. Jones, of Shropshire. She is from the famous Dowager, and is own sister to Dauphin the 2nd, now in the possession of Mr. John Hill, of Felhampton, Salop, not him late of Golding, but a nephew of Lord Hill, the Lord-Lieutenant of Shropshire, who is taking a high position as a bull breeder, and who was the second largest purchaser at the Gwernaffel sale, the incoming tenant, Mr. Morris, taking the first place in that respect. Another own brother (lot 68), Dauphin 4th, is now at Marlow, as well as his half brother, Dauphin the 1st. Perhaps the most remarkable lots were the Cherries, of which there were twelve, all showing a most remarkable

family likeness, the twelve, including one heifer-calf, made 661 gs. The cow stock, including the bull-calves on their dams, averaged £44 11s., which must be considered a fair price, as Mr. Green has reserved some of his best animals for his Marlow farm.

The only animal on which there was the least reserve was the bull Renown, who, being 14 years old and lame, nobody felt inclined to buy at 50 gs., so he will go to Marlow. The 2nd lot of bulls was Candour the 5th, a bull bred by Mr. Green, but now the property of his neighbour, Mr. Farr, who was allowed to put him in the sale. The next lot was Reform, a bull kept by Mr. Green for the use of his small neighbours, whose cows he always served at a nominal sum to prevent their keeping bulls of their own which they turn out. Mr. Green has always grown bulls for the million, never castrating a calf, and having a fixed price, "first come first served" being his motto; the bulls offered for sale had therefore not been picked over up to the time of the publication of the catalogue. Mr. Green's price being £30, and the average of those left being 41 gs. must be considered a tolerably good one. It would probably have been higher had not Mr. Preece's conversational powers led him into darkness before he finished. The chief features of the herd were their great size, constitution and flesh, and their docile tempers were remarked by everybody.

Scattered through a very large company were Sir J. R. Bailey, Bart., M.P.; Sir R. G. Price, Bart.; Major Peplow, M.P.; Mr. G. H. Arkwright; Colonel Bridgford; Colonel Price; Mr. R. D. G. Price; Rev. J. Rogers; Rev. E. J. Green; Mr. R. E. L. Burton; Mr. Heywood; Mr. G. Smythies; Mr. Thomas, Monaghty; and nearly all the leading breeders and farmers from the homes of the whitefaces.

COWS AND HEIFERS.

- 1 Miss Grove, calved 1859; by Vanguard (1109), out of Old Governess by Old Sovereign (404).—Smythies and Gresset, 36 gs.
Her heifer-calf, calved February 4th, 1874.
- 2 Miss Grove the 5th, by Renown (2719).—Mr. G. H. Arkwright, 80 gs.
- 3 Jessie, calved October 22nd, 1861; by Shamrock the 2nd (2210), out of Lotty by The Admiral (1078).—Mr. Morris, 33 gs.
Her heifer-calf, calved March 30th, 1874.
- 4 Jessie the 2nd, by Gift (3125).—Mr. Morris, 16 gs.
- 5 Countess, calved December 22nd, 1862; by Shamrock the 2nd (2210), out of Pretty Maid by The Admiral (1078).—Mr. F. C. Cobden, 35 gs.
- 6 Duchess, calved 1862; by Kinlet (1293), out of Dowager by Beefy Ben (1869).—Mr. Morris, 40 gs.
- 7 Cowslip, calved 1865; by Zealous (2349), out of Cowslip by Vanguard (1109).—Mr. Bailey, Rosedale, 32 gs.
Her heifer-calf, calved July 1st, 1874.
- 8 Cowslip the 7th, by Dauphin (3058).—Mr. Bailey, Rosedale, 14 gs.
- 9 Duchess the 2nd, calved 1865; by Zealous (2349), out of Dowager by Beefy Ben (1869).—Mr. J. Hill, 71 gs.
Her heifer-calf, calved December 25th, 1873.
- 10 Duchess the 14th, by Sir Roger (4133).—Mr. T. L. Brewer, 66 gs.
- 11 Gem the 2nd, calved 1865; by Zealous (2349), out of Gem by Beefy Ben (1869).—Sir V. Cornwall, 45 gs.
- 12 Cherry the 2nd, calved 1865; by Zealous (2349), out of Cherry by Vanguard (1109).—Mr. J. Hill, 51 gs.
Her heifer-calf, calved July 27th, 1874.
- 13 Cherry the 20th by Renown (2719).—Mr. J. Hill, 16 gs.
- 14 Vanity, calved 1865; by Vanguard (1109), out of Vanquish by Beefy Ben (1869).—Mr. Morris, 50 gs.

SALE OF MR. MARJORIBANKS' ANGLO-ALDERNEYS,

AT BUSHEY, WATFORD, ON SEPTEMBER 25.
BY MR. JOHN THORNTON.

Some years since Mr. Marjoribanks changed over from Shorthorns to Alderneys, but his second venture has not been so successful. His present herd, bred from the whole-coloured stock of Mr. Dauncey, Mr. Simpson, and Mr. Duncan, was often coarse, and the prices realised indifferent, considering the original outlay. Forty-one cows and heifers made 1,406 gs., at an average of just over 34 gs.; and four bulls 107 gs., at about 27 gs. each. Gladstone, the bull used of late, is chiefly noticeable for his size; and he was sold for a price at which if he carries all that "fat within," he might be salted down. Amongst the company were Mr. Simpson, Mr. Middleton, Mr. Fuller, and Mr. Beadel, all Jersey "fancy," but they were not very keen; and Mr. Drake, Mr. Barnes and others, did more to help the sale, while Colonel Wilson and Mr. Capel took a few really good cows at the best prices. A Southdown flock, showing more breeding than the cattle, was also sold, as Mr. Marjoribanks contemplates leaving Bushey, and 405 sheep, made £889 14s. 6d. The following are the prices and purchasers of the herd, all "self-coloured," and bred from English stock.

COWS AND HEIFERS.

- Peach, by Bushey, out of Pink.—Mr. Mutton, Brighton, 35 gs.
 Amy, by Bushey, out of Ada.—Mr. W. Jones Loyd, Langleybury, Watford, 27 gs.

STEER.

Master Hews.—Mr. Looker, 28 gs.
The Shropshire ewes sold at from 50s. to 60s., the ewe lambs from 30s. to 40s., and the rams from 4 gs. to 13 gs.

SHORTHORN SALES IN LANCASHIRE.

BY MR. JOHN THORNTON.

MR. ROBINSON'S SHORTHORNS,

AT EDGE HILL, ULVERSTONE, ON TUESDAY, SEPT. 29.

The excitement naturally arising from the great prices realised at the Holker and Underley sales had hardly subsided when three other sales took place in the county. These were, although good and pure bred Shorthorn cattle, not of the fashionable blood, nor in, we might almost say, the same element. Mr. Robinson, although living within half-a-dozen miles of Holker, had pinned his fauoy to the show-yard and Booth blood, and certainly brought out some very fine cows and young bulls. The Rita tribe had taken a large number of prizes at the Ulverston and North Lancashire shows, and old Rita herself, lot 2, was a very grand cow to see; on short legs, while very deep and round in the body, with a sweet head, to these qualities she added milk and a propensity to breed heifers. Mr. Robert Jefferson got her in-calf at 71 gs.; the daughter, lot 7, was, if anything, as good if not better than herself, but having been gored by another cow she lost her calf prematurely and made but 50 gs. Another good tribe came from Mr. Jon. Peel, of Knowlmer. They were of short descent, with a missing link in the son of Major, whose daughter, Principessa, by Mr. Booth's Valasco, grew into a massive cow, and left her structure and heavy flesh to her issue. Lot 6, Queen of Somerton 2nd, was quite a model of symmetry, but being in use Mr. Chapman got her at a trifle over market price. He also took her heifer, a thick, good white, at 42 gs.; and here was noticeable the large number of whites, and their general excellence. They came doubtless, by their colour and their goodness also, through their sire Prince Alfred, a remarkably long, fine, white bull, bred by Mr. Hugh Aylmer, by Prince

Christian, from Chamian by Valasco (15443). This bull had won several prizes and cups, but being now in years was retained with two or three cows as a nucleus for another herd.

The best day's work, however, that Mr. Robinson did in buying, was when he purchased two cows and calves of the Waterloo and Flower tribes from Aylesby. They were sold as culls, still they had the blood, and the public appreciated it; Water Fay, a white seven-year-old cow, rather rough but very useful and a good breeder, ran up to 100 gs., and her two heifers, both white, and of great promise, were bought at 95 gs. and 110 gs. respectively, by Mr. Beattie, of Newby, who has others of the same tribe, with one of which, Warrior's Plume, he won the first prize for cows at the Wolverhampton Royal. The Flowers had bred bulls, and nice calves they were, making 63 gs., 56 gs., and 30 gs. each. Julius Cæsar (31452), a red bull of the Fame tribe, bred by Messrs. Atkinson, having been bought of them as a calf, had grown into a massive thick show-bull, and had also taken several prizes in the county. Mr. Sisman took him at 165 gs. into Huntingdonshire, after competition from Mr. Easton on the part of an Aberdeenshire breeder. The sale was well attended by a large local company, Mr. Robert Jefferson doing the honours at the lunch; but heavy showers occasionally interrupted the business, which nevertheless was very satisfactory, the total exceeding the anticipations of the owners. Some pure Leicester sheep, the property of Mr. Kennedy, were sold after the Shorthorns, at prices ranging from 58s. to 72s. for ewes, and about 30s. for lambs.

COWS.

Bridesmaid, white, calved Nov. 2, 1864.—J. Grimes, Lincolnshire, 29 gs.
Rita, roan, calved Feb. 1, 1865.—R. Jefferson, Preston Hows, Whitehaven, 71 gs.
Flora, red, calved Aug. 13, 1865.—Grimes, Lincolnshire, 46 gs.
Rita 1st, roan, calved May 11, 1867.—Richardson, Hutton, Penrith, 30 gs.
Water Fay, white, calved Aug. 29, 1867.—Jefferson, Preston Hows, 100 gs.
Queen of Somerton 2nd, roan, calved Jan. 2, 1868.—W. Chapman, Nottingham, 36 gs.
Rita 2nd, roan, calved April 16th, 1868.—Richardson, Hutton, 50 gs.
Lady Fitz, light roan, calved March 25, 1869.—John Ashburner, Elliscales, Dalton, 31 gs.
Laura Maria, roan, calved Oct. 4, 1869.—Proud, Lane House, Ulverstone, 36 gs.
Christiana, roan, calved July 5, 1870.—Toppin, Skelton, Penrith, 58 gs.
Audrey 12th, roan, calved Sept. 6th, 1870.—H. Caddy, Rougholm, Ravenglass, 24 gs.
Lily, white, calved Sept. 25, 1871.—Mr. Jefferson, Preston Hows, 45 gs.
Rita 4th, roan, calved Oct. 18, 1871.—Mr. Jefferson, 54 gs.
Lavina, white, calved March 7, 1872.—Wm. Barton, Ulverstone, 65 gs.
Eliza 19th, red and white, calved April 21, 1872.—Currie, Halkerston, Gorebridge, 42 gs.
Christine, white, calved April 26, 1872.—W. Chapman, Nottinghamshire, 42 gs.
Rita 5th, white, calved Sept. 29, 1872.—E. Wortley, Ridlington, Uppingham, 33 gs.
Water Well, white, calved Oct. 3, 1872.—James Beattie, Newbie House, Annan, 95 gs.
Lively, white, calved Oct. 18, 1872.—Jefferson, 35 gs.
Catherine, roan, calved Jan. 1, 1873.—Currie, Halkerston, Gorebridge, 65 gs.
Nursemaid, white, calved March 30, 1873.—J. Atkinson, Peeply, Bywell, Felton, 32 gs.
Lady Fitz 2nd, white, calved July 23, 1873.—Withdrawn.
Flora's Beauty, roan, calved Aug. 10, 1873.—Grimes, Lincolnshire, 31 gs.
Audrey 13th, white, calved Aug. 24, 1873.—E. Warhurst, Lowick, 21 gs.

Rita 6th, white, calved Aug. 27, 1873.—Gaitskell Hall, Santon, 31 gs.
 Water Daisy, white, calved Sept. 18, 1873.—James Beattie, Newbie House, Annan, 110 gs.
 Nursegirl, roan, calved March 16, 1874.—Atkinson, Peepy, 25 gs.
 Comfort, white, calved June 14, 1874.—J. M. Richardson, Hutton, Penrith, 18 gs.
 Caroline, red and a little white, calved June 19, 1874.—Top-pin, Skelton, 22 gs.

BULLS.

Julius Cæsar, red and white, calved January 14, 1872.—Sisman, Buckworth, Hauts, 165 gs.
 Baron Rokeley, roan, calved Nov. 14, 1870.—Mr. Woodburn, Sandscale, Ulverstone, 45 gs.
 Royal Hope, white, calved March 31, 1872.—J. Ashburner, Elliscales, 63 gs.
 Rocca, roan, calved May 31, 1873.—B. Wilson, Cark, 32 gs.
 Patroclus, roan, calved Sept. 16, 1873.—Bond, Lane House, 28 gs.
 Romeo, roan, calved Dec. 18, 1873.—W. Threlfall, St. Helens, Wigan, 56 gs.
 Royal William, roan, calved May 8, 1874.—R. Ashburner, Gleaston Park, 30 gs.
 Baron Studley, white, calved May 14, 1874.—Barton, Outcast, 9 gs.
 Pandarus, roan, calved May 26, 1874.—R. Riley, Sunbreck, 17 gs.
 Fitzroy, red and white, calved July 7, 1874.—Kellet, Wind Hill, 11 gs.
 Finis, red and a little white, calved Aug. 3, 1874.—E. Warhurst, 5 gs.

MR. WHITESIDE'S SHORTHORNS,

AT HESKETH, PRESTON, ON SEPTEMBER 30.

Living on the borders of the Lancashire and Yorkshire Fells Mr. Whiteside had stocked a rather small grass-farm with a few well-bred Shorthorns, to which he added some of the Blanche tribe from Mr. Eaton's herd, and two or three from Lord Fitzhardinge and other breeders. The Rev. J. Swarbrick also put the bulk of his herd into the sale, so that the catalogue was swelled to forty-two head. The day was bright and cheerful, and Mr. Drewry, Mr. Harward, Mr. Purkis, Mr. Beattie, Mr. Atkinson, Mr. McLaughlin from Duncombe Park, Mr. Taylor from Wetherly Grange, were noticeable among the company. Some of the lots were large-framed good cows, but the heifers were thin and not very even. For the best-bred lots there was good competition; Mr. Willougby Wood taking Emily by Secoud Duke of Collingham from Star of Eve, of Mr. Rich's breeding, of the old Bustin blood, at 61gs. Mr. Drewry purchased Wild Rose, a Booth topped cow, of the Wild Eyes tribe, at 50gs.; while she had just calved a roan heifer-calf, for which Mr. Harward gave 37gs.; as he also took a very good yearling from her at 61gs., quite the pick of the young things. Lot 7, a Sweetheart cow by Patrician, made 70gs., and her heifer, not of great promise, 37gs., to remain in the district. Lot 16, Minstrel 3rd, a cow bred by Lord Fitzhardinge, realised 120gs., the top price of the day, and goes to Capt. Schofield. The Blanche cows were in good demand. After competition from Mr. Drewry and Mr. Harward, Mr. McLaughlin purchased Lot 11, Midnight, down-calving, at 105 gs. Her sister, a year younger, having cast her calf went very cheap to Mr. Harward at 43 gs.; but Twilight, a promising red calf from Emily, created some competition between Mr. Wood and Mr. Harward, the latter finally getting her at 71 gs.

Baron Napier, descended from the Blanche tribe on both sides, had been in use, and a level bull he had grown

into, although not of large scale. He went cheap at 40 gs., and oddly enough the highest priced bull-calf, lot 40 was by a bull of Mr. Jon. Peel's breeding. The sale all through was slow, but considering the stock they realised fair prices, as some of the calves were under a month old. The average of about 40 gs. was accordingly reduced to £38 17s. 6d. for the 42 head catalogued.

MR. THOM'S SHORTHORNS,

AT BURGH, CHORLEY, ON OCTOBER 1.

A heavy steady downpour, a place in a state of general repair, and the contractor's conveyance with the luncheon broken down two miles away, were not inspiring for a Shorthorn sale. However, the cattle were got nicely under cover in the low steadings generally prevalent in Lancashire. Mr. Thom's herd is of short duration. Mr. Davies' sale supplied several, but most of them died off in that bleak bit of country, and other herds were resorted to. Mr. Blackwell's supplied Anna 5th and Lioness, as well as some others, at good figures. Mr. Bracewell's contributed Diamond Rose and Belle Flora, and Flag of Ireland and Bismarck Baron were private investments from Mr. Torr of Aylesby. Two very fine bulls they were: one a white, brother to Mr. Bonstead's show-yard crack, Flag of Britain; the other a red thick-fleshed animal of the Bright tribe. Three Gwynnes from Mr. Caddy, and one or two Lucys from Mr. Dickinson, completed the purchases for a time, and with them the herd made a fair start. But last autumn Royal Rose was bought at Mr. Downing's Sale, County Cork; as she was at the time a show heifer, and her excellence as one of the most promising of those out this season made her a general topic both in the Yorkshire and the Lancashire show-yards. Hustled by a crowd at Preston, she became very excited; and the excitement brought on premature calving, spoiling her sale and also her chances of not only claiming her premiums, but affecting her future productiveness. Circumstances, however, caused the herd to be brought suddenly into the market, and although there were many breeders present, yet the wet day kept the bulk of the local people away. After some assistance, the tent was got into fair order, and a stand-up lunch took place, Mr. Towneley Parker not hesitating to give the company a toast. For the best lots there was ready and quick competition, but for the outsiders the bidding was slow and some bargains were to be had. Several of the cows were very grand animals, particularly Anna 5th, a fine roan, bred by the Rev. J. Storer, and one of the best cows out this season. She was bought by Mr. Tindall, of Lincolnshire, for Mr. Junius, as it was rumoured to go abroad. Rhoda Gwynne, another grand cow not breeding, made hardly beef price; and her heifer, Rhoda Gwynne 2nd, down calving, was a bargain at 135 gs. Mr. Pickersgill, who was the last bidder on Anna 5th, took two of the Gwynne heifers at moderate prices; and Lioness, a fine red cow which had just calved a roan heifer-calf, was also purchased by Mr. Tindall. He likewise bought Flag of Ireland at a ridiculously low price, and Bismarck Baron goes to Mr. Smith, of Hull. Royal Rose was put up at 150 gs., but there being no bid she was reserved. After the sale an offer was made, but it was reported "not a thousand guineas would buy her." Some cart mares sold fairly well, some thought cheap; and a small lot of Leicesters went mostly to the butchers.

SALE OF THE WESTERTOWN BLACK POLLED HERD.

This herd was begun in the time of the father of the late tenant, Mr. Brown, but it only arose into notice under the management of the gentleman whose death is the cause of the sale. The best blood in the herd was drawn from the stock of Tillyfour and Mains of Kelly. No one better discerned the true promise of an animal of the Polled breed than the late Mr. Brown; and to this quality was due his success as an exhibitor and the reputation in which the herd was held. At the luncheon Mr. M'COMBIE, M.P., said although Mr. Brown was not born with a silver spoon in his mouth, he placed himself in the highest rank amongst the farmers of Scotland. He had left few equals in Scotland. Mr. Brown was one of his oldest acquaintances, and his confidence in his skill as a breeder was unlimited. He had examined the stock for sale, and he must, in justice, pronounce them to be of the very highest character. This stock consisted of 23 cows, 2 two-year-old heifers, 21 yearling heifers and heifer-calves, and 11 bulls and bull-calves. The whole were descended from two cows, Violet (389), and Rose of Westertown (381); a two-year-old heifer, Victoria (385); and three heifer calves, Rose 3rd (925), a daughter of Rose just mentioned; Duchess of Westertown (927), and Lady Ann of Westertown (926); being the sole survivors of the herd Mr. Brown had raised at Westertown previous to its decimation by pleuro-pneumonia, caught at the Dumfries show in 1860. The most numerous were the Rose and Duchess tribes, and the latter were particularly in favour on Thursday. The highest average was brought by the descendants of Victoria. The cows realised a total of £998 11s., or an average of £43 8s.

The following is the list of purchasers and the prices paid:

Cows.

Maggie (935).—Mr. Leslie M. Cartwright, Lady Bank House, Fife, 40 gs.
 Mary (933).—Mr. Leslie M. Cartwright, 45 gs.
 Duchess 6th (1242).—Duke of Richmond, 45 gs.
 Rosemary (936).—Col. Ferguson, of Pitfour, 54 gs.
 Beatrice (937).—Mr. M'Combie, M.P., of Tillyfour, 53 gs.
 Carrie (939).—Mr. Paterson, Mulben, 35 gs.
 Rosa Bonheur (940).—Mr. Brodie, of Lethen, 56 gs.
 Kate (932).—Mr. Brodie, of Lethen, 29 gs.
 Duchess 5th (1241).—Sir George Macpherson Grant, of Ballindalloch, Bart., 66 gs.
 Victoria Regina (931).—Duke of Richmond, 51 gs.
 Alice (1243).—Earl of Aberdeen, 55 gs.
 Susannah (942).—Mr. Gwyer, Bialld, Badenoch, 46 gs.
 Duchess 2nd (935).—Mr. Gwyer, Bialld, Badenoch, 46 gs.
 Rosebud (1244).—Mr. Dingwall Fordyce, M.P., 41 gs.
 Violet (929).—Duke of Richmond, 30 gs.
 Lizzie Ann (1240).—Mr. Barclay, M.P., 32 gs.
 Rosedale (934).—Mr. Brooke, Cardney, Dunkeld, 38 gs.
 Blackberry (1903).—Mr. Hunter, Dipple, 30 gs.
 Rose 3rd (925).—Sir G. M. Grant, Bart., for Tomore, 30 gs.
 Dandy (949).—Mr. Leslie M. Cartwright, Fife, 37 gs.
 Duchess (927).—Mr. Barclay, M.P., 29 gs.
 Lady Ann (926).—Mr. Mackessack, Earnside, 39 gs.
 Lucy, (1906).—Mr. Hay, Trochelhill, 24 gs.

TWO-YEAR-OLD HEIFERS.

Rosalind (1905).—Mr. Anderson, Viewfield, Urquhart, 49 gs.
 Augusta (1904).—Mr. M'Combie, of Easter Skene, 48 gs.

YEARLING HEIFERS AND HEIFER CALVES.

Duchess 8th (1912).—The Earl of Fife, 38 gs.
 Rosy Morn (1909).—Mr. Adam, Bowiebank, King Edward, 27 gs.
 Mary Anne (1907).—Mr. Calder, Muriton, 23 gs.
 Rosamond (1910).—Mr. Gordon, of Wardhouse, 45 gs.
 Rosette (1911).—Mr. John Grant, Methlick, 25 gs.
 Rosa (1908).—Sir George Macpherson Grant, Bart., 38 gs.
 Maud (1913).—Mr. M'Kenzie, Elgin, for Mr. Fobes, of Cul-loden, 22 gs.
 Rosanna (1914).—Mr. M'Kenzie, for Culloden, 20 gs.
 Duchess 9th. —Mr. Paterson, Mulben, 24 gs.
 Blueberry.—Mr. Jas. Milne, Gateside, Tarves, 15 gs.
 Heifer calf of Rose 3rd (925).—Mr. Walker, Altyre, 16 gs.
 Heifer calf of Kate (932).—Mr. Brown, Linkwood, 10 gs.
 Heifer calf of Mary (933).—Mr. Walker, Altyre, 36 gs.
 Heifer calf of Maggie (935).—Mr. Bruce, Broadland, 18 gs.
 Heifer calf of Beatrice (937).—Mr. M'Combie, M.P., 27 gs.
 Heifer calf of Lizzie Ann (1240).—Mr. M'Kenzie, Elgin, for Mr. Walker, Geddes, Nairn, 19 gs.
 Heifer calf of Duchess 5th (1241).—Mr. Fortune, Cullen House, 29 gs.
 Heifer calf of Dandy (949).—Mr. Mitchell, Balgreen, King-Edward, 22 gs.
 Heifer calf of Duchess 6th (1242).—Mr. Anderson, Viewfield, 17 gs.
 Heifer calf of Rosa Bonheur (940).—Mr. Grant, Ballfurth, 16 gs.

BULLS AND BULL CALVES.

Duke of Perth (357).—The Marquis of Huntly, 95 gs.
 The Shah (719).—Mr. Beattie, Dunnydeer, 27 gs.
 Bull calf of Rosedale (934).—Mr. Hunter, Dipple, 25 gs.
 Bull calf of Duchess (927).—The Earl of Aberdeen 48 gs.
 Bull calf of Violet (929).—Mr. W. M. Skinner, Drumlin, 16 gs.
 Bull calf of Victoria Regina (931).—Mr. Brodie, of Lethen, 30 gs.
 Bull calf of Carrie (939).—Mr. Skene, Skene Park, Nairn, 21 gs.
 Bull calf of Rosa Bonheur (940).—Mr. Grant, Glenfarclas, 14 gs.
 Bull calf of Alice (1243).—Mr. Davidson, Lochyhill, 15 gs.
 Bull calf of Rosebud (1244).—The Duke of Richmond, 60 gs.
 Bull calf of Lucy (1906).—Mr. Walker, Geddes, 21 gs.
 The total proceeds of the sale amount to £2,002 7s.

SALE OF THE DUKE OF RICHMOND'S SHORTHORNS AND LEICESTERS,

AT GORDON CASTLE, N.B.

The prices realised will scarcely compensate for the great outlays that are made every now and again by the introduction of fresh blood. The first lot exposed was a strong dark roan, Cairngorm, calved 11th May, 1873, and got by Royal Hope, a roan bred by Mr. Pawlett, Beeston, and out of Duchess 8th, by Baron Colling, a bull that has been of signal service in the Gordon Castle herd. Cairngorm is descended from a cow Juno, got by Monsieur Vestris, got by Bates' 2nd Duke of Northumberland, and own brother to the celebrated Duke of Northumberland. Monsieur Vestris, we may mention, was the first sire imported into the herd, and was perhaps one of the most valuable animals ever in it. Cairngorm was knocked out at 39 gs. to Mr. Thomson, Tynet. The second lot was a red, calved on 6th January, 1874, and is got by Baron Colling, bred by Colonel Towneley, Towneley Park. Out of Duchess 6th, the second lot is descended, like the first, from Juno by Monsieur Vestris. He was knocked out at 21 gs. to Mr. John Adams, Wester Unthank, Duffus. The third lot is a roan, calved 24th December, 1873, and is got by Royal Hope, out of Fairy Queen 5th by Baron Colling. He was knocked out cheaply at 27 gs. to Mr. Alex. Gordon, Mains of Tannachy. The fourth lot, red, calved 8th January last, got by Royal Hope, out of Queen by Baron Colling, was sold for 20 gs. to Mr. Pirie, Auchlanachie, Keith. The fifth lot, a red, calved on 18th January last, got by Royal Hope, and descended from the cow Sugar Candy, a daughter of Almond Flower, sold at 20 gs. to Mr. George Fraser, Aquhorthen, Kintore. The sixth lot, a red, calved 20th January, 1874, and got by Royal Hope, was knocked out for 28 gs. to Mr. Gregor, Wester Alves. The next, a red roan,

calved 26th January, got by Baron Colling, and descended through the fine Ury cow Queen, Mr. Stevenson, Durn, Portsoy, purchased at 20 gs. Lot 8, red, calved 10th February, 1874, and possessing the same pedigree as lot 6, was disposed of at 18 gs. to Mr. Fraser, Dryburn. The ninth lot, a roan, calved 27th February last, by Baron Colling, and out of Destiny, descended through Queen, of Ury extraction, is of large size for his age, very evenly fleshed, and has fine long soft hair. He was knocked out to Mr. Grant, Daudaleith, for 39 gs., the highest price paid for any of the young bulls, and a figure at which also the highest priced cow was sold. The tenth lot, a red calf by Royal Hope, was disposed of to Mr. Fletcher, Rosehaugh, for 28 gs. The succeeding lot was a roan, calved 18th March last, got by Baron Colling, and descended from the cow Lustre by 2nd Duke of Northumberland, was sold for 30 gs. to Mr. James Shearer, Mains of Croy. Lot 12, red, calved 21st March last, is a son of King Butterfly, bred by Mr. Jefferson, Preston Hows, a bull presently in the herd at Gordon Castle, and embracing in his pedigree four crosses of Towneley butterfly blood. On the female side, lot 12 is descended through the Ury cow, Queen, before mentioned. The bull was disposed of for 28 gs. to Mr. Robertson, Auchinreath. The last lot of the bulls was a red and white, calved 17th April, 1874, by Baron Colling, and out of Crown Princess 4th by Resource, was knocked out at 16 gs. to Mr. Lipp, Haddoch, Rothiemay. The average price of the thirteen bulls was £27 9s. 3d. Seventeen cows and heifers were offered for sale, but, like the bulls, they did not fetch remunerative prices. The cows and heifers were all supposed to be in calf either to Royal Hope or to King Butterfly. The average price of the five cows was £34 4s. 7d.; of three two-year-old heifers, £33 5s.; and of nine yearling heifers, £23 9s. Immediately after the sale of cattle, 95 Leicester ewes and gimmers and 45 Leicester rams were offered for sale. The ewes and gimmers were sold in lots of five, and the rams were disposed of singly. The sheep were on the whole fully up to the average of the lots exposed at Gordon Castle, but the prices obtained were scarcely up to the mark, the average price of the ewes and gimmers being £2 18s. 6d., and of the 45 rams within a fraction of £4 1s. The total proceeds of the sale amount to £1,299 1s.

SALE OF SIR CHARLES F. SMYTHIE'S SHORTHORNS,

AT ACTON BURNELL, SALOP, ON OCTOBER 7.

BY MR. W. G. PREECE.

A meagre affair at first sight in the eyes of the Shorthorn breeder was the Acton Burnell catalogue. Just some half-dozen bulls recently used had their names recorded, while on the fly-leaf it was remarked that "the foundation of this herd of Shorthorns was laid about forty years ago by the late Sir Edward Smythe, and first-class bulls were used from the late Lord Spencer and the Rev. Henry Berry. Unfortunately about twenty years ago the pedigrees of the herd were lost, and although every animal except one, now offered for sale, has been bred by Sir Frederick Smythe, and directly descended from a fine herd then in possession of his father, the pedigrees cannot be traced further back." Now, as we happen to know, both by oral testimony of several of the performers as well as from a bundle of carefully-stored letters, something of the breeding of Shorthorns in those days when the names of Vincent, Crofton, Priestley, Mostyn, Dawson, Hill, Hampton, Pennant, and Harvey represented an enthusiastic band who gathered around Berry and drew direct inspiration from Mr. Bates himself, and when Henwood, Wharfdale, and Badsworth were household names upon the Welsh border, we were anxious to criticise in the flesh the actual existing merits of those early sires, to whose solid merits none can better testify than the famous breeder of the Siddington Gazelles. Breeders calculated carefully at that date, and with the gravity of a senate, what move should next be taken. And they were ever ready, even for a small herd, to invest

fifty to a hundred guineas in a bull-calf at a period when long prices were comparatively unknown. Now-a-days, when numbers buy who have no idea what they are about except that such and such a tribe made startling prices at such and such a sale, and when every catalogue they lay hands on is prefaced with a reference to Mr. So-and-so's celebrated cow, of which no one ever heard before, men have no conception of the trouble taken in building up those old herds; of the days spent in consultation and the pilgrimages taken in search of a cross, of the high-priced postal conferences upon the next move, when it took a fortnight to travel what you can now traverse in six hours. Never was coterie kept more select, never club more exclusive, than the deliberately sanctioned elements of those early Shorthorn herds. They went then for milk no less than for the mellow skin and quickly forming beef. They would have nothing to do (we have heard it from their lips many times) with any bull whose female relatives gave less than from 20 to 30 quarts of milk a day. Now that the era of keeping a conglomerate herd, something of all sorts, in fact, bought here and there and everywhere, is passing, and men are setting down each one to develop a distinctive family, it is to those early sorts that they will have to resort. The trade in Shorthorns is increasing, its delicious interest unabated. There is necessity for a new infusion into the veins of the precious Duchess tribe to which breeders will look long as they can for their bulls. Some would use the Red Roses, some (condoning the Bridecake blot) would sanction the Grand Dukes, others state fairly that they look for a coming race. Whatever shall it be? Time alone can tell. Mr. Bates in his sphere, and under his circumstances, was undoubtedly a grand man, and had grand chances. But would anyone superstitiously deny that now-a-days such chances are multiplied a thousandfold, or that there are breeders alive who are scarcely, if at all inferior to that distinguished pioneer. How did Messrs. Bolden, Wetherell, Eastwood venture to leave this beaten course, with such success, too, both pecuniarily and otherwise? Who can forget at the Dunmore sale the distinct and exquisite style of beauty a certain Bright Eyes heifer had clearly derived from a Butterfly cross?

And in last week's paper is not Mr. Drewry recorded to have bought a Wild Eyes cow having "some high-class intermixture of Booth blood" in her? This is the right thing to do, as this Acton Burnell sale amply showed. Their bulls, recently used, had in their veins the blood of the Charmers of Booth's Crown Prince, of Mussulman, of Favorite, of Bolinbroke and the Lane Bull, all upon a sort of Bates' foundation and the result in elegant type of really first-class cattle of which some dozen might have graced the proud pastures of Uderley and Holker was immediately and heartily acknowledged, and those who viewed them. The old disused silver mines will, consequently, have to be re-opened. Upon our arrival we were led at once to admire the deep meaty backs of the deer, which fed up right to the very windows of the hall, which is an interesting place at first sight. The two standing gables of the ruined house, where once an English Parliament sat, close by in the park, carried the mind deep back amidst the pages of history, yet prior to Shorthorn records. Substituting "lake" for "stream," the mansion of Acton Burnell involuntarily suggests Mrs. Hemans' lines:

The stately homes of England,
How beautiful they stand!
Amidst their tall ancestral trees,
O'er all the pleasant land.
The deer across their greensward bound
Through shade and sunny gleam,
And the swan glides past them with the sound
Of some rejoicing stream.

But hastening to the well littered and comfortable folds, where our business lay at the home farm, two hundred yards off, we found a lot of cattle that took our breath away at once with admiration. We had in our pocket a commission to buy two within certain limits of price, but we were able to secure not a single specimen, so well was their true worth recognised by the assembled crowd. Every neighbour knew how correct was the statement, that for forty years they had been bred from recognised sources, and of late with exceeding care. The shortleggedness of the Acton Barnell herd was once a joke. But, in a word, the animals subjected to the auctioneer's hammer this day were of about the *most uniform type throughout that we ever remember to have seen*. A number of short-cross animals disfigured the pure-bred lot and reduced the average. Their general character was this—their colour the old-fashioned yellow, neat stylish heads well set on, with full deer-like eyes; their quarters were long, dewlap square, their backs wide, their ribs round as a cask, and their meat was put on throughout where it was wanted. They were as stylish a lot as we have seen for some time. The company was small, but there was no lingering; and the average throughout (including all pure and half-bred) nearly 30 guineas.

Taking the pure-bred tribes—five being calves—of the females—

	£	s.	d.
Four <i>Janettes</i> averaged	29	14	3
Seven <i>Luettes</i> averaged	38	5	0
Two <i>Daisies</i> averaged	42	0	6
Three <i>Robbies</i> averaged	49	7	0
One <i>Chilton Duchess</i> (doubtful breeder)	63	0	0
Three <i>Lilies</i> averaged	58	9	0

which must be considered, under all circumstances, an encouraging first sale. A number were bought for exportation to Canada, and will doubtless be heard of again. There was a hearty wish expressed that Sir Frederick Smythe may be able to put together as good a lot again. He has the same adviser to go on with in Mr. Smith, of Drax Abbey, a gentleman of proved experience in the business.

SALE OF MR. W. BARNES' SHORTHORNS.

AT WESTLAND, IRELAND, ON OCTOBER 13.
BY MR. THORNTON.

Three years since the late Mr. Thomas Barnes died, and his herd, when sold whilst passing through a severe attack of foot-and-mouth disease, averaged nearly £100. From a few old cows the present proprietor of Westland, Mr. W. Barnes, endeavoured to rear another herd; but so severe was the complaint, that most of them turned out useless. From one of them (Blossom—lot 3) the bull-calves were bred, and another, also of the Isabella tribe, produced a heifer—Princess Charlotte—which sold for 61 gs. At Mr. Grove Wood's sale, Mr. Barnes purchased three females of the Lady Sarah tribe; but these were also smitten with the disease, resulting in abortions and the slaughter of the best of them, Lady of the Lake, as hopeless by barren. A few animals were got from Mr. Keynell's sale, and were more fruitful. Royal Prince (27384), of the Mantalini tribe, that had been hired by Mr. Torr just prior to the late Mr. Barnes' death, was returned in due course to Westland, and just as he was proving one of the finest sires of the day, he too died. Mr. Chaloner, whose beautiful demesne adjoins Westland, latterly increased his herd and continued the practice so long carried on by him and his neighbour, of hiring a bull from Mr. Booth, of Warlaby. Mr. Wm. Barnes joined Mr. Chaloner in this taking, and had a part share of King James (28971),

whose calves were greatly admired, not only at King's Fort, where seventeen of them disported themselves in the park—the perfection of hair, colour, and symmetry—but at Westland, where the three youngest heifer-calves, all by King James, were quite the pick of the herd. There were also three nice bull-calves, two being white, an unfortunate colour for Ireland.

The company was not large, owing to the Kells quarter sessions, but they comprised several of the leading breeders from Ireland, Mr. E. A. Fawcett and Mr. Jackson (Sir F. C. Smythe's agent) being present from England. For lot 1, Lady Martha, of the Lady Sarah tribe, one of the best Booth and Mason bred cows in the country, there was keen competition, notwithstanding that she had broken her service and Mr. Gumbleton took her into County Cork at 71 gs.; as also Lady of the Valley, a red heifer of the same line, at 165 gs. Blossom, a good Isabella cow, still slightly lame from the effects of the distemper, had bred a couple of white bulls, both of which Lord Dartrey bought, whilst the dam herself goes to County Cork. Lot 5, Duke's Butterfly, with two Booth crosses on the Barnton Rose, was small and thin, still a good breeder, as her calf by King James made 140 gs., the second best price of the day, to remain in the county as an ornament to the herd of Mr. Garnett, who also got Princess Butterfly at 83 gs., and lot 5, Duke's Butterfly ran up to 81 gs., Mr. J. M. Dorau the buyer. There were some nice animals of Mr. Holmes' Fairy Queen tribe, descended from a Matchem 23 gs. cow, which he bought of Mr. Bown in 1829, and from whom originally came the Oxfords. Lot 8, Arragh-na-Pogue, was a very cheap purchase at 37 gs. (Mr. Braikenridge), and a heifer-calf, the Last Rose of Westland, a very handsome roan, with abundance of hair and great substance, also went to the same purchaser at 41 gs., as it was rumoured to go to England. Remus, the first bull, a twin, had the disease badly as a calf, and never grew to any size, so Major O'Reilly got him at 51 gs. The sale quite exceeded what every one had anticipated, owing to the doubtful state of several of the best heifers; while it was helped unquestionably by Mr. Barnes' known determination to relinquish Shorthorn breeding, the average being 63 gs. for Mr. Barnes' eighteen head, while Mr. Reynell's made about £34.

SALE OF MR. WELSTED'S SHORTHORNS.

AT BALLYWALTER, IRELAND, ON OCTOBER 15.
BY MR. THORNTON.

This sale took place, as usual, the second week in October at Ballywalter, County Cork. Nine bull-calves of this year were catalogued, and twenty-two cows and heifers, several of which were missers—a complaint general this season throughout the South of Ireland. For the bull-calves, which were all after England's Glory (23889), one of Mr. Booth's sires recently in service at the Royal Farm, Windsor, there was brisk and keen competition, the two just making 51 gs. each; while Lord Rosslyn, a very fine roan calf of February, ran up to 73 gs. (Capt. Butler). As usual with Irish white calves, a very handsome-looking, and well-bred one too, made only 16 gs.; but a red and white April calf of the Victoria tribe was bought by Mr. David Gibson for 68 gs. For those cows and heifers which were safe in calf, there were half-a-dozen good bidders. Mr. Braikenridge got the two best—Cowslips the 15th and 17th—both heavy in-calf, at 61 gs. and 83 gs. respectively. Mr. Stowell Garnett, after strong opposition from Major McCraith, Mr. Franks, and Mr. Creuer, of Kenmare, bought Perseverance at 58 gs. and Golden Tint at 57 gs., which may be considered the pick of the heifers. For the others the prices were low, owing, perhaps, to the Bandon show and a Limerick fair, which kept people away.

The cattle were brought fresh off the grass, and were not in any way prepared for sale. The bulls averaged £43, the highest yet obtained at Ballywalter, and the nineteen cows and heifers £38. It was rumoured that King Richard 2nd is likely to be here during the next season.

MR. R. WOOD'S SHORTHORNS AT CLAPTON.

ON OCTOBER 9. BY MR. H. STRAFFORD.

The Clapton herd has been very carefully bred for the past thirty years, chiefly from the stock at Burleigh Park, and of Messrs. Bagshaw, Johnson, Manning, and other breeders. During this period the following first-class bulls have been used: Reo Bulla (10703), Henry 5th (19944), Britannicus (17452), Fitz Sir James (19761), and Viscount Oxford (23151); latterly the Royal prizewinner, Lord Chancellor (20160), and his son, Lord Aberdeen 2nd (29055), along with the Worcester Knight 30156). Lord Chancellor was bred by the late Mr. Jonas Webb, and sold at his sale in 1863 for 400 gs. The herd included twenty-one cows and heifers and eleven bulls. The former averaged £39 3s. each, equalling £822 3s. for the lot. The bulls averaged £35 4s. 5½d. each, making £387 9s. for the eleven. This made an average for the 32 head of £37 16s., thus giving a total of £1,209 12s. The following are the chief prices: COWS AND HEIFERS—Alexandra, 44 gs., Mr. J. Freeman, Sevenoaks; Louisa 13th, 31 gs., Marquis of Exeter; Mysie 24th, 46 gs., Mr. J. Freeman, Stoke Doyle; Louisa 11th, 51 gs., Mr. Thomas Mace, Sherborn; Joan 17th, 44 gs., Mr. J. Freeman; Dahlia, 40 gs., Mr. Wortley; Louisa 12th, 61 gs., Mr. Thomas Mace; Joan 19th, 43 gs., Mr. Wright, Nottingham; Louisa 14th, 55 gs., Marquis of Exeter; Louisa 15th, 55 gs., Marquis of Exeter.—BULLS: Lord Chancellor, 50 gs., Mr. H. Webb, Streedy Hall; Dairyman, 40 gs., Mr. G. Hodgkinson, Newark; Duke of Aberdeen, 41 gs., Mr. W. Linnell, Woodford Lodge; Lord Waterford, 42 gs., Mr. Thomas Elderkin, Keystone. Fawsley Star, 49 gs., Mr. J. Webb, Melton Ross, Lincoln.

SALE OF THE EARL OF SOUTHESK'S HEREFORDS AT BRECHTEN, N.B., BY MR. THORNTON.—On October 7, there was a large company, and a good competition for the Hereford cattle, several visitors coming all the way from the native district of the Whitefaces, and coming to buy. Some of the best went back—as lot 1, a cow twelve years old to Herefordshire—but more remained in the North, whilst a few go to Ireland and some cross the Atlantic. Diadem, lot 7 (a first prize heifer at the English Royal), was dead, but her calf made 27 gs.; this was said to go to America. Queen of Hearts (lot 11), a grand cow, with quality and style equal to any Shorthorn, was bought for 68 gs. by Mr. T. Rogers, Herefordshire. She was the top price for females; but Desdemona and her calf made between them 91 gs.; while King of the Lilies, the bull, after some strong competition, was knocked down for 135 gs. to Mr. W. J. Britten. The 43 lots sold made £1,495 4s., or an average of £36 15s. 6d.

SALE OF MR. LYALL'S SHORTHORNS AT SOUTHESK, BY MR. THORNTON.—Immediately after the sale of Lord Southesk's Herefords, a herd of Shorthorns, belonging to Mr. Lyall, was disposed of. The cows sold cheap, and possibly the sudden thought—to avail himself of the opportunity to relieve himself of the charge of a breeding stock, which had been in existence a quarter of a century—cost Mr. Lyall somewhat dear; as the local buyers took most of the lots, at their own prices; Mr. Jonathan Rigg (of Wrotham Park,

Kent), and Mr. J. D. Allen (Wilts), and Mr. F. R. Smith (Derby), being, apparently, the only English competitors. The first named took the two best females of the Duchess Nancy (same as Kirklevington) tribe, at a little over 100 gs. the pair. Cactus, lot 19, caught Mr. Allen's fancy at 60 gs., the top price made by any of the herd; whilst Duchess Annie, lot 8, the oldest of her family, the Duchess Nancy, was not offered, though a good bull-calf from her was making 34 gs. The 36 lots sold made a total of £1,069 19s., or an average of £29 14s. 6d. The old Darlington bull, Duke of Dursley (25953), was reserved. His calves were of no special character.

SALE OF MR. FISHER'S SHORTHORNS AT PITLOCHRIE, N. B., OCTOBER 8TH, BY MR. THORNTON.—Although the company at Mr. Donald Fisher's could not be called large, it was evidently intent on business. The distance was too great to permit of the influx of the ordinary lookers-on; but the English buyers who did attend were active for all the Knightly lots (the average of the Coldcream family being nearly £113 a-piece), and the results of the sale exceeded expectation. The cattle proved to be in appearance fully up to their high pedigree, having plenty of hair, good quality, and were shown in excellent condition. The names of the buyers are a guarantee for this, as some of the most careful owners of fine cattle in Great Britain are to be found among the number. Besides these there were present: Mr. Chaodos Pole Gell, Mr. Lesby Combe (Kentucky), Mr. Beans (Illinois), and Mr. H. W. B. Berwick. Mr. Mitchell, of Alloa, took the chair at the luncheon. Duchess of Knightley (lot 12) made the top price of the day (280 gs.); she had three fine Booth crosses in unbroken succession—*i.e.*, Great Hope, of the Vivandiere; Lord Hopewell, of the Halauby, and Fitzclareuce, of the Blossom tribes, from Warlaby. She was put up at 100gs. by the chairman of the day, and after keen competition knocked down to Mr. W. R. Davis (Middlesex), who took three others of the tribe, "quite the pick of the herd." Mr. A. H. Longman (Herts) gave 215 gs. for Fawsley (the solitary specimen of the Rosy tribe), and a good Coldcream heifer, too, for three figures, as did the Rev. J. Micklethwaite, of Taverham Hall, Norfolk for another heifer. The bulls were not so much in request; indeed, excepting the two sires in use these were only young calves. The oldest bull, of the same tribe as Lady Pigot's Rose of Wytham had a double cross of Lord of the Valley, and went into Aberdeenshire, where they go in for reds. But Mr. Fawkes, of Faruley, and Mr. Statter, of Manchester, brought bull-calves into England. Summary: 34 cows averaged £98 13s. 9d.—£3,353 14s.; 8 bulls averaged £34 13s.—£277 4s. 42 lots averaged £86 9s.—total, £3,630 18s.

SALE OF THE LATE MR. WETTON'S SHORTHORNS AT COLLINGTREE, BY MR. JOHN SHAW, ON TUESDAY, OCTOBER 7TH.—The total amount produced by the sale was £3,700. The following are some of the best prices: Cows—Charlotte Bronte, 31 gs., Mr. J. Gurney; Rose of Wellingborough, 48 gs., Mr. R. Phipps; Sweetbriar, 41 gs., Mr. P. Phipps, M.P.; Russett, 42 gs., Mr. H. Sanders; Duchess of Blaston, 41 gs., Mr. P. Phipps, M.P.; Juanita, 38 gs., Mr. J. N. Beasley; Ringdove, 45 gs., Mr. J. Gurney; Judy, 72 gs., Mr. F. U. Sartoris. Bulls—Fawsley Oxford 2nd, 29 gs., Mr. J. Watkins; Savoy, 35 gs., Mr. J. Gurney; George Frederick, 24 gs., Mr. R. Phipps; Robin Hood, 36 gs., Mr. R. Phipps; Sterling, 27 gs., Mr. R. York; Leolinus, 11 gs., Mr. Gillitt. A good flock of long-wools and horses went to make up the total.

LINCOLNS AT PETERBOROUGH BRIDGE FAIR (October 2).—There was a very large number of stock in the fair to-day. Bullocks, of which there was a very fine sample, made from £25 to £35 each. A parcel of 25 cows were sold at £22 6s. A few milch cows of prime quality made from £26 to £31 each, storks from £10 to £15 each. Cart horses from £50 to £80 each, Irish horses from £80 to £185 each. In the ram fair not above 200 were penned. The Welton-le-Wold (Louth) Flock, the property of Mr. J. J. Clark, were sold by auction; one made 17 gs., five rams 14 gs. each, two 13 gs. each, with an average of £11 13s. each. The Silk Willoughby Rams, the property of Mr. W. L. F. Haek, of Silk Willoughby, near Sleaford, thirty in number, are descended from the Riscathorpe and other leading Lincolnshire longwools; one made 19½ gs. and others 16 gs., 10 gs., 13 gs., and 10 gs. The Bloxholme Rams, the property of Mr. Robert Graves, nineteen in number, were sold at an average of £7. The Nocton Rise Rams, the property of Mr. Howard, twelve in number, made from £4 14s. 6d. to 5 gs.; the Potterhanworth Rams, the property of Mr. Thomas Petchell, twenty in number, at an average of 6 gs. The Ketton Rams (Mr. Swinford's) were sold privately, and made an average of from 8 gs. to 9 gs.

LINCOLN RAMS.—Messrs. Mason and Son, of Louth, offered for sale by auction, in the Cattle Market, three lots of rams. The first lot offered comprised about a dozen, bred by Mr. J. L. Needham, of Huttoft Graunge, near Altoft. They sold from five to ten guineas each, among the purchasers being Mr. F. Turner, of Armthorpe (at ten guineas), and Mr. Skelsey, of Park-lane (three at 7, 8½, and 9½ guineas). A lot of 35, bred by Mr. John Byron, of Kirby Green, made from 5 to 18½ gs. each. Amongst the purchasers were Mr. Vickers, of Pigburn (two at 9 guineas each), Mr. Keyworth, of Marr (at 8 guineas), Mr. Milward, of Clifton (at 8½ and 11½ guineas), Mr. Batty, of Conisbro' (at 18 guineas), Mr. Hewitt, of Alnhome (at 8 and 11 guineas), and Mr. Eland, of Hatfield (at 10 guineas). Some very fine rams belonging to Mr. J. F. Clark, of Welton-le-Wold, were also disposed of.

THE HAMSEY PLACE SUSSEX CATTLE.—On Wednesday, Sept. 30, the herd of Sussex stock, the property of the late Mrs. Dorothy Guy, were sold by order of the executors, when the majority of the stock was bought by Mr. Ellis. Of the cows Mr. E. Cane (Berwick), bought one five years, for 26½ gs.; Mr. C. Ellis (Beddingham), one 7 years, 21½ gs., ditto, 24½ gs., one six (with calf) 22½ gs., one seven, 21 gs., and one four, 21½ gs.; Mr. W. Mannington, one five, 20½ gs.; and Mr. H. Poole (Lewes), one seven, 18½ gs. For an Aberny, Mr. Aylwin gave £12 12s., and for a cross-bred Mr. J. Martin gave £11. Of the heifers Mr. Ellis bought six three-year-old heifers for 17 gs., 20 gs., 23 gs., 22½ gs., 23 gs., and 20 gs. respectively, and four two-year-olds for 22 gs., 23 gs., 23½ gs., and 26 gs. respectively; Mr. J. Guy bought a two-year-old for 22½ gs.; Mr. Ellis also purchased five yearlings for 16 gs., 15 gs., 15 gs., 15½ gs., and 17 gs., and a yearling (with a cross-bred) for 23½ gs.; Mr. W. Mannington gave 22½ gs. for a yearling; and Mr. Ellis purchased a weanier for 7½ gs. Mr. G. T. Coote bought five weaners for 10½ gs., 10 gs., 9½ gs., 7 gs., and 12½ gs., whilst Mr. Thomas gave 5½ gs. for a cross-bred ditto. For steers Mr. R. H. Ellman paid 42½ gs. for a pair of two-year-olds, and £14 10s. for one; Mr. Ellis giving 30½ gs. for a pair. Mr. W. Mannington bought a pair of yearlings for 35 gs., and Mr. Ellis three for 40 gs. For a pair of weaners Mr. Ellman gave 18 gs., and for three Mr. Colgate (Glynde), paid 26 gs., whilst Mr. J. S. Ade obtained one ditto, and one cross-bred for 17 gs. Mr. Ellis purchased a pair of two-year old cross-breeds for £14 10s., and one for £14 10s. For two Mr. Colgate gave £37 10s., Mr. Rosseter (Iford), (three lots), £39 10s., £31 10s., and £32 10s.; Mr. S. Watford (Lewes), £37 10s., and one for Mr. Ellman gave £16 10s. For the two-year-old Sussex bull Warwick (215), calved December 6th, 1871, bred by the Right Honourable the Speaker, Mr. Ellman gave 23 gs. There was a good lot of horses, Mr. Ellis, the principal buyer, obtaining a cart mare, fourteen years, for 50 gs.; a gelding, five years, 77 gs.; four years, 48 gs.; a mare, eight years, 66 gs.; five years, 77 gs.; a gelding ten years, 43 gs.; a mare eight years, 42 gs.; and a mare, eleven years 30 gs. Mr. James Peckham gave 65 gs. for a gelding five years; Messrs. Nash and Co. (Brighton), 43 gs. for a gelding, twelve years; Mr. W. Smith (Lewes),

51 gs. for a mare four years, and Mr. Botting 26½ gs. for a black cob.

MR. GIRLING'S SUFFOLK CATTLE AT RENDHAM ROOKERY.—Of the several tribes the following were sold: Gloss, V11, five years old, Mr. R. E. Lofft, 31½ guineas; Penguin, V11, three years old, Mr. Patrick, 28½ guineas; Kitty, V11, nine years old, Mr. D. Burrows, 29 guineas; a heifer-calf, 6½ guineas, Mr. Burrows; and a year-old bull, Young Mouch (246), Mr. W. Toller, 16½ guineas; Grimace 3rd, V10, five years old, Mr. Patrick, 28 guineas; Grace 4th, V10, a yearling heifer, Mr. Toller, 9 guineas; Glee 2nd, V9, five years old, Mr. Patrick, 29 guineas; and a yearling heifer, Mr. Woods, of Martlesham, 17 guineas. Glad, the granddam of Glee 2nd, sold for 16 guineas, Mr. Smith, the purchaser; Gambol 3rd, V8, went for 26½ guineas to Mr. Winter; Gaiety, V8, a yearling heifer of the same tribe, for 11½ guineas, Mr. Patrick, purchaser; and a heifer-calf from Gambol 3rd, for 8 guineas, Lord Sondes, the purchaser. Mr. Woods gave 17 guineas for Prince (244), a Gambol bull. Mr. Patrick also bought a three-year-old heifer, Lady Rowley, for 23 guineas, and her yearling heifer for 14½ guineas; her heifer-calf went to Mr. Burrows for 5 guineas. Mr. Allen was the purchaser, at 23 guineas, of Glitcham, a three-year-old heifer, and of Cherry, an eight-year-old cow, at 24½ guineas. Lord Sondes bought at 4 guineas a bull-calf from Cherry, and Mr. P. A. Damaunt at 7½ guineas, a bull-calf from Penguin V11. The first four cows offered averaged upwards of £30, six others £26, including one purchased by Mr. R. E. Lofft at 31½ gs. The year-old bulls realised £17 10s. each. The yearling heifers averaged £11 15s., and the young calves £6 4s.

THE SUSSEX HERD AND SOUTHDOWN FLOCK, AT COURT LODGE, CROWHURST.—The herd numbered about 50 head, and the Southdown flock 350. The sale took place by direction of the trustees under the will of the late Mr. B. Larkin, of Court Lodge Farm, Crowhurst, Battle. Two-tooth ewes (six lots of 10), Mr. T. Wood (Sidley) bought at 60s., Mr. D. Noakes (Pett) at 49s., Mr. Bradford (Charleston) at 45s. (three lots), and Mr. Newman (Eastbourne) 45s.; four-tooth ewes (from lots of 10 and one of 13), Mr. G. Shorter (Pembury), bought at 57s. and 54s., Mr. Noakes at 55s., and Mr. Withersden at 51s. and 48s.; six-tooth ewes (three lots of 10 and one of 13), Mr. Hayler (the in-coming tenant), bought at 56s., 47s., and 46s., and Mr. C. Mannington (Battle) at 45s.; mid-mouthed ewes (nine lots of 10 and one of 13), Mr. Hayler bought at 44s., 43s., 41s., 40s. (two lots), and 35s., Mr. James Wren at 44s., Mr. Simmoos (Cowden) at 44s., Mr. Marmer Rosehill at 43s., and Mr. Bratt (Bexhill) at 39s., Mr. Tompsett (Hollington) bought one lot of 10 broken-mouthed ewes at 31s.; ewe lambs (one lot of 10 and three of 20), Mr. G. Shorter purchased at 28s., Mr. Wood (Westfield) at 23s. and 22s. (two lots); ram tegs, Mr. Bradford bought at £5 15s., Mr. G. Kenward at £5 5s., Mr. W. Thomas at £4 5s., Mr. Pocock at £3 5s., Mr. Noakes at £2 12s. 6d., and Mr. Christmas at £2; ram lambs, Mr. Brett bought at 44s., Mr. Robinson (Kelsey) at 33s., Mr. Hayler at 30s. and 25s., and Mr. Newington (Battle) at 30s. For Sussex cattle the highest prices were for cows—21, 24, and 31 guineas. Two-year-old heifer in calf, Mr. C. Mannington, 23gs.; ditto, Mr. Howard, Mill-house, Crowhurst, 23gs. For steers, as follows: Pair of two-year-old steers, Mr. C. Lawrence, Battle, 50gs.; ditto, Mr. C. Lawrence, 40 gs.

HEXHAM RAM SALE, Oct. 6.—Leicester shearlings and aged rams: Messrs. Snowball, Hedley Grange, three £5 17s. 6d.; John Sturtees, Stamfordham, two, £2 10s.; Ralph Cowing, Low Morley, nine, £4 15s.; Messrs. Atkinson, Bywell Hall Farm, thirty, £6 2s. 6d.; John Annandale and Sons, Lintz Ford, thirteen, £8; A. Wood, Broxbrushes, twenty, £9 5s.; T. Barron, Hexham, fourteen (unfed), £4 15s.; Wm. Lambert, Erlington Hall, seven (part unfed), £7; Thomas Bulman, Hexham, five, £5 5s.; James and Robert Telfer, Donkley Wood, four, £3 2s. 6d.; the executors of the late G. Angus, Broomeley, twelve, £11 15s.; W. Cuthbert, Beanfront Castle, two, £4 5s.; Geo. M. Angus, Matten, High House, one, £6; Thomas Telfer, Green Carts, five, £5; Messrs. Dinning, Nilston Bridge, twenty-two, £11; G. T. Dickinson, Esq., Wheelburks, one, £3 10s.; Wm. White, Harsondale, one, £5; William Glendinning, Swinburne Hermitage, two, £2 12s. 6d.; Wm. Charlton, Linnel Wood, one, £2 12s. 6d.; Thomas White Hedley, one, £7 15s.; John Stoke, Summer-roads, one, £4 12s. 6d.; J. S. Young, Breckon Hill, three, £4 10s.; Scott Nichol, Whitfield one, £4 2s. 6d.; John

Berwick, Prior House, one, £2 5s.; A. Hunter, Haydon Bridge, one, £3; T. Pickering, Ellfoot House, one, £3 15s. Leicester ram lambs: Mr. Eshton, Chesterwood, two, £2 2s. 6d.; Thomas White Hedley, West Ryton, five, £2 17s. 6d.; Thomas Pickering, Ellioth House, nine, £2 12s. 6d.; George Ellison, Lead Hill, Stocksfield, six, £2 15s.; J. and R. Teller, Donkey Wood, two, £1 17s. 6d.; H. Carr, Slaley Strothers, two, £2 12s. 6d.; T. Dickinson, Low Gate, one, £2 2s. 6d.; R. Bell, New Rift, two, £2 12s. 6d.; W. Charlton, Linnel Wood, four, £1 15s.; G. T. Dickinson, Wheelbirks, eight, £3 12s. 6d.; Messrs. Snowball, Hedley Grange, five, £3; J. B. Lee, Stocksfield Hall, twelve, £2 5s.; J. Stokoe, Summer-roads, four, £2 15s.; George M. Angus, Maffen High House, five, £5; Thomas Rowell, Slaley, three, £3; C. and T. Richardson, New Ridley, ten, £4. Leicester ewes and gimmers: Messrs. Dinning, Nilstone Ridge, five, £6 12s. 6d.; Thomas Barron, Hexham, fourteen, £2 17s. 6d.; Thomas Bulman, Hexham, six, £3 2s. 6d.; Messrs. Atkinson (including eight Shropshire gimmers), eighteen, £2 12s. 6d. Shropshires: Executors of G. Angus, Broomley, twenty-two, £3; J. and R. Teller, Donkey Wood, ten, £2 15s.; Thomas Dickinson, Low Gate, one, £2; Mr. Cook, Hexham, two, £3; McAllum, Oakerland, eleven, £2 12s. 6d.; Jasper Stephenson, Newbiggen House, fifteen, £3. Black-faced rams: Scot Nichol, Agars Hill, Whitfield, five, £2; A. Johnstone, High Aydey, one, £2. These sales were conducted by Mr. W. Cook.

ROTHBURY SHEEP SALE, Oct. 5.—The total amount realised was £8,936 3s. 6d. Fat sheep and lambs; Meldon, twenty, 37s. to 38s. 6d.; Ryehill, ten, 45s.; Yetlington, ten, 40s.; Row, six, 27s.; Nnoeklaw, four, 32s.; Scrainwood, thirteen, 18s.; Thrunton Low Field, ten, 38s. 6d.; Holystone, twenty, 30s.; Woodhouse, eight, 14s. to 28s.; Long Lee, five, 32s. 6d.; Burradon, forty, 42s. 6d. to 43s. 6d.; Easington Hill, twenty, 20s. to 32s. 6d.; Carlington, twenty, 32s. to 41s.; Blagdon Burn, four, 26s. 6d.; Snitter, six, 41s.; Overthwarts, ten, 36s.; Framlington, ten, 33s. to 39s.; Caterside, fat lambs, twenty, 32s.; Holystone, ten, 11s. to 15s.; Lee, two, 22s. 6d.; Longhorsley Birks, four, 20s.; Linden, five, 24s.; North Tyne, thirty, 23s. to 29s. 6d.; Thropton, twelve, 17s. 6d.; Carr, eight, 22s. 6d. Wethers: Ingram "Pack," fifteen, 38s.; Hazelton Rig, twenty-seven, 30s. to 31s.; Clennell, thirteen, 27s.; Long Edlingham, thirteen, 36s. to 76s. Tups: Hindhope Cheviots, eight, 61s. 10d. to 105s.; Alnham, eight, 37s.; Blagdon Burn, three, 40s. Pigs: Rothbury Hotel, three, 60s. Draft ewes—Border Leicester ewes: Illeburn Hill, forty-five, 44s.; Roseden, eighty, 36s.; Snitter, fifty, 50s.; Wooler Hangh Head, three, 45s. Three parts and half-bred ewes and gimmers: Brockley Hall, half-bred, forty-five, 45s. 6d.; Lee, half-bred, forty, 33s. 3d.; Faraham, three-parts bred, thirty-three, 46s. 6d. to 47s.; Trewit Demesne, three parts and half-bred, six, 40s. 6d. to 46s.; Low Trewlitt, three-parts and half-bred, eighty, 41s. to 47s. 6d.; Rosebrough, half-bred, one hundred and twenty, 37s. 6d. to 39s. 6d.; Lorbotle, three-parts and half-bred, one hundred and forty, 42s. to 46s.; Crosshill, three-parts and half-bred, part gimmers, forty, 34s. to 38s. 6d.; Great Ryle, half-bred, fifty, 44s. 6d.; Biddleston, half-bred, thirty, 37s.; Netherwitton, half-bred, forty, 33s.; Colt Park, half-bred, gimmers, thirty, 38s.; Roughlees, half-bred, seven, 38s. 6d.; Ewesley, half-bred, thirty, 41s.; Yetlington, three-parts bred, forty, 41s. 6d.; Titlington Mount, half-bred, one hundred and forty, 33s. to 41. 6d.; Meldon, half-bred, twenty, 36s. 6d.; Thrunton Low Field, half-bred, forty, 43s.; Rothbury Brewery, forty-five, 45s.; Ryehill, three-parts bred, twenty-three, 44s.; Roseden, half-bred, forty-seven, 35s.; Clifton, half-bred, one hundred and twenty, 34s. to 36s.; Darlingfield, half-bred, eighty, 29s. 6d.; Akeld, half-bred, one hundred and eighty-six, 26s. 6d.; Longhorsley Birks, half-bred gimmers, 30s., 34s.; Kirkhall, half-bred, thirty, 40s. 6d.; Holtinghill, half-bred, thirty-five, 37s. 6d.; Burradon, half-bred, forty, 36s.; Burradon, half-bred, forty-four, 37s.; Brinkburn, half-bred, twenty, 42s.; Titlington, half-bred, sixty, 40s. 6d., 40s., 37s.; Thirs-ton, half-bred, ten, 35s. 6d.; Longlee, half-bred, ten, 24s. 6d.; Lorbotle Steads, half-bred, fifteen, 32s., 35s., 25s.; Thorney-hangh, half-bred, fifteen, 45s.; Fawdon "Packs" half-bred, twenty, 35s.; Brandon "Packs," half-bred, six, 42s.; Roddam "Packs," half-bred, nine, 39s. 6d.; Newton "Packs," half-bred, twelve, 25s.; Alnham "Packs" half-bred, seven, 46s., 39s.; Whittingham, three-parts bred, five, 40s.; Broom Park, half-bred, seven, 41s.; Follions, half-bred gimmers, ten, 30s.;

Holystone, half-bred, twelve, 21s.; Barnhill, half-bred gimmers, forty, 35s.; Todburn, half-bred gimmers, forty, 32s.; Nunriding, half-bred gimmers, twenty, 40s.; Linden, half-bred gimmers, thirty, 40s.; Unthank, half-bred, thirty-five, 31s.; Elilaw, half-bred, forty, 30s., 24s. 6d.; Caistron, three-parts bred, twenty, 44s. 6d.; Whittingham, three-parts bred, twenty-four, 38s.; Shawdon, half-bred, forty, 46s. 6d., 43s.; Overthwarts, half-bred, fifteen, 38s.; Flotterton, half-bred, gimmers, thirty, 26s.; Middleton, half-bred, six, 42s. Cheviot ewes: Ingram, two hundred and thirty-five, 27s., 28s. 6d., 14s. 6d., 26s.; Alnham, three hundred and twenty, 30s., 29s., 28s., 27s. 6d., 27s. 6d.; Fawdon, two hundred and three, 23s., 22s. 6d.; Alnham Moor, one hundred, 31s.; Ilderton Dod, one hundred and thirty, 27s., 26s., 27s. 6d., 17s.; Woolen Common, one hundred and three, 20s.; Kirknewton, eighty, 23s., 22s., 23s. 6d., 15s.; Newbiggin, sixty, 24s. 6d.; Pike, forty 20s. 6d. Messrs. Dunkin and Son conducted the sale.

EWES AT BRAMPTON.—The large annual sale of draught ewes from Tarn House and Geitsdale took place on Wednesday on Brampton Sands. About 800 sheep were presented and disposed of in three hours, there being a large attendance of ready buyers. The following is the quotation of some of the prices: Cheviot ewes from 25s. to 31s. per head, averaging 28s. 6d.; black-faced ewes, the average was 20s. 3d.; and a few Cheviot ewes were sold for 36s. each.

SHROPSHIRE SHEEP.—There was a sale of Shropshires at Shrewsbury on Monday. Several rams were bought for exportation. Mr. Minton, of Forton, obtained 32 guineas for a ram; Mr. Crane, of Shrawardine, 38 guineas for one and 16 guineas for another; Mr. Thomas Baschurch, 25 guineas and 20 guineas; Mr. Evans, Uffington, 13 guineas and 12 guineas; Lord Leigh, Kenilworth, 24 guineas; Mr. Nock, Shiffnall, 20 guineas; and Mr. Wainman, Newport (Salop), 19 guineas and 13 guineas. Mr. R. Wyatt, of Acton Hill, Stafford, sold ram lambs at £8, £4 10s., and £4. A pen of prize ewes of Mr. Wyatt's realised £6 10s. each. Mr. Pickering, Halston, sold two pens at £5 each, and one at £4 5s. Mr. E. Crane sold a pen at £4 16s., and another at £4 9s. per head. Mr. Preece was the auctioneer.

SIR G. JENKINSON'S STOCK AT EASTWOOD PARK.—Ten lots of ten each of wether lambs, by Cotswold rams, out of Shropshire Down ewes, made a total of 1175 10s.; ten lots of ten (Chilver lambs) £157 15s., and 17 steers and fat cows and heifers made up the total of the sale to £823 5s.

MR. FROUDE'S, AT STOCKLEIGH, DEVON.—The sheep offered comprised 114 store ewes, 70 ewe hogzgs, 61 wethers, 111 ewe and wether lambs, and 5 rams. The ewes fetched from two guineas to 55s. a piece, the wethers about 50s., the ewe lambs from £1 6d. to £1 14s. each, the wether ditto from £1 1s. to £1 18s. The rams sold at from £2 17s. to £3 6s. a piece. Two fat sows realised £6 10s. and £6 6s. respectively, and a barnerer was sold for £4. Two yearling heifers made £22 and £21 respectively. A Molland cow, one of Halse's breed, fetched £15 10s., a Jersey £11, and a Guernsey £19 10s. A large number of heifers were next offered. One three-year-old Down fetched £25, and three Appledore heifers realised £19, £18, and £17 10s., while another was sold for £15. The remainder realised from £8 to £10 a piece. The steers were sold in pairs. The first pair, two-year-old ones, were sold at £23, and the others at £21 10s., £20 5s., and £19 a pair. One steer was disposed of by itself for £12. A Guernsey calf fetched £8 5s., a heifer £5, and two heifer-calves, put up together, made £14 5s. A Devon hull, 16 months old, bred by Mr. Bowcher, was sold for £29 10s. A collection of agricultural horses came next, with hunters and hacks, several of them prize animals. A cart mare, Violet, was sold for 45 guineas. A grey mare was knocked down at 41 guineas. A young cart mare realised 50 guineas, and all the cart-horses fetched over 50 guineas each, the highest price realised being 58 guineas.

THE MARQUIS OF ALLESBURY'S STOCK.—The sale occupied two days, and attracted a large assemblage of leading agriculturists. The Hampshire Downs fetched good prices. A lot of six-teeth ewes sold for 70s. per head, and out of several lots of similar age the lowest price was 45s. per head. The four-tooth ewes were the best lot, realising 81s. per head, and others 75s., 61s., and 58s. The two-teeth ewes started at 80s. per head, and ranged downwards to 47s. The best of the Chilver lambs fetched 63s., 61s., and 58s. per head, whilst the wether lambs sold at from 58s. to 47s. per

head. The cart horses brought good figures, a mare fetching 75 gs., and others 67 gs. and 64 gs. A good-looking horse, 24 years old, sold for 54 gs. Two two-year-old colts sold for 51 gs. and 42 gs. respectively. The Shorthorns originated in a cow, Violet, by Mazeppa, bought by Lord Ailesbury 18 years since at the sale of the herd of the late Mr. Hurwood, of Thirsk, Yorkshire. The best animals realised from 50 gs. down to £35, but the majority sold at between 40 gs. and 50 gs. The yearlings sold at from 24 gs. to 14 gs., and the heifer-calves from 23 gs. to 11 gs. The Berkshire pigs came from a stock that has obtained much celebrity, breeding sows

realising 10 gs., pairs of young sows 10 gs., and a young boar 12 gs. Messrs. Marsh and Dawes, of Devizes, were the auctioneers.

MR. DUNN'S SALE AT INLEASE, NEWBURN.—The Hampshire full-mouthed ewes sold at figures varying from 27s. to 41s. 6d. per head; 66 four-tooth ewes, 32s. to 41s.; 68 ewe tegs, 37s. to 41s. 6d.; 32 wether tegs, 42s. to 43s.; 129 ewe lambs, 21s. 6d. to 34s.; 81 wether lambs, 21s. to 30s. 6d.; rams, 45s. 6d. to 63s. A herd of well-bred Shorthorns made only a moderate average.

REVIEW OF THE CATTLE TRADE DURING THE PAST MONTH.

Nothing of importance has transpired in the cattle trade during the past month. The supplies of beasts from our own grazing districts have been tolerably good, but the quality, although showing an improvement compared with the previous month, has been various. The condition of the Lincolnshire stock has, on the whole, been satisfactory, but the quality of the receipts from miscellaneous quarters has been rather diversified. Scotland has contributed more liberally than usual at this season of the year, and the appearance of the stock has been good. From Ireland a large number has come to hand, principally cows. The foreign receipts have been on a full average scale, chiefly from Tonning. Some of the animals have been of good quality. As regards trade, a moderate amount of animation has prevailed, and the general top quotation for the best Scots and crosses has been 6s. 2d. to 6s. 4d. per 8 lbs.

The sheep pens have been fairly supplied. The condition of the English stock has been mostly good, and that of the foreign has improved. Although not active, the trade has, on the whole, presented a fine appearance, and prices have been steady. For the best downs and half-breeds 5s. 8d. to 5s. 10d. per 8 lbs. has been paid.

As regards calves, the trade has been alternately steady and depressed. At one time the top price did not exceed 5s. per 8 lbs., but it has since risen to 6s.

Pigs have been quiet, and without feature.

The total imports of foreign stock into London last month were as under:

Beasts	12,919
Sheep	48,769
Calves	1,994
Pigs	3,036

COMPARISON OF IMPORTS.

Oct.	Beasts.	Sheep.	Calves.	Pigs.
1873	12,397	48,690	2,465	3,465
1872	11,694	47,906	916	820
1871	13,606	47,933	1,532	2,660
1870	16,598	42,584	3,035	3,370
1869	11,496	28,282	2,365	1,902
1868	12,714	17,891	962	1,948
1867	13,061	29,265	957	2,911
1866	15,876	30,108	1,578	4,859
1865	15,344	69,611	1,952	9,135
1864	16,074	38,715	3,339	5,537
1863	11,563	37,521	1,129	2,965
1862	7,906	28,109	1,327	1,600
1861	5,577	42,538	1,207	5,315
1060	6,750	24,980	1,662	2,074
1859	6,026	24,323	784	878
1858	4,600	24,145	1,581	553

The arrivals of beasts from our own grazing districts, as well as from Scotland and Ireland, thus compare with the four previous years:

	Oct. 1870.	Oct. 1871.	Oct. 1872.	Oct. 1873.	Oct. 1874.
From Lincolnshire, Leicestershire, & Northamptonshire	8,690	6,200	9,300	11,520	8,540
Other parts of England, including Norfolk and Suffolk	2,200	1,100	1,560	4,720	1,800
Scotland	625	25	308	14	469
Ireland	1,300	350	1,740	1,000	2,000

The total supplies of stock exhibited and sold in the Metropolitan Cattle Market during the month have been as under:

Beasts	27,170
Sheep	111,240
Calves	2,945
Pigs	480

COMPARISON OF SUPPLIES.

Oct.	Beasts.	Sheep.	Calves.	Pigs.
1873	33,270	112,910	3,450	1,480
1872	22,906	116,000	1,500	1,000
1871	23,415	116,330	2,011	970

REVIEW OF THE CORN TRADE DURING THE PAST MONTH.

The weather of October has been very variable, there having been much rain, producing floods in the North, while a tremendous gale blew on the third week, occasioning very serious disasters. We have had some cold also, and a few light frosts, but generally mildness has been the rule, and all vegetation has been making nearly a spring progress, as the greenness of the meadows and the revival of the esculents have testified. The previous drought has therefore made the rain of great benefit, and little or no hindrance has been felt in the work of autumnal sowing and the labours of the land. The young wheat now up may, however, yet become winter-proud, though everywhere hitherto it has gone on well. Prices have by no means recovered the shock they felt on the gathering of the last crop, English qualities having further yielded about 2s., with only moderate supplies in London, and foreign fully 3s., from the continued heavy arrivals and prospective imports, while the failure of a large house in the foreign trade towards the month's close greatly added to the dullness felt. It is true on the part of growers we have some signs of resistance to unremunerative rates, as seen practically by the weekly sales, for October this year, after a better crop, only sums up 263,807 quarters as the whole, when 1873, a really deficient crop, reported sales of 287,453 quarters. The difference certainly is not great, but the circumstances make it worthy of note, and if foreign importers were equally careful not to overdo the market there would be some chance of amelioration as to prices. But perhaps the most certain, though gradual, way to effect this, is more largely to employ the use of low-quality wheat for cattle-feed, as all spring corn of home-growth is literally dearer, and Europe has not yet conformed to English quotations. France and Belgium have lately been rather looking up, and in Hungary large growers are so dissatisfied with present rates that they send to market only enough for home consumption. Danzig has picked up a little; but in Southern Russia, where the crops have been unequal, those who are well off are availing themselves of every means of transit before winter sets in to get off what they can. While American rates keep low, and with the present crop equal to the last, wheat is sure to be largely used for export if rates become more encouraging. The following prices were last quoted at the several places named: Wheat at Paris 43s. to 49s. 9d. for native sorts, white at Bordeaux 50s., Berdianski at Marseilles 47s., Ghirka 48s., red Riehelle 50s. per qr. Wheat at Bruges 46s., at Liege and Brussels 48s., at Louvain 49s., at Maestrecht 46s., at Amsterdam 42s., at Hamburg, cost, freight, and insurance; 49s., fine at Danzig 50s. to 54s., cost, freight, and insurance; Mayence 46s. 6d., free on board; Cologne 45s., Berlin 40s., Pesth 45s., Odessa 38s. per qr.; New York, red spring, per qr. of 480 lbs., 36s. 1d., free on board; San Francisco 45s., cost, freight, and insurance.

The first Monday in Mark-laue opened on a moderate quantity of home-grown wheat and a fair arrival from abroad, about half being American. The show of fresh samples from the near counties was limited, yet the trade was extremely dull, and, not finding buyers at previous rates, factors were obliged towards the close of the day to accept a decline of 1s. per qr. to make a clearance. In foreign there was a moderate retail trade for fine parcels of old, at former rates, but new were occasionally

sold at less money. There was but a limited inquiry for cargoes afloat, without change of values. Town advices continued the dull feeling in the country wheat trade, but several places made no change. Such was the case at Leeds, Gainsborough, Sheffield, Rotherham, Thirsk, &c. Some noted a downward tendency, as Alford, Birmingham, Louth, Lynn, Manchester, Newcastle, &c., but Hull was 1s. lower, and a decline of 1s. to 2s. was noted at St. Ives and Market-Rasen. Liverpool was unaltered, both on Tuesday and Friday. Glasgow was 6d. lower for wheat, and Leith 1s., but a demand for seed at Edinburgh kept up prices. Dublin found but a slow sale for Irish qualities, yet a steady demand existed for foreign, at unaltered rates.

On the second Monday there was a fair supply of English wheat, and the quantity of foreign was nearly double, three-fourths being American, and the remainder from Russia. The exhibition of English samples this morning was small, and a firmer feeling was apparent in response to the country markets of Saturday, but no advance was realised, neither was there any activity in the demand, so much foreign being on offer. A retail demand for this latter obtained at previous rates for red sorts, and fine white occasionally obtained 1s. advance. Though but few floating cargoes were on the market, prices were in buyers' favour. The features of the wheat trade in the country were a stoppage in any further decline, while a rise of 1s. was reported at Brigg, Louth, Melton Mowbray, Manchester, &c. Liverpool was firm at both markets, Friday's being rather dearer for red American. Leith was again reported 1s. cheaper, and Glasgow 6d. to 1s., but Edinburgh only continued dull. A demand for Irish wheat was experienced at Dublin, but foreign was less in request, though unaltered in value.

On the third Monday the English supply was about the usual average, and the foreign plentiful, though rather less than the week previous. The fresh samples of English growth were not numerous yet there was but a quiet trade, at the previous rates. Old foreign went off steadily at the former currency but new American was rather in buyers' favour where pressed ex ship. Though the number of floating cargoes was limited, prices were unchanged. The wheat trade this week in the country was steady with very little alteration, and that upward in its tendency, and at Hull, Rotherham, Thirsk, &c., it was 1s. dearer. Liverpool on Tuesday noted an improvement of 1d. to 2d. per cental on fine qualities. On Friday the market was the same. The wheat trade at Edinburgh was dull but not lower. Glasgow found but a slow sale. At Aberdeen no wheat was offered. Dublin found but a limited inquiry for native wheat, and Black Sea qualities gave way 6d. per barrel.

On the fourth Monday the English supplies were somewhat lessened, but the foreign were largely increased; chiefly from Russia and America, with a free scattering from various ports. Not many fresh samples were exhibited during the morning on the English stands, and the dampness of the weather had rather affected the condition. Business was excessively dull and sales could only be made by a concession of 1s. per qr., a heavy failure in the foreign trade having almost paralysed the market. New American red was quite as much lower and to sell generally it was necessary to make the same reduction. Floating cargoes also, though not numerous, tended downwards.

The arrivals in London for four weeks were 29,544 qrs. English wheat, 164,487 qrs. foreign, against 26,026 qrs. English, 194,619 qrs. foreign in 1873. The arrivals into the kingdom for the four weeks ending 17th October were 3,397,940 cwt. wheat, 336,424 cwt. flour, against 3,296,174 cwt. wheat, 505,114 cwt. flour in 1873. The London exports were 4,493 qrs., against 18,167 qrs. in 1873. The London averages commenced at 47s. 7d., and closed at 47s. 3d. The general averages opened at 46s. 9d., and finished at 43s. 10d.

The flour trade has ruled dull and declining, but the first Monday was the worst, when town millers let down the top price 4s., making it 43s. per sack; while country descriptions were 1s. to 2s. lower, and foreign also about 1s. per sack and barrel. Since then there has been no rally, but prices have not been further reduced, Nortolks being worth 31s., and barrels 24s. 6d. to 25s. 6d. for mixing, but the finest qualities in Paris were not worth over 37s. per sack, and at New York extra State barrels were only quoted 20s. 1d.

The receipts of maize have been extremely light, but grinding barley being very abundant and seriously declining, it was impossible that this grain, though scarce, could maintain its price, and it has given way 1s. 6d. per qr., best mixed American not being worth over 35s., and round 36s. 6d. The arrivals into London for four weeks were 10,078 qrs., against 46,647 qrs. in 1873.

The arrivals of malting barley of home growth have been gradually increasing, but so small has been the proportion of fine that it has about maintained its price, say 45s. to 48s., but secondary French has given way 5s., and grinding sorts, from the Black Sea especially, have continued so abundant that it has been down 1s. per qr. every Monday's market, till rates are now lower than oats, say 25s. per qr., at 50lbs. per bushel; and as large shipments are still on their way, we see nothing to revive the trade, but rather a further decline, unless it should enter largely into consumption for horse-food as a substitute for oats, though lately there has been some foreign inquiry. The supplies of all sorts for London were 14,599 qrs. English, 131,392 qrs. foreign, against 15,857 qrs. English, 69,882 qrs. foreign in 1873.

The malt trade, with more new samples showing, has ruled dull, and rather cheaper for inferior qualities, though fine old has about maintained its price.

The supplies of foreign oats during the four weeks were fair, but scarcely more than half the arrivals in September; the surplus, however, of that time has kept prices quiet, and indeed on the first Monday there was a decline of 6d., which now seems likely to be soon cancelled, as the final Monday was short of an average. Rates, therefore, have been little changed since our last, and we cannot look for much reduction, as all over the Continent the drought was felt and sent up the value of this grain. The London receipts for four weeks were 4,750 qrs. English, 395 qrs. Scotch, 165,144 qrs. foreign, against 10,718 qrs. English, 790 qrs. Scotch, 722 qrs. Irish, 121,178 qrs. foreign for the same time in 1873.

The tendency of beans has certainly been upwards, but they have been kept from rising by the increased arrivals from abroad, though little can be expected from Egypt, and none from Morocco, from whence there is a prohibition to exports. The London supplies in four weeks were 4,442 qrs. English, 9,491 qrs. foreign, against 4,343 qrs. English, 9,013 qrs. foreign in 1873.

The supplies of English peas have only been moderate, and the foreign arrivals short, but the plentifulness of low barley has limited the demand for hog feed, and the warm weather has been 1s. against white boilers. The imports into London for four weeks were 4,469 qrs. English, 1,213 qrs. foreign, against 3,527 qrs. English, 1,595 qrs. foreign in 1873.

With moderate arrivals of linseed, this grain, without any stir, has kept its value. Receipts 15,551 qrs., against 24,557 qrs. in 1873.

With the belief in a poor crop of cloverseed holders of the small stock on hand were not willing to part with it on rates easy enough to satisfy speculators; so scarcely anything has been doing. Winter tares also have maintained their value—say 9s. per bushel.

PLATE.

A P R I Z E L E I C E S T E R :

THE PROPERTY OF MR. T. H. HUTCHINSON, OF MANOR HOUSE, CATTERICK.

This ram, now a two-shear, bred by Mr. Hutchinson, and known as Prince Charlie, is by Borton's Blair Athol, a Royal and All-Yorkshire first-prize sheep, out of a ewe from the Barton flock, also by a Royal ram.

In 1873, as a shearling, Prince Charlie took first prizes at the following shows: Doncaster, Ripon, Driffield, Crook, Thirsk, The Highland Society, Royal North Lancashire (Chorley), Keighley, Durham County, Richmondshire, Manchester and Liverpool (Chester), Northallerton, Barnard Castle, and Wetherby. In 1874 he was second at Doncaster, and first at Ripon, Malton, Driffield, Bishop Auckland, Durham County, Manchester and Liverpool (Staleybridge), Northallerton, Wetherby, and first at the Yorkshire Show at Sheffield, beating, amongst others, the second and third Royal sheep, thus making a total of 23 first prizes.

Last season this ram was used at home, although many tempting offers had been refused for his hire. This year he has been, with two others, let to Mr. James Hall, of Seorbro, master of the Holderness hounds,

one of the best judges of a Leicester in England and the largest ram-breeder in Yorkshire. Prince Charlie has brought his owner upwards of £220 in prizes, exclusive of his services in 1873. His half-brother was sold last year with another shearling to the Hon. C. Sladen, Green Vale, Victoria, for 200 gs.; while his dam has bred sheep which have made upwards of £500 in prizes and letting. Mr. Hutchinson's Leicesters have become great favourites with foreigners, and of late years many have been shipped to Australia, New Zealand, Canada, Holland, Belgium, France, and Germany. During the last two years sheep from the Manor House flock have gained upwards of 100 prizes, and won £443 13s. in the principal show-yards of England. At Bedford we spoke of the Catterick ewes as a very neat, uniform lot, symmetrical in their frames and of good thoroughbred character; while Prince Charlie is quite a prize sheep, what with his blood-like head, thick neck, wide loins, long hind-quarters, capital thighs, and bold carriage, backed by a heavy fleece of fine quality.

THE OPENING OF THE WINTER SESSION IN LONDON.

Rarely in the memory of man has there been so delightful or, at the same time, so dreary an autumn. The agricultural labourer has much to answer for, as he has overlaid alike rural gatherings and learned disquisitions; and if ever a topic were talked out, it has been his "condition." At the Farmers' Club, indeed, on the Monday evening Mr. James Howard fairly apologised for once more bringing such a thing forward. Had he foreseen how, morning after morning, special commissioners would have been giving "graphic accounts of village life," Mr. Howard himself might have shrunk from the subject. But the Club lecturer might have gone yet further when speaking to the way in which he had been anticipated. The landlords and county members have pretty generally taken refuge here; merely glancing at other agricultural questions, they have grown eloquent over the labour difficulty, as they counselled mutual concessions between master and servant. The squire, however, has found that it would not do to stop short at this point, but has commonly gone on to admit his share in the adjustment, and to speak to the necessity for more care being given to cottage accommodation and home comforts. In a word, the sanitary reform of our villages come as well-timed as many of the subjects at The Farmers' Club frequently fall, and the discussion cannot but do good, the more especially perhaps

through the examples cited from Bedfordshire, Buckinghamshire, and Oxfordshire. Landowners will learn to show not merely their stables, their kennels and their homesteads, but their cottages; as, on the other hand, the labourer will himself be required to look a little more carefully to his own condition. There is no doubt but country folks have something like an indifference to the enjoyment of such blessings as fresh water and pure air; and the tenour of the discussion on Monday went to show that the villager himself was but too often an obstacle to the sanitary reform of OUR VILLAGE, as dear Miss Mitford wrote it long before the dawn of Mr. Howard. Coming from the quarter it did, all the main features were sketched in the opening paper; but the debate threatened to get wild at the very outset, as with Mr. Hope the very mention of sewage—

That well-known name awakens all his woes.

And it was only a thoroughly practical speech from Mr. Treadwell that diverted the discourse again into its proper channel. We give a full report "upon authority," the day's proceedings being pointed by a very popular appointment—that of Dr. Voelcker to the Chairmanship of the Club for 1875, upon which we shall ask our contemporary, *The*

Agricultural Gazette, to say more: "The London Farmers' Club have elected Dr. Augustus Voelcker, F.R.S., as their President for the coming year. Proving both life and vigour by stepping thus boldly out of the field from which their selections have hitherto been made, they have done honour both to themselves and to the scientific side of agriculture by a choice which will certainly bring into prominence, during their ensuing session, the importance of the agricultural aids which are offered by the student of science." In fact, the Committee may be congratulated on carrying out the motto of a kindred society, and strengthening the union between SCIENCE AND PRACTICE.

At the meeting of the Council of this said Society in Hanover-square on Wednesday, a very strong feeling was expressed as to the desirability of breaking through the bonds of the charter, which, as Mr. Holland, the ex-president, well said, "was more than a quarter of a century old, and since it was granted times and feelings had changed." Lord Lichfield, however, as the moving spirit, broached a resolution which should "bring members of the Council into more frequent communication with members of the Society," and permit the discussion of "measures of a practical agricultural nature, although pending or to be brought forward in either of the Houses of Parliament." And as all this was carried unanimously the shades of Colonel Challoner and Mr. Raymond Barker will surely shudder at such astounding revolutions. Then, Lord Cathcart went so far as to characterise the general meetings as "shams"—as shams they will continue to be if the proceedings are not considered worth reporting, an omission which we have already dwelt on in our notice of the new number of the Society's *Journal*. However, the demonstration at Bedford has already been attended with other good effects, as a large proportion of the judges for the next Smithfield Club show, as appointed during the week, are new men. "Times," as Mr. Holland has it, "have changed" here also since they rang the changes of Steward and Judge, and Judge and Steward over each others' heads.

"The consideration of reform in Local Government will continue to demand the care and investigation of the Local Taxation Committee. The irregularity of existing divisions, the confusion of jurisdiction, and the multiplication of authorities are all evils for which a remedy is urgently demanded. A proper classification of local and imperial duties should, in their opinion, be followed by careful inquiry as to the areas, constitution, and duties of the local governing bodies, so as to ensure not only *efficient representation to the local taxpayer*,

but wise and economic administration. The promises of the Chancellor of the Exchequer with reference to the possibility of ultimately handing over to *local authorities* some branch of the general revenue will have to be steadfastly kept in view." So says the annual report of the Local Taxation Committee of the Central Chamber of Agriculture, as just issued; and if this be really intended to mean anything, it must mean a movement for the establishment of County Boards, already foreshadowed by Mr. Sewell Read. Accordingly, at the meeting of the Chamber, on Tuesday, the very mention of County Boards, so far as we can see, was carefully avoided; while the Council appeared to be quite at sea as to any other system of administration. Thus, the Business Committee in their No. 6 resolution proposed that all roads should be "under the management of Highway Boards," but these words were omitted when the resolution was put before the full meeting, and, on being replaced through an amendment, were again struck out by 14 to 13. The divisions, in truth, were close and continual, as the report, which we give with something of an apology for so doing, will show. This, however, can convey no proper notion of the hopeless muddle and utter confusion of the proceedings; as a contemporary, who perhaps with more discretion cut it down, says, "to every resolution nearly every person spoke twice, and several three and four times. The resolutions were in no case put until the entire patience of the meeting was gone, and the room resounded with cries of *Divide—for pity's sake, divide*." We prefer to quote thus much, as our own opinion of the administrative ability displayed by the Council of the Central Chamber of Agriculture has long been known. Such agricultural exhibitions are happily not common.

As we intimated some months since, the Shorthorn Committee has been unable to come to terms for the purchase of *The Herd Book* from Mr. Strafford, who insisted on appointing his successor as editor, although the person named by him declined to act on such nomination. It is still satisfactory to see that the establishment of the Shorthorn Society, an institution much needed, will be proceeded with. There is only further to notice in the business of the past week the lecture delivered through its new chairman by the Council to the subscribers to the Royal Agricultural Benevolent Institution. It would appear to be considered very improper to take any notice of any merely general complaints, whereas we should have thought it the duty of the direction to ascertain, for its own sake, how much or how little complaint was warranted.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

MONTHLY COUNCIL, *Wednesday, Nov. 4, 1874.*—

Present: Viscount Bridport, president, in the chair, the Duke of Bedford, Earl Cathcart, the Earl of Lichfield, Lord Chesham, Lord Kesteven, Lord Tredegar, the Hon. W. Egerton, M.P., Sir Massey Lopes, Bart., M.P., Sir A. K. Macdonald, Bart., Mr. Barnett, Mr. Booth, Mr. Bowly, Mr. Cantrell, Mr. Dent, Mr. Druce, Mr. Edmonds, Mr. Brandreth Gibbs, Mr. Hemsley, Mr. T. Horley, jun., Mr. Holland, Mr. Hornsby, Col. Kingscote, M.P., Mr. Bowen Jones, Col. Loyd Lindsay, M.P., Mr. McIntosh, Mr. Masfen, Mr. Milward, Mr. Ransome, Mr. Ridley, M.P., Mr. Rigden, Mr. Sanday, Mr. G. Turner, Mr. Jabez Turner, Mr. Wakefield, Mr. Welby, M.P., Mr. Wells, Mr. Jacob Wilson, Mr. Whitehead, and Dr. Voelcker.

The following new members were elected:
Adams, George, Tidwell Farm, Faringdon.
Barwell, Thomas, Spalding Common, Lincoln.

Best, Captain John Charles, Plas-y-n-Vivod, Llangollen.
Brown, George Fowler, Newton, Desford, Leicester.
Burra, William, Pomfret, Ashford, Kent.
Callan, Philip, Dowdstown, Ardee, Louth, Ireland.
Cummins, Edward Russell, Enfield, Middlesex.
Elkins, William, Elkington, Yelvertoft, Rugby.
Gartside, William, Smetheoft, Wroxeter, Shrewsbury.
Gibbons, George, Tunley Farm, Bath.
Griffith, Charles Marshall, Llwyndurio, Llandyssi, South Wales.
Horner, George Wood, Athelhampton Hall, Dorechester.
Hosegood, Obed, Dellington, Hinton.
Ingham, John, Marr, Doncaster.
James, James, Les Vauxbichets, Guernsey.
Keane, Richard F., Derrinheen, Cappoquin, Co., Waterford.
Kennard, Rev. R. B., Maranull, Blandford.
Langham, Herbert Hay, Cottesbrooke Park, Northampton.
Lyon, William, Arlington Manor, Newbury, Berks.
Morgan, Charles Elliot, Flatts House, Bishop Auckland.

Phillips, Thomas Henry, Brooklands Farm, Perry Barr, Staffs.

Reynolds, William Smith, Spalding Common, Lincoln.

Robinson, William Walker, Southfield House, Sedgelyield, Ferryhill.

Smith, Henry, jun., The Grove, Cropwell Butler, Bingham.

Starkie, Major L. N., Huntroyde, Burnley, Lancashire.

Stephenson, Robert, Brierton, Greatham, Durham.

Wheeler, Rowland, Steephill Farm, Ventnor, Isle of Wight.

Young, Captain E., The Terrace, Ryde, Isle of Wight.

FINANCES.—Colonel KINGSCOTE, M.P., presented the report, from which it appeared that the Secretary's receipts during the past three months had been duly examined by the committee, and by Messrs. Quilter, Ball, and Co., the society's accountants, and found correct. The balance in the hands of the bankers on Oct. 31, was £622 6s. 10d. The quarterly statement of subscriptions and arrears to Sept. 30, and the quarterly cash account, were laid on the table. The arrears then amounted to £1,372.

The Committee recommended that the Secretary be instructed to take the necessary steps to sell out of the funded property of the Society, the sum of £3,000, to meet the excess of expenditure over receipts at the Bedford meeting.

The Committee directed the attention of the Council to the constantly increasing expenditure in connection with the country meetings. At present the expenditure on show-yard plant exceeds £6,000 per annum; that on trials of implements exceeds £2,000; the stock prizes and expenses of judges, forage, and other matters connected with the exhibition of stock, costs £5,000 per annum; printing, advertising, and bill-posting exceeds £1,000; while sundry matters bring the total to over £15,000. The Committee, therefore, suggested that the attention of the stock prizes, the implement, and the show-yard contract committees be specially drawn to this subject.

The ordinary receipts of the society have of late exceeded the expenditure by about £1,000 per annum, but the recent increase in the grants for education, potato investigations, and farm prize competitions, have now deprived the society of this aid towards supplying the deficiency in the show-yard receipts; it is, therefore, more than ever necessary that the expenses of the country meetings should be reduced, if possible.

With reference to the suggestion proposed by this Committee in August last, that local agents should be appointed throughout the country, for the purpose of increasing the number of members of the society, the committee recommended that the secretary be instructed to communicate with each member of council requesting nominations of suitable persons in their several counties.

Mr. Milward regarded the final paragraph of this report as derogatory to the society, and moved that it be cancelled, and Mr. Masfeu seconded this proposition, which was supported by Mr. Jacob Wilson and Mr. Dent Dent, who hoped that the expenditure of the society on the country meetings would be reduced, but not that on experiments, education, or farm prizes. Lord Cathcart having asked a question as to the cost of the new dynamometer, which was replied to by Mr. Booth and Mr. Brandreth Gibbs, the paragraph in question was expunged, and the remainder of the report adopted.

GENERAL TAUNTON.—Lord Kesteven reported that Mr. J. S. Bult had been appointed steward of forage for the Taunton meeting, and had accepted the appointment. The Committee had consulted the members of the Taunton local committee, who were of opinion that Exmoor and Dartmoor sheep should be shorn before exhibition, and not shown in their wool as at Plymouth; the Committee recommended that this opinion be acted upon, and that copies of the proof of the stock prize sheet be sent

to the local committee when printed. They also recommended that Mr. G. Turner and Mr. J. Hemsley be added to the Committee. This report was adopted.

STOCK PRIZES.—Mr. Milward (chairman) reported that the Committee recommended several alterations in the Bedford prize sheet for adoption by the Council for the Taunton meeting, and that the proposed new prize sheet be printed and taken into consideration in December. This report was adopted after a conversation, in the course of which Mr. Dent suggested the omission of prizes for Suffolk horses and hunters over four years old; Mr. Wells, the omission of the Clydesdale classes, Lord Cathcart the fixing of a superior limit of six years at the age for hunters; and Mr. Masfeu, that the local committee might take up some of the classes.

Mr. Wakefield gave notice that at the December meeting he would move that no prizes be given for hunters over six years old.

REPORT OF JOURNAL COMMITTEE.—Mr. J. Dent (chairman) reported that the committee, in placing upon the table the autumn number of the *Journal*, regretted the delay in its publication, which had been caused by the heavy work falling upon the reporter of the implement trials. No less than 370 implements, in 33 classes, in addition to those entered for the special prizes given for guards for thrashing-machines, had been tried and reported upon. This had also caused a considerable increase in the cost of the *Journal*, both in printing and in illustrations.

The committee recommended payments amounting to £859 18s.

There are 17 entries for farms in the three classes for Somersetshire, as follows:

CLASS I.—HILL FARMS.

George Babbage, of Nettlecombe, Taunton.

Joseph King, of Norton Hautville, Bristol.

CLASS II.—DAIRY FARMS.

Cornelius Collins, of Orchard Leigh, Frome.

Robert A. Day, of Ubley Farm, Bristol.

George Gibbons, of Tunley Farm, Bath.

CLASS III.—OTHER FARMS.

Alfred Bowerman, of Capton Farm, Williton, Taunton.

William Bullen, of Crewkerne.

Wm. Thomas Culverwell, of Durleigh Farm, Bridgwater.

John G. Davis, of Blagrove Farm, Milverton, Taunton.

Thomas Hembrow, of Stoke St. Gregory, Taunton.

Obed Hosegood, of Dillington Farm, Ilminster.

John R. Keen, of Chewton Mendip, Wells.

Thos. M. Lang, of Barrington Court, Ilminster.

James Mead, of Curry Mallett, Taunton.

Messrs. Musgrave and Sons, of Pyrland, Taunton.

Edward Paget, of Burnett, Bristol.

Thos. P. Waltham, of Spaxton Court Farm, Bridgwater.

Mr. Little, of Laulhill, Chippenham; Mr. Thomas Outhwaite, of Goldboro', Knaresboro'; and Mr. Bowen Jones, of Ensdon, Shrewsbury, had accepted the office of judge; and Mr. Bowen Jones will write the report. The committee trust that the first inspection will take place during the present month. This report was adopted.

MEMBERS' SUGGESTION SPECIAL COMMITTEE.—Mr. M. W. Ridley, M.P. (chairman), reported that the committee had met and considered the various suggestions referred to them. Many of these being of some importance they recommended that the suggestions and the decisions hitherto arrived at be printed for circulation among the members of the committee, in order that they may be revised if necessary, and a report presented to the December Council. This report was adopted.

POTATO DISEASE.—Mr. C. WHITEHEAD, chairman, presented the following report: The judges appointed to inspect the growth of the six varieties of potatoes which

were entered for competition as disease-proof, and planted in trial plots in twenty different places in England, Scotland, and Ireland, have reported that none of the varieties have resisted the potato disease. During the period of vigorous growth, in all the varieties, in five out of the twenty localities the disease was virulent, and by the end of the season it was found that in almost all these places more or less disease was apparent; so that the question of disease-proof potatoes, as far as these trials are concerned, has been practically decided in the first year. The notebooks of the growers and the reports of the judges contain much valuable information as to the influence of soil, climate, and various methods of cultivation upon the action and progress of the potato disease. The committee, therefore, recommend that Mr. Carruthers, who has carefully inspected every trial plot, be requested to collate these experiences for publication in the next *Journal* of the Society. The potatoes which were grown upon the trial plots, after having been carefully examined by the judges, and the per-centages of diseased tubers ascertained, have been sent to the Agricultural Hall. It is proposed that the competitors shall have the first offer to purchase the produce of their own entries, and that if they, or any of them, decline, the potatoes shall be sold by auction or by salesmen, as the committee may determine. It will be remembered that the Council reserved a power to enforce a penalty of £20 in case of the failure of the entries of any competitor to resist the disease, but the committee recommend that this penalty be not enforced in any instance. Most important communications have been received from Professor De Bary, who has ascertained, by recent experiments, that the potato disease is not propagated by infected tubers; that although the mycelium of the fungus (*Peronospora infestans*) was distinctly apparent in the stalks of plants raised directly from diseased tubers, no gonidia or germs were evolved. The Professor remarks upon this curious circumstance that he is struck by this result of seeing the fungus with the naked eye during two or three months in his little field, and all the plants and leaves intact. Professor De Bary, in a later communication, expresses sanguine hopes that he has at last discovered the certain nid, or resting-places, of the oospores, or active primary germs of the fungus, which, as he says, would essentially accomplish its life history; and the great practical results of these discoveries, if perfected, will obviously be that measures may be taken by potato growers to avoid planting potatoes after, or in the immediate vicinity of plants known to be suitable to the development of the oospores of the fungus, or that steps may be taken to destroy them *in situ*.—This report was adopted.

HOUSE.—Colonel Kingscote, C.B., M.P., reported that the painting of the inside of the house had been done to the satisfaction of the committee, and that they recommended that the Secretary be instructed to procure two new hall lamps at a cost not exceeding £10. This report was adopted.

IMPLEMENT.—Mr. B. T. Brandreth Gibbs reported that the committee recommended that a meeting of the Implement Committee be held on the Tuesday of the Smithfield Club week, and that the judges who adjudicated on mowing machines at Manchester be invited to attend, to assist the committee in determining the scale of points and the method of trial. The committee recommended that the competing towns be requested to provide 50 acres of early-sown rye, for the trials of reaping machines in 1876; and that, upon the recommendation of the judges, there be a final trial of the selected machines at the time of wheat harvest. This report was adopted.

SELECTION.—Colonel Kingscote, C.B., M.P. (chairman), reported the following recommendations of the

committee: 1, that the Duke of Bedford be elected a vice-president, in the room of the Earl of Egnont, deceased; 2, that the following new members of Council be elected, in the place of Colonel Kingscote, elected a trustee; Messrs. J. Wells, of Booth Ferry, and Mr. James Webb, of Fladbury, deceased, viz., the Earl Spencer, K.G., of Althorp, Northampton; Mr. J. Martin, of Littleport, Ely; and Mr. H. Chandos Pole-Gell, of Hop-ton Hall, Wirksworth. This report having been received, it was moved by Colonel Kingscote, seconded by Mr. Milward, and carried unanimously, "That the Duke of Bedford be elected a vice-president of the Society." The election of Earl Spencer as a member of the Council was then moved by Colonel Kingscote, seconded by Lord Kesteven, and carried unanimously; that of Mr. Martin was moved by Colonel Kingscote, seconded by Mr. Dent Dent, and carried unanimously; and that of Mr. Pole-Gell was moved by Colonel Kingscote, seconded by Mr. Booth, and also carried unanimously.

EDUCATION.—The Duke of Bedford (chairman) reported that 29 candidates had entered to compete for the Society's elementary scholarships, viz., two from the Bedford Middle-class Public School, and 27 from the Surrey County School at Craleigh. Also that Mr. Charles Howard, of Biddenham, Bedford, and Mr. J. Bradshaw, of The Knowle, near Craleigh, had consented to act as local secretaries. Mr. Bowen Jones having brought the question before the committee whether endowed schools, otherwise eligible, should be entitled to send candidates to compete for these scholarships in future years, the committee were of opinion that an endowment is no disqualification. This report was adopted. The committee gave notice that at the December Council they would apply for a renewal of the Education Grant for 1875.

SHOWYARD CONTRACTS.—Mr. B. T. Brandreth Gibbs reported that the surveyor's report had been received, showing a balance due to Mr. Penny (after deducting the 5 per cent. discount stipulated in his contract) to be £331.

The gross cost of the showyard, grand stand,	
and other works, amounted to	£6,055 14 7
Being an excess over Hull, 1873, of	£249 3 8
And over Cardiff, 1872, of	397 8 7

The surveyor reports that the levelling and preparation of the showyard at Taunton has been placed by the Taunton committee in the hands of Mr. Penny. The preliminary plan for the Taunton showyard was laid before the committee, and it was resolved that the same be reduced so as not to exceed the preliminary plan of the Cardiff meeting, and be subject to such alterations as may be found necessary hereafter. The surveyor handed in the agreement between the secretary and the contractor for the repairs to be done (as already ordered) to the permanent buildings, and the committee recommended that the secretary be authorised to sign the same. This report was adopted. The president reported the resignation of Viscount Hill, a vice-president of the Society.

The Earl of LICHFIELD then brought forward the resolution, of which notice on his behalf had been given by Mr. Holland, as follows: "That a committee be appointed to take into consideration the Society's charter, and to suggest what alterations, if any, are advisable to be made therein, for the purpose of bringing members of Council into more frequent communication with members of the Society, and also for permitting the discussion in Council of measures of a practical agricultural nature, although pending or to be brought forward in either of the Houses of Parliament." He wished at once to disclaim any suggestion that he or any other member of Council who had moved in this matter felt any dissatisfaction with the present management of the Society. His chief object was to

popularise the Society with its own members and with the public, as there was a general impression abroad that the members have no voice in the management of the Society's affairs. He also wished to remove the prohibition upon the Council to discuss matters pending or to be brought forward before either House of Parliament, as he considered that this prohibition impaired the usefulness and efficiency of the Society. With regard to his first object, he looked upon the prevalent opinion of the members as well-founded, and he referred to the ordinary course of proceedings at the general meetings, and the stringent rule in the Charter (section 9), as showing that the sole management of the Society was vested in the Council, without any control on the part of the members, as is usual in other societies. The function of the members was limited to the making of suggestions at the invitation of the chairman, and to their comments in their individual capacity. It was no doubt true that members could express their sense of mismanagement by the Council, by declining to re-elect any of the trustees or vice-presidents, and any of the twenty-five members of Council who annually retire by rotation, and are eligible for re-election; but the Charter fixes the day for the transaction of such business so inconveniently, that the members have not a fair and full opportunity of bringing their opinions before the Council, even on that occasion. He considered that these questions alone furnished ample grounds for asking for a committee to consider the question of an alteration of the Charter. On the question of the prohibition of certain subjects from their discussions, he averred that nobody felt more strongly than himself the importance of excluding party politics from them; but he held that to be a very different matter from the childish law that the Council were not to discuss a given subject simply and solely because it already was before Parliament, or was about to be brought before either House of the Legislature. The progressive legislation of the present day often rendered it very desirable that the Government should obtain the opinion of the Council on practical questions; but their charter prevented them from discussing such questions as cattle diseases, except during the Parliamentary recess. It had also, some time ago, prevented their giving the Government any information as to the value of malt as food for stock; and although good roads were as useful to the farmer as good machinery, the Council could not take up any aspect of such a question. He confessed, however, that this matter alone would not have induced him to ask for a committee to consider a revision of the charter, and he thought that if it were granted they would require a very stringent bye-law to prevent the introduction of a question of party politics upon any pretence or in any guise whatever. He had heard with regret that it was found desirable to curtail their expenditure, for he held rather that the Society should increase its income. The number of subscribers was small in comparison with the extensive privileges which members enjoyed for a small subscription, greater, he believed, than that offered by any other society in the world; and therefore he could not help thinking that the small number of members pointed to a defect in the constitution of the Society. He believed that defect chiefly to be that members had not that share in the management of the Society that subscribers to all institutions naturally looked for. He, therefore, moved for the appointment of a committee in the terms of his notice.

Mr. HOLLAND seconded the motion. He had brought forward the notice in Lord Lichfield's name, as his lordship was out of England at the time, and had on a previous occasion brought forward a similar resolution. He believed that by a judicious alteration of the Charter they would gain subscribers, without altering the character of

the institution. He thought that they should alter the date of the general meeting when the members of Council were to be elected, and that the members of the Society should have an opportunity of knowing beforehand what was proposed to be done. The Charter was now more than a quarter of a century old, and since it was granted times and feelings had changed. He, therefore, thought that the Charter should be amended to suit the circumstances of the present day, but that at the same time they should be careful not to admit party politics into their discussions.

Earl CATHCART, in supporting the motion, expressed the pleasure that he had felt in discharging the duties of president during his term of office on every occasion when his services were required in that honourable position, with the single exception of the general meetings of members. These meetings he held to be un-English, because the Charter did not allow the members to be outspoken, and at Bedford particularly not only his successor (Mr. Holland) but also every member of the Council who was present at the general meeting must have felt that they occupied a false position, and that the meeting itself was a sham. He then urged the great importance of popularising the Society, the framework of which was now too narrow. He would himself suggest one important general meeting of the Society in December, to which the election of members of the Council should be submitted. He held that the more fresh air and ventilation they obtained the better; but they should always consider that the great object of the Society was to promote the production of the greatest quantity of food on a given space, and that the prosperity of the Society was only to be obtained by its promotion of English agriculture.

The PRESIDENT remarked that this was a question of the greatest possible importance to the Society, and was deserving of great attention. He thoroughly agreed that members of the Society should have more voice in the election of members of the Council; but, in discussing the list of members, it should be borne in mind that since the formation of this Society many other agricultural societies had arisen, which offered locally somewhat similar advantages to its members. He feared that farmers too often looked only to the circumstances of their own locality, and not to English agriculture generally. With regard to the question of discussing matters before Parliament, or having a political tendency, he thought they should exercise great caution.

The Earl of LICHFIELD expressed his great satisfaction that no opposition had been offered to the principle of his motion, as on the previous occasion when he had brought forward the question he had been met with the argument that the Charter had worked very well, and that it was better to let well alone.

Mr. CANTRELL quite agreed with the object of the motion, and stated that it was generally considered the Council was too exclusive in electing its members.

Mr. DENT DENT observed that at present the Council had no option as to the mode in which its members were elected, but he thought it most desirable that they should be enabled to consult the members of the Society on such matters. With reference to the other question, he reminded the Council that the motto of the Society was, "Practice with Science," and he hoped that they would always confine themselves within its meaning.

Mr. W. EGERTON would be sorry to see such questions as road-legislation brought before the Council, and he thought it most undesirable that they should trespass into the province of Chambers of Agriculture.

The motion having been put to the Council was carried unanimously, and the appointment of the committee was postponed until the next Monthly Council.

The Secretary was instructed to send letters relative to the Country meeting of 1876 to the authorities of Birmingham, Peterborough, Nottingham, Lincoln, and Derby.

The Secretary was authorised to sign and seal with the common seal of the Society, a power of attorney to enable the London and Westminster Bank to receive the dividends on the Society's funded property.

An application from the Boiler Insurance and Steam Power Company (Limited), for the loan of the Society's Dynamometer, was granted on the usual terms and conditions.

A communication was received from the statistical and commercial department of the Board of Trade, enclosing

a copy of the programme of an international agricultural exhibition to be held in Algiers.

The following special Committee for revising the list of judges was appointed on the motion of Mr. Milward:—Colonel Kingscote, Mr. Barthropp, Mr. Booth, Mr. Bowly, Mr. Cantrell, Mr. Dent, Mr. Druce, Mr. Hemsley, Mr. Horley, Mr. Leeds, Mr. Masfen, Mr. Milward, Mr. Randell, Mr. Rigden, Mr. Sanday, Mr. George Turner, Mr. Wells, Mr. Jacob Wilson, with the Hon. Director, and the Stewards of stock and implements.

The general meeting of members was fixed for Thursday, December 10, at 12 o'clock. The Council then adjourned to Wednesday, December 9.

THE FARMERS' CLUB.

OUR VILLAGES: THEIR SANITARY REFORM.

The first meeting of the Farmers' Club for the Winter Session took place on Monday evening, November 2, at the Salisbury Hotel, Mr. E. M. Major Lucas in the chair. The subject fixed for discussion, as given above, stood in the name of Mr. James Howard, of Clapham Park, Bedford.

The CHAIRMAN, in opening the proceedings, said he was extremely pleased to see so good an attendance after what was termed the recess, and he hoped the gentlemen before him had all as good crops that year as they might expect. In April and May they discussed the interests of farmers and the subject of land-laws and landlords; that evening they were going to overhaul the villages and talk about sanitary reform. The subject before them would be introduced by a gentleman who had already read many excellent papers, and who did not require any introduction from him to ensure attention to his contributions to the discussions of that Club. Without any further remarks, he would call upon Mr. James Howard to open the subject.

Mr. HOWARD then read the following paper:—

INTRODUCTION.—REVIVAL OF SANITARY SCIENCE.—As far back as 1848, and on many subsequent occasions down to quite a recent date, the London Farmers' Club has discussed the great subject of the sewage of our towns and cities; but, singularly enough, it has never once turned its attention to the more home question of village sewage, and the sanitary condition of our rural population therein involved. Two or three months after the subjects for discussion in 1874 had been selected by the committee of the Club, the great contest in the rural districts between capital and labour occurred. This naturally attracted a large share of public attention to the general condition of our rural population. Could I have foreseen that "special commissioners" would have been despatched to the disturbed districts, and graphic accounts of village-life morning after morning would have been given to the country by the daily papers, I should probably have shrunk from handling a subject which was shortly to engage the attention of so many able men. There are, however, phases of the question, and questions of a practical character, the discussion of which by the members of this club may tend to throw light on some of the problems yet unsolved.

In a celebrated speech of the present Prime Minister of England the remarkable statement occurred that "the first consideration of a minister should be the health of the people." Mr. Disraeli, like ministers in another sphere, did not, however, lead his hearers to suppose that the work was to be left exclusively to the ministers; for he observed, "I think public attention ought to be concentrated on sanitary legislation. I cannot impress upon you too strongly my conviction of the importance of the legislature and society uniting together in favour of these important results." The prime minister evidently recognises the force of the well-known aphorism of Franklin, "Public health is public wealth." My object in bringing the subject before the Club is to enforce the same maxim, and to induce its members and the agricultural public to unite in supporting the legislature in carrying into practice a wise, a thorough, and a beneficent system of sanitary legislation.

The stage of civilisation at which a country has arrived may

be gauged by the attention paid to cleanliness, and a natural observance by its members of the laws which govern health. The Greeks, the Romans, the Egyptians—to say nothing of the Jews—have left behind them faithful records, both in their literature and in the ruins of their cities, of the care they bestowed upon cleanliness and its kindred subjects. After a long reign of ignorance, extending over many centuries, the present generation has witnessed a gradual awakening to the importance of sanitary matters; already great strides have been made in sanitary science, and, as Dr. Arthur Ransome has remarked, when the time comes for writing the history of the reign of Queen Victoria, among the long list of beneficent enactments, it will be found that all the legislation of any real importance for securing the public health has been the work of the brilliant Victorian era.

It would be easy to quote sensational paragraphs from the official reports of commissioners as well as from other sources, but I shall refrain from attempting at any length to prove that our villages stand greatly in need of sanitary reform, for, notwithstanding Lady Stradbroke's pleasing picture, we must all admit the fact that a state of things exists in many, nay, I may say in most of our villages, which, as members of a civilised community, we deplore and would gladly see remedied. To retort that there is as great or greater need of reform in towns and cities, does not help the case, for, as a well-known Birmingham radical, in a recent article in *The Fortnightly*, says, "the dwellers in towns ought to be the first to admit the charge, and its justice should make them chary of condemning landlords and farmers in the country as more hard-hearted or illiberal than others. Both town and country are alike powerless to deal with the evil by individual effort or merely personal exertion, and they should strive to concert measures together for discovering and applying a remedy."

I have said that I should not take up time in attempting to prove, at any length, the necessity for reform, still, I cannot pass over the question without remark. I happen to reside in one of the best cared-for counties in England. The Dukes of Bedford have, during the past 30 years, erected many hundreds of convenient and handsome labourers' cottages; they have also carried out a variety of sanitary improvements upon their estate; their efforts to raise the labourer's condition have stimulated other proprietors, many of whom, I am glad to say, have followed their example, and yet what do we find to be the state of things in many of the villages of this highly-favoured county? If time permitted, I could, from the reports of the Medical Officers to the Rural Sanitary Authority, give a catalogue of facts and scenes as appalling and revolting as any to be found in Mr. Culley's or Dr. Fraser's (the present Bishop of Manchester) reports to the late Government. Whole villages almost devoid of water, and dependent upon ponds and holes made by the roadside; families herded together in wretched houses unfit for human dwellings, without drainage or privy accommodation, and with foul middens at their very doors. Writing of overcrowding (against which evil, as I shall hereafter show, the law has not provided a remedy), the medical officer of the northern division of the county of Bedford, states "it is a common thing to find a married couple with five or six, and even seven or eight sons and daughters of all ages

sleeping in one, or at most, two small rooms, without any chimney or efficient means of ventilation. I have often, in the course of my professional work, been called into these rooms at night when the greater part of the family have been in bed and when the state of the room has been sickening." Having alluded to such conditions militating against health, morality, and common decency, he concludes, "no more fertile source of the scrofulous diseases which are the scourge of our population can be conceived." Until the passing of the Public Health Act, 1872, the various Sanitary Act, so far as rural districts were concerned, were all but a dead letter, and useless. The Act of 1872, which, I may remark, was passed with the general concurrence of the public, although deficient in many particulars (a point I propose to take up at a later stage) was most important in this particular—it rendered the action of local authorities compulsory, so that most of the evils which exist can no longer be shirked, but must be dealt with in some way or other. Without dwelling farther upon the present condition of our villages, or wasting time in discussing theories, I propose at once to proceed to the more practical question, What can be done to remedy the existing evils? and in the first place I will take up the question of that essential requirement of every community—water.

WATER SUPPLY.—I place water first, because, next to the food of the people, it is the most important requirement for every community; and an abundant supply of pure water is not only of primary importance in a sanitary point of view, but one of the greatest blessings of life. On the other hand, it is now generally recognised that no more fertile source of disease and human decay exists than bad and contaminated water. One authority asserts that to its use he has traced the origin of a variety of diseases; among them he states "diarrhoea, dyspepsia, dysentery, malarious and typhoid fevers are the most prominent."

"At present the majority of villages suffer either from scarcity or impurity of water, or from both. Too long has the country been deluded by the fallacy that good water and plenty of it is the special quality of country districts." So wrote Mr. Bailey Denton, in the *Royal Agricultural Journal*, in 1870, and that the remarks were truthful has since been but too abundantly proved by the reports of medical officers in all parts of the kingdom. The incumbent of a parish near to my own writes me: "In this parish, of over 3,000 acres, there are no springs, and wells are out of the question, owing to the great depth of the stratum of clay. During this last dry summer poor people had to go miles for their painful water, and farmers had to send carts to the river for their supply"—a distance of several miles. There are no natural causes for such a state of things. Providence supplies us with an abundance of water, and the fault rests with the community. This, one of the most precious gifts of Nature, is grievously wasted and neglected. We have our wet seasons and our dry seasons; we cannot yet store up the heat of our summers, but there are no insuperable difficulties in storing the rains of winter.

The average rainfall of England and Wales is at the rate of 32 inches per annum. Every inch per annum is equal to about 23,000 gallons—in weight no less than 100 tons—per acre. In our drier counties, with a rainfall of 20 inches, to say nothing of dew fall, upwards of 2,000 tons of water fall annually upon every acre.

It is calculated that for the twenty-five millions of population in England and Wales, the supply of water, by rain alone, is twenty-seven million millions of gallons, or one hundred and eighteen thousand four hundred millions of tons; that the quantity consumed by man and beast as well as by engines and other contrivances, is three hundred and sixty-five thousand millions of gallons—in other words, we only use about one-seventy-fourth part of our total rainfall.

From wells, streams, rivers, reservoirs, and tanks our wants are supplied. It appears to be the general opinion of sanitary authorities, that where good water can be obtained at a depth not exceeding thirty feet, a well is the best provision. Having sunk many wells myself, as well as some reservoirs, my experience leads me to concur in this opinion. The only remark I would make about wells is, the great danger of contamination, if cesspools, privies, middens, sewers, or foul ponds are allowed near them. Many cases of filtration to wells from these sources, both in towns and villages, have come under my observation, so that, long ago, having narrowly escaped from dangers of the kind, I resolved that the first thing to be done

in going into a new house is to have the well examined and the water tested. At a farmhouse in a village near Bedford, the occupier, some years ago, put up a water-closet, and ran the excreta into a large pond or moat some 100 or 120 feet from his well. No thought of danger was apprehended until an outbreak of illness occurred, when it was discovered that the well had been contaminated with human excrement.

As to wells, however, there are very wide tracts of country where they are quite out of the question, and where storage is the only available method; having long since been convinced by the reasoning of my friend, Mr. Bailey Denton, that it was a wise policy to husband the water which falls in winter for use in summer, ten years ago I dug a reservoir at Clapham Park for this purpose; it is situated in the line of a master drain which conveys the drainage water of about 150 acres. This reservoir contains about 400,000 gallons, and cost £50 excavating; a vast quantity of water passes through it in winter, and, ever since it was made, we have had an abundant supply through the driest summers. So satisfied was I with the experiment, that last year I made a second one, of about double the size, at the other side of the farm. I am convinced that on the retentive clay soils of the kingdom, where wells cannot be provided, an abundant supply of water might thus be stored in reservoirs, connected either with main drains or streams. Where the natural formation of the ground is favourable for embanking at one end, as was the case with the second reservoir I made, they could be constructed at a comparatively small expense. The water in my reservoirs is good enough throughout the year for most domestic uses; but, for drinking purposes, it should be boiled or filtered, especially in the summer months. A collateral advantage from the general adoption of reservoirs would be that our winter floods in the valleys would be sensibly diminished.

The vicar of a high-lying parish near to my own writes me as follows: "When I first came here (some 20 years ago), I had a well dug 40 feet deep, and bored another 40 feet, without any change in the hard clay; giving the work up in despair, I had a drain dug to a large pond about 20 yards off and well filled with washed gravel, and the water thus drained to the well has formed our supply ever since. It is cold and clear, and I believe, although I have not had it tested, quite pure. I attribute the pureness of the water to the length of the drain through which it has to percolate." I give this example, believing that many similarly situated will find this, or a less costly reservoir, the readiest plan of supplying their wants. I would advise them, however, to have the filter cleaned periodically.

Reservoirs are more easily constructed, and at less expense than is generally supposed. Mr. Denton is of opinion that, by combination, an average sized village could, in many cases, be supplied with a reservoir, iron service pipes, and stand pipes for taps at a first cost of 25s. per head; or, if the reservoir were constructed and paid for with money borrowed at 5 per cent., and the repayment spread over 40 years, sufficient water for each village could be obtained at a maximum cost of 1s. 3d. per year per head. Dismissing the question of reservoirs, which must depend more or less upon local circumstances, I will pass on to the mode of storing water in tanks.

Tanks for rain-water falling upon the roofs of houses are another means, now frequently resorted to, for storage. In a letter to *The Times*, about twelve months ago, Sir Philip Rose called attention to a plan adopted upon the chalk formation in the Chiltern Hundreds; he stated that a tank, 10 feet deep and six feet over, sufficient for two ordinary sized labourers' families, if the drains from the cottage roofs are properly connected, can be made in that district at an outside cost of £2 per cottage; the ground is simply excavated to the required dimensions, and the sides and bottom plastered with three coats of Portland cement, mixed with sand and gravel. There would, of course, be greater difficulty and expense in other formations where puddle or brickwork, or perhaps both, would have to be resorted to in order to make the reservoir durable and water-tight. The expense will, of course, vary with the character of the subsoil, but in no case can it be very formidable. A tank, 16 feet long by 10 feet wide, will, for every foot of depth, hold 1,000 gallons, and it is estimated that from the roof of an ordinary cottage, covering only 2½ poles, as much as 7,000 gallons per annum may be collected when the rainfall is only 20 inches; and so, from a farmhouse with outbuildings, covering 10 poles, 28,000 gallons a-year may be collected. I

need scarcely say that it is highly desirable that care should be taken in constructing such tanks to prevent the influx of impure water from surface drainage, and that, wherever practicable, the roof water should be passed through a filter bed of some kind.

The other day I went over to see the sanitary improvements carried out by Sir Anthony Rothschild in his cottages at Aston Clinton and adjoining villages. I found that in each cottage, water, brought from the Chiltern Hills, had been laid on. It is not everyone who can, in this particular, follow the example of Sir Anthony, or who, if willing, has a public water-works so near at hand. I have mentioned it, because on inquiry of the cottagers I found that it was a boon highly prized. One man remarked that he did not know what they should now do without it. The wife joined in, and said, "Yes, sir, it is a great convenience, and it saves us so much in soap." Indeed, who can estimate the value to these poor people of an abundant and constant supply of the purest water for drinking, cooking, and washing, or—what is also important—its value for carrying away a good deal of filth, which, without it, would be sure to collect in and about the dwellings? If time permitted, I could enumerate other means of providing water. In Egypt, where the water is only 12 to 20 feet below the surface, I have seen a mule or a donkey working a centrifugal pump, and often one of the primitive "sakias"—a kind of chain and bucket lift—raise water enough for the supply of a large village. To those, however, who would pursue this subject of water supply further, I would refer them to Mr. Bailey Denton's excellent paper, "Village Sanitary Economy," published in the *Royal Agricultural Journal* of 1870.

LABOURERS' DWELLINGS.—Passing to the subject of cottages, I would remark that the labourer's home has for many years past afforded abundant material for discussion. The circumstances alluded to at the opening of my paper have, during the present year, had the effect of concentrating public attention to an unusual extent upon the important and vital question of improved dwellings for our peasantry. The providing of a sufficient number of new cottages for our agricultural population, and the reconstruction of deficient ones already existing, form a question of momentous interest, and the financial aspect presented is one of the gravest importance. Some idea of its magnitude may be gathered from the remarks which fell from Lord Napier and Ettrick at the Social Science Congress, two years ago. His lordship remarked, "If a minimum of one-third of the agricultural homes of Great Britain require to be rebuilt, you have something like a measure of our great necessity on the rural side of the question. It is a matter of building 700,000 cottages, at a cost of 70 millions sterling." In the absence of complete census returns, Lord Ettrick made, perhaps, an estimate not far from the mark; but, looking to the wide extent of the subject, the knowledge already possessed, and the limits of my paper, I will not dwell upon this portion of the subject, but pass on to the question of drainage, sewerage, and the disposal of sewage. Before doing so, however, I would remark that a few years ago I built a block of six cottages, for my own farm labourers, entirely of concrete. This material is decidedly better than brickwork, is warm and dry—indeed, impervious. The walls are a foot thick, each cottage has three bedrooms, and each is provided with an earth closet at the end, but accessible from within. The cost of the whole, exclusive of the earth closets, was only a little over £600.

DRAINAGE, SEWERAGE, AND SEWAGE.—I would point out that drainage and sewerage, formerly interchangeable terms, have come to mean two things. Drainage is now understood to be the means of draining off and conveying water from the soil and surface; sewerage the means of removing refuse in a liquid or partially liquid state.

In an assembly of practical agriculturists, I need not enlarge upon the sanitary advantages of under-draining. The improvements which have taken place in our rural districts by draining away the subsoil and surface water are so manifest as to be universally recognised if not universally adopted. In my own county ague and fever, 30 and 40 years ago, were very common in certain villages; since draining has been carried out the former has altogether disappeared, and the latter has greatly decreased.

To prevent capillary attraction, and to ensure dry cottages, it is highly desirable—in some cases indispensable—to put in a drain completely around the buildings at a lower level than

the foundations. Before building my own house, situated on boulder clay, I not only did this, but carried a drain right through the centre. As a proof of the good resulting from such drainage, even to the lower animals, I may say that some years ago being at the country stables of a well-known London horse-dealer, he complained to me of the trouble he had experienced in keeping his horses in health and free from colds. The soil is London clay. I advised him to adopt the same means I subsequently put in practice at my own house. On meeting him a few months ago he assured me that he had derived the greatest benefit from having followed my advice; indeed, that he had had very little trouble since.

I need not however dwell further upon drainage, a question well understood by agriculturists, but pass on to the more knotty points of sewerage, and how the sewage is to be disposed of. A great variety of schemes have been before the public for dealing with sewage, but in treating of village sewerage, I do not deem it necessary to occupy time in discussing them, for practically there are only two systems open for adoption in rural districts, namely, earth or box closets, and water sewerage.

In scattered villages a general system of sewerage, like that adopted in our towns and cities, is in most cases out of the question, not only on account of the expense, but because waterworks are an essential portion of the plan. There is moreover an additional objection: sewage irrigation, a necessary part of the system, whilst most successful and economical on a large scale, is troublesome and expensive on a small one. Whilst strongly in favour of sewage irrigation, for what I may term "populous places," I have come to the conclusion that for most villages the earth or box system will have to be depended upon. As previously stated, I paid a visit lately to the estate of Sir Anthony Rothschild in Buckinghamshire. The worthy baronet has carried out the earth system in the most thorough manner, and, I may observe, as only an autocrat can do. Would that all autocrats were as enlightened and liberal as Sir Anthony Rothschild. Earth-closets have been supplied for 175 cottages and three schools. Two men and a horse-and-cart are employed the whole year round in attending to them; one man in collecting the earth and carrying it to and from the cottages and the drying-kiln, the other in preparing and drying the material. The kiln floor is over a retort at a private gas-works, and therefore the fuel costs nothing; and as to smell, so complete is the deodorisation that nothing offensive can be detected. About 200 tons of earth are required annually, which is dried twice over, and yields about 120 tons of excellent manure. The farm-manager informed me that it is a good fertiliser for any crop, and the lowest estimate to be placed upon its value is £3 per ton—perhaps £4 is nearer the mark; Sir Anthony, therefore, has not made a very bad investment. My experience of earth-closets has convinced me that it will not do to leave them to the cottagers without some oversight. I could if necessary give many proofs.

I have already spoken of the water-supply to the Aston Clinton cottages. The slops from the sinks, &c., are carried by a sewer to a small water-tight tank or cesspool in each cottager's garden. The sewers being trapped outside the cottage walls, no effluvia escapes. The occupiers empty the cesspools about once in a week or ten days, and use it upon their gardens. Mr. Rogers Field, C.E., of 5, Cannon-row, Westminster, has adopted at his cottages, situated at Shenfield, near Brentwood, a very simple and ingenious tank. Attached to the tank is a self-acting syphon, which, when the tank becomes full—not till then, draws off the liquid and discharges it into sub-irrigation drains laid one foot deep, with common two-inch agricultural pipes. The solid matter left at the bottom of the tanks is occasionally cleared out by the cottagers and used for manuring their gardens. This sub-irrigation has been carried on for six years past. The liquid is said to be readily absorbed by the soil and vegetation, and the plan to yield good results. Whether plants should be thus nourished or irrigated from below is open to question, but it is not a very material point so long as the refuse is got rid of without trouble or creating a nuisance. The price of the tank, £5, is a much more serious objection; but one, however, Mr. Field hopes to remove by getting the tanks made at half-price in earthenware instead of iron. In dismissing the subject of tanks or cesspools, I may observe that whenever adopted, in order to compel frequent

emptying, they cannot well be too small, and, with a view to prevent leakage, too carefully constructed.

With respect to water-sewerage, I would for a moment call attention to the following typical case from a recent report of the medical officer to the Bedford Rural Sanitary Authority. In reporting his visit to a large village on the banks of a river, after urging the necessity of establishing some general principle in dealing with the disposal of excreta, Dr. Prior, the officer, states, "I find large drains or sewers in course of construction, the level of the lower portion of which will be two feet below that of the mill-head, and which will ultimately empty themselves into the mill-tail. This mill-tail and the mill-head in the next village are not very far from synonymous, and it is not to be supposed that the inhabitants of the latter place can look with complacency on any scheme for the discharge of sewage into the stream whence some derive their water for household purposes, and some their drinking-water. Moreover by the 11 and 12 Vic., c. 63 and 80, and the 29 and 30 Vic., c. 90 and 111, the pollution of any stream under the control of the sanitary authority is constituted an offence punishable by fine. We are thus immediately brought face to face with one of the preliminary difficulties which beset the application of a system of sewerage to villages; but there are many others so numerous and so formidable that they can only be met completely by a system of water-works and sewage irrigation, if they can be by that. It is therefore with grave reluctance that I should witness the attempted extension of such a system to districts purely rural."

I have described this as a typical case, for unquestionably where sewers are made in villages they, as a rule, empty their contents into the nearest stream. Looking to the certainty that the time is at hand when the public will no longer tolerate the practice of pouring filth into our beautiful streams and water-courses, it will be well that in the case of new sewers they should be laid with a view to the sewage being ultimately utilised by irrigation. Unless this is kept in view, many mistakes are likely to be made in the levels of the outfall sewers.

The Local Government Board has recently—as I think unwisely—sanctioned the opinion that "House Slops" do not come under the head of sewage, and can therefore be discharged into rivers and running streams. Notwithstanding this decision there is no doubt that the public will insist upon house slops—mostly urine and other filthy stuff—being included in the prohibition I have referred to. From conversations with Mr. Bruce (Lord Aberdare), I know that, but for the length of time taken by the River Pollution Commissioners in completing their report, the late Government were prepared to deal with this subject three years ago. Now that we have a Government whose policy is endorsed as a "sewage policy," there ought not to be a doubt that it will be effectually and quickly dealt with.

My friend, Mr. W. Hope, the well-known sanitary engineer and sewage farmer, to whom I wrote for information upon a point or two, has been good enough to furnish me with a copy of a report he had made to a rural sanitary authority in the North. I wish that time permitted to read it, for it is full of valuable information. Reporting upon three adjacent but scattered villages, Mr. Hope says, that to sewer them thoroughly and to connect every house and privy would be so costly that the people would abscond rather than pay the rates, and therefore recommends the pail or box system, a plan very much adopted in my own district. Mr. Hope recommends galvanised iron pails, with a handle at each end, and says if they are made to hold about 20 gallons each, they will last an average family of five persons for a week, and if emptied into a previously dug trench and covered over, the result will be that the garden will be manured, and the excretal matter will never be heard of again. The inspector to the Rural Sanitary Authority, Bedford, informs me that box-closets answer well, and, as a rule, are made to suit the old privies. He finds about 2 feet 6 inches long, 1 foot 6 inches deep, and 1 foot 6 inches wide are a convenient size. The closet lid should be made to lift up on hinges, and either the riser made moveable, or a door and frame made large enough to draw out the box at the end of the privy. Galvanised iron is the best material: with wood and zinc the soil percolates the zinc, and decays the wood: either ashes or earth answers very well. Unless the lid is made to lift on hinges a great nuisance is caused by throwing in the ashes, as some of these always remain on the seat if thrown down the hole carelessly.

On the question of house slops Mr. Hope states that he found that the total quantity escaping did not amount to more than 0.12 of an inch of rain; a small garden therefore is sufficient to deal with the slops, and recommends the system of sub-irrigation and subsoil drainage.

Reporting upon another village more densely populated, Mr. Hope recommends it being sewered, provided that fair terms can be made to connect the sewers with those of an adjoining town in possession of a sewage farm: a desirable plan for villages thus situated, and one, I may observe, which has been carried out between the borough of Bedford and the great County School, built in an adjoining village. Mr. Hope justly observes: "Nothing is so unsatisfactory or so expensive and troublesome as sewage irrigation on a very small scale. If the flow of the sewage does not run to 50,000 gallons a day there is not enough to give continuous occupation to one man, and the result always is that it is neglected; so it neither answers from a sanitary nor from a pecuniary point of view."

When circumstances are favourable in a village for water sewerage, perhaps the plan carried into practice at Eastwick Park Farm, near Leatherhead, will be found worthy of attention. In the *Sanitary Record* of Saturday last, Mr. Hutchison, steward of the Eastwick Park Estate, calls attention to the effective and economical means of disposing of the liquid refuse of the village of Eastwick, and the liquid manure of the farm, by the use of a self-acting sewage regulator, the joint-invention of Mr. Bailey Denton and Mr. Rogers Field. This contrivance is said effectually to overcome the difficulty of dealing with a small flow of sewage without constant attendance, but as I have not seen it in operation I can express no opinion.

SANITARY LAWS—DIFFICULTIES AND DEFECTS.—I now come to the difficulties of carrying the sanitary laws into effect, and the shortcomings of these laws. On this branch of my subject I have taken counsel with Mr. Sharnan, solicitor, of Bedford, a gentleman of great experience as clerk to the Rural Sanitary Authority, and for years clerk to the Board of Guardians, and who has kindly given me the benefit of his knowledge and experience. One of the chief and most perplexing difficulties arises from the number of Acts of Parliament, partly in existence and partly repealed, also from the mixture in the Acts of urban and rural provisions in such a way as to render it a matter of considerable doubt, to all ordinary persons, what the law really is, and causing much trouble, even to experts. The only remedy is the consolidation of the Acts, or a new general Act, repealing all existing Acts, so framed that the provisions relating to urban and rural authorities, to gas, water, &c., shall be separated. The defects in the rural sanitary laws are chiefly manifest in the provisions which deal with (1) water supply; (2) sewerage; (3) overcrowding; (4) infectious diseases.

(1.) With respect to water, the law gives power to the sanitary authority to cause to be provided a necessary supply of water to a house without a proper supply, providing it can be furnished to it at a rate not exceeding 2d. per week. This rate of 2d. is found to be totally inadequate; practically there is no power to compel an owner to provide a good supply of wholesome water, and though under the Act of last session power is given to magistrates to close a well or cistern, people may still be compelled and are at liberty to draw their supplies from even more objectionable sources. Whilst feeling the necessity of not pushing sanitary regulations too far, I do think that this time of day a house which has not a decent water supply ought to be condemned as unfit for human habitation.

(2.) In the matter of sewers and sewage, when new cottages are built, the sanitary authority can compel owners to make suitable provision, but the law gives no power to compel an owner of any existing cottage to provide it with a privy or closet, and if he has one, and pulls it down, there is no power to make him build another.

In a vast number of villages a drain, originally made to carry off the surface-water from the road, runs down the main street; into this drain the inhabitants have assumed the right to pour their filth. The question often arises to whom does this drain belong? The highway board or parish surveyors repudiate it, and say it is a sewer; the sanitary authority repudiates it as a mere surface-drain. Should not powers be conferred upon sanitary authorities to cut off the communi-

cations, and thus compel the inhabitants to make suitable provision for their sewage?

The powers given for the prevention of pollution of streams are apparently ample, but the remedies are by no means simple. It is next to impossible to persuade county magistrates to cut off these drains, converted into sewers, especially in the absence of any other provision for the sewage. Indictments and Chancery injunctions are not nice proceedings against neighbours, and therefore the abominations, with their evil consequences, continue, because the law is puzzling, and the county magistrates timid or squeamish. Perhaps the county court judge of the district might be armed with power to grant an injunction, and to deal with such cases.

(3.) As to overcrowding, this is a question of no little difficulty; still, as matters stand, there is no law to prevent a dozen grown-up people, if of one family, living and sleeping in one room. The Acts of the 29 and 30 Vic., c. 90, and the Nuisances Removal (1865) appear to clash; perhaps the simplest method would be to fix a minimum space to each individual, and in accordance, give powers to sanitary inspectors to prohibit overcrowding.

(4.) As to infectious diseases, owing to the circumlocution now necessary where disinfectants are required, disease is often spread half over a village before steps can be legally taken to arrest it. Power should be invested in the sanitary authority, upon an *ex parte* order of a magistrate, at once to disinfect any such premises in case of default upon the part of the occupier. Powers should also, I venture to think, be given to sanitary authorities to erect or hire houses to be used as hospitals, without having to wait for the sanction of the Local Government Board. As a further precaution against the spread of infectious diseases, some amendment of the Act of 29 and 30 Vic., cap. 90, is required, with a view to prohibit children from an infected house going to schools or other public places.

In the Society of Arts report, just published, the following appears: "The past session has shown that the President of the Local Government Board was at last becoming aware of the reasonableness of the views, so persistently urged upon him by the committee, that somebody of higher authority, and presiding over an area of greater extent than that of a Town Council or Board of Guardians, was required to control a direct local action, and that a supervision and correction of boundaries of districts was an essential to the initiation and completion of sanitary measures."

At a conference of medical officers of health, held at King's College, London, in January last, at which the defects, requirements, and difficulties appertaining to the present sanitary laws were fully debated, an important string of resolutions was unanimously adopted. Without setting aside the present machinery, the necessity was affirmed by the first resolution, that if combined sanitary districts were to be maintained, each should possess a central committee consisting of members appointed by the several sanitary authorities entering into the combination; and further, that each of the latter should manage its sanitary duties through the medium of a special committee of its own body, instead of attempting to do it by the agency of the whole board of guardians at large.

It was argued in favour of combined districts, that it would economise the time both of officers of health and other persons concerned; that much labour would be saved in keeping books, making returns; attending meetings; that it would tend to uniformity of action, for it would not have to contend with the conflicting opinions of the proper interpretation of the law by the clerks of adjacent districts; and also put an end to much waste of labour and inefficient administrations to which the want of a completely organised constitution now gives rise.

Another point rigorously insisted upon was, that the district medical officers should not be appointed health officers, as even men of good professional standing felt the duties to be a serious embarrassment; and in the case of a needy practitioner, holding perhaps a local appointment, how could he be expected to fulfil the duties of the office in the face of the magnates of the neighbourhood?

"S. G. O." in one of his vigorous letters to *The Times* upon this subject, asked "Where is the town or village which has not its influential magnate or magnates?" and argued powerfully against local control. Grand schemes for sanitary government are being propounded; and the country is to be mapped out for the purpose into districts corresponding with its natural watersheds, and other great changes advocated; but if the pre-

sent rural sanitary authorities will only carry out the Acts with willingness and a fair amount of determination, such is the fear entertained by the public of being over-governed by sanitary officials, that they may be let alone for many years to come; if, however, an opposite course should be pursued by them, the signs of the times point to a speedy transfer of their powers to other bodies.

CONCLUDING OBSERVATIONS.—In bringing my observations to a close, I would call attention to the fact that where well-considered sanitary measures have been adopted in towns and cities the advantages to the inhabitants have been so marked that the circumstances should act as a powerful stimulus to exertion in carrying the same benefits to our villages. In the borough of Bedford, where a comprehensive scheme of sewerage and water supply was carried out a few years ago, the general health of the inhabitants has greatly improved, and the death rate has fallen to the very low average of 16.08 per thousand, or about 29 per cent. below the former mortality; indeed the town of Bedford is now healthier than the surrounding country districts. Again, at Salisbury, it was stated at the recent meeting of the British Association that in consequence of the sanitary improvements carried out in that city the death-rate has fallen from 27 in a thousand to 16 in a thousand.

As farmers we have the deepest interest in rearing a race of men "strong to labour;" unquestionably the strength, moral and physical, of our peasantry depend to a large extent upon the sanitary conditions with which they are surrounded. There is nothing more certain than that the race cannot improve, but will degenerate, unless the conditions are favourable. The subject I shall conclude with is one I would willingly pass over, but the labour question is one in which the landlord, the tenant, and the labourer, as well as the public, have the profoundest interest, for upon the labour supply the value of land in all countries mainly depends. I am not an alarmist, still I do not think it wise that we should shut our eyes to the fact that our colonies and other countries are coming forward in a way they have never done at any former period—in something like an organised form—to bid for our labour, and the competition and the organisation both appear to be growing. Danger at present does not appear to be imminent, and it is, perhaps, an idle boast of the emigrant agents that they will drain our rural districts of their best blood; still it is the object at which they aim, and the movement, disguised though it is by violent language, may just as well be looked fairly in the face. To argue this subject would however be beyond the scope of my paper, and might lead to differences of opinion. I therefore content myself by simply alluding to the facts by way of preface to the remark that the natural affection of an Englishman for his home and country is proverbial, but when that home is a wretched hovel, what is there to bind and localise the labourer's sympathy or attachment? How can we, under such circumstances, expect him to withstand the wiles of emigration agents and other interested leaders? Put the same man into possession of a sweet and comfortable cottage, a well manured garden, with its vegetables and flowers, an orchard with a prospective crop of fruit to pay the rent, home under such circumstances is a reality not to be hastily bartered away for the frozen fields of Canada, the plains at the Antipodes, or the more tempting prairies of the Far West.

Mr. HOPE (Romford) had listened with deep interest to the paper just read, and there were only one or two points in it with which he did not agree. Mr. Howard thought that the Sanitary Act of 1872 made the action of the sanitary authorities compulsory, and that interference on their part could no longer be shirked. He could wish that were the case, but unfortunately he had had a good deal of experience to the contrary. It was, perhaps, within the knowledge of many gentlemen present that for the last five years he had been endeavouring to utilise the sewage of Romford, in Essex. Instead of making a handsome profit of it, as he expected, he had sustained a heavy loss. For some time he could not understand why that was the case, as everything was conducted *secundum artem*, and he had the assistance of the Committee of the British Association in recording his experiments. At last it was discovered that the population of Romford, instead of being, as he was told, 8,000, was only 6,500, and of that number only 4,500 were included in the area which supplied the sewage. The Local Board of Romford had advertised the sewage, and they entered into a lease "demising" the sewage to himself. In the first year he

obtained such results as he expected, the quantity of land being only 60 acres; but the case became different when his operations were extended, the reason being obvious. The Local Board being a public body, he appealed to them with confidence for justice, but they would have nothing to say to him, and the result was that he had first to go into a court of law, and was now in the Court of Chancery; and when he was likely to get out of the latter court he did not know (laughter). As regarded the question of compulsion, the first Act said that if a complaint were made to the Secretary of State that a local authority was not doing its duty, he might enforce compliance with the object of the Act, the word being "may," not "shall," and a subsequent Act transferred the permissive power from the Home Secretary to the Local Government Board. He did not know whether Mr. Howard meant to apply the word "circumlocution" to the latter, but it seemed to him to apply to all Government departments, and he ventured to say that the existing powers were insufficient. With regard to the question of providing reservoirs for water, he feared that the word reservoir was almost synonymous with pond, and that if open reservoirs were used—unless the water were boiled and filtered before being used, which was not likely to be done very carefully in labourers' cottages—serious consequences to health would ensue. The nidus of typhoid fever was supposed to be vegetable substances, such as leaves, and with open reservoirs there was great danger of fever being spread from that source. But covered reservoirs sufficient for the purpose need not be exceedingly expensive. Some time ago he provided one to contain 800,000 gallons at a cost of £2,500. As regarded the construction of new cottages, it had been proposed by Lord Napier that the entire cost of construction need not be repaid in 25 years, and he did not see what was the necessity for repaying within that period; or why a certain proportion of the costs—say two-thirds or one-half—should not remain as a permanent burden on the estate. For the disposal of slops by subsoil drainage, the system alluded to by Mr. Howard was at once simple and efficient. But it was necessary that the subsoil pipes should be socket-pipes or else have collars. They should be placed like an inverted herring-bone, and as near the surface as possible, so that it might easily be cleared, in which case, if no great manifold value were obtained, there would at all events be no nuisance. In the case of fecal matter, he had used such galvanised tanks or pails as Mr. Howard had described, and found them to answer completely.

Dr. VOELCKER (London) wished to make one remark in reference to what had been said about tanks. He was an advocate for the use of open tanks in villages, provided that the bed were properly formed. He believed, in fact, an open tank to be preferable in the country to a covered one. He was a great believer in the potential agency of atmospheric oxygen, which, coming in contact with shallow water, would fully oxidise everything of an organic character which it might contain. He must remind Mr. Howard that the reservoirs of the largest companies were open, and the advantage of that was that there was a readier access for the oxygen than when closed reservoirs were used. [A MEMBER: "That prevents evaporation." Yes; but under that system they also saved great expense. Again, he thought they should be very careful how they introduced the sewage system into rural districts. As to the water-closet system, he believed that in villages and small towns they could easily get rid of human excreta without having recourse to that expensive system, which had, he might observe, polluted their rivers and their small water-courses to a fearful extent. Only that morning he had read an account of an alarming outbreak of typhus fever in the Over-Darwen district, in Lancashire. He was not surprised at that state of things, recollecting what he had seen there two years ago. At that time he had spoken very strongly against the use which was being made, by the mill-owners and other inhabitants of the locality, of the border of a small river for the sewage. He could not help saying that he thought it quite possible to get rid of human excreta without polluting water in that way, or running the risk of injuring persons who lived at a distance.

Mr. FOWLER (Aylesbury) having visited the village of Aston Clinton, referred to by Mr. Howard in his admirable paper, could bear testimony to the excellent results of the earth-closet system, under the management of Sir Anthony Rothschild; and he could also state that he had

seen the system in operation elsewhere, and anything more foul than the operation of that system without proper supervision it would be impossible to conceive. He had found the receptacle for dry earth converted into a place for keeping faggots and storing wood; and on opening a lid underneath he found a liquid cesspool. They all knew how careless poor cottagers were apt to be in reference to everything relating to sanitary matters, and they might feel quite certain that, generally speaking, if there were a pail of slops to be disposed of, it would be likely to go into the earth-closet, supposing that to be the nearest to hand. Sir Anthony Rothschild's system was admirably carried out; but the earth-closets were all kept under lock and key, and neither Mr. Howard nor himself could get a sight of them. The man who had the key lived two miles off, and on going there they found the earth being prepared for carting to the village, where it would afterwards be carted back again. As a contrast to the admirable manner in which Sir Anthony managed matters, he might observe that, while staying at the house of a member of Parliament, he went to an earth-closet in an adjacent garden, and found it covered over with cobwebs, none of the earth having been removed for two or three months. As regarded the question of the sanitary condition of the people, and how it might be ameliorated, he might appeal to his friend Mr. Treadwell, who was the chairman of a local board in his district, whether the great object there was not to save money? He did not think much was being done practically for the sanitary improvement of labourers' cottages. He knew, indeed, that it was a most difficult thing to do any good in that respect; the first point was, in his opinion, to educate people into love or care for sanitary improvement (Hear, hear). If there were a broken window, the poor would stuff the hole with a rag, and they could not bear to leave a window open. There was, in fact, the greatest difficulty, as a rule, in getting them to attend to matters that concerned their own health. A labourer of his having had his hand injured driving steam cultivation, and lock-jaw having supervened and resulted in death, he afterwards found the deceased's family living in such a wretched dwelling that the dead body had to be left in the room where the family lived, and the whole family slept in one room; yet the father and two sons were earning among them 45s. a week, and younger children from 8s. to 10s. besides. As to sewage irrigation, he felt that the question was a very difficult one, but he was fully convinced that, where practicable, it was the only solution of the question. He had been to see the works at Luton, and anything more foul or filthy he had never witnessed. The effluent was, he believed, about equal to the standard laid down by the committee on that subject, and it was as black as ink. This was carried out under the precipitation or lime principle.

Mr. TREADWELL (Upper Winchendon) having been pointedly alluded to by Mr. Fowler, as the chairman of a local sanitary board, could not help rising to repudiate the character which had been given to that board. He totally denied that their first aim was to save money: their first aim was to get the people into clean habits as quickly as possible, and they found that a very difficult job (laughter). They found themselves thwarted at every step. Some parties were very much averse to being interfered with at all, while in many instances the Act of Parliament did not allow them to go far enough. As regarded the erection of new cottages, he thought there should be power on the part of the authorities to compel owners to supply them with water and consume their own nuisances (laughter). It was too bad, that when men had built cottages for their own interest and benefit, they should call upon the occupiers of the soil to supply their tenants with water, and to convey the filth away from their property. Supposing that were done, the pecuniary result as regarded those owners would be that they would exact more rent, because the cottages would be worth more money (Hear, hear). So far as his advice could be of any use, he would insist that the owners of cottages should be made to do all that was necessary for sanitary purposes, instead of the cost being thrown on the general rates of the parish. He did not agree with Mr. Howard, that the local boards had no compulsory powers in respect to privies. He thought they had, at all events, power to say whether or not there should be one privy or two privies for two cottages. He was one of those who did not like to move too fast in those matters [A voice, "A Conservative,"

followed by laughter]. Yes, if they pleased. He would rather not see people driven in such matters, if it could be avoided. He would, however, insist on having at least one privy for two cottages, and, perhaps, as the people advanced, they would be enabled to go beyond that. As to the earth-closet, those of Sir Anthony Rothschild's cottages, they were, no doubt, perfect, but that was not the case with all closets of that kind. He should be very glad if owners of property generally would imitate Sir Anthony. As regarded water, there was in his district a good supply running from the Chiltern Hills; but all owners would not avail themselves of it, what they desired being that the Sanitary Board should do the work for them, whereas, in his opinion, they ought to be compelled to do it themselves. He believed that the local Sanitary Boards had power to prevent over-crowding in cottages, even if all the inhabitants belonged to one family, in cases in which the overcrowding was such as was injurious to health. The water supply was a very serious question. In many villages it was impossible to get an adequate supply of water in such a summer as the last. In a village in his district, on the recommendation of the Local Government Board, the practice was adopted of sending a man round the village every day to sell water; but after the third or fourth day the practice ceased, because no one would buy any water. He supposed that when people could not get water without paying for it, they did not require so much (laughter).

Mr. H. TRETHERY (Silsoc) felt that they were greatly indebted to Mr. Howard for the admirable way in which he had introduced that question. Practically, it was the most absorbing question of the day, and no member of the Club was more competent to do justice to it than Mr. Howard. Their friend had told them what he had done on his own estate, but he had not told them that he was the main mover in the changes at Bedford, which had been attended with so much benefit. All of them, who had had ought to do with that question practically, must have felt how difficult it was to carry out the various Acts of Parliament. Mr. Sharman, the clerk of the Bedford Board, who was alluded to by Mr. Howard, had remarked that there were so many Acts that it was really difficult to know how far any of them applied to a particular case, an evil which had been felt very much on his own Board. Boards had to administer the law, but it was truly and properly observed by the last speaker that they should endeavour to lead the people and not drive them. It was very uncertain how far the powers of Sanitary Boards extended. Allusion had been made to privies. It had been said that there could be no difficulty in securing the requisite privy accommodation. Mr. Treadwell contended that there should in all cases be at least one privy for two cottages, but unfortunately cottages were sometimes so arranged that it was scarcely possible to have a separate privy. Of course, it might be replied, that that was the business of the owner; that if he chose to build a cottage in such a situation he must take the consequences. As a rule, he thought there would not be much trouble in that respect. With regard to overcrowding, he differed from almost every one who had spoken on that subject that evening. Mr. Treadwell said he thought there was power to prevent it; in his opinion, there was not power. He knew an instance in which the magistrates had recently dismissed a complaint. It was a clear case of overcrowding, but the magistrates could not see that it was a clear case for them to adjudicate upon.

Mr. TREADWELL inquired where that occurred?

Mr. H. TRETHERY replied that it was at Woburn.

Mr. TREADWELL said he believed the magistrates had now adjudicated upon it.

Mr. TRETHERY proceeded: As regarded the application of the sewage system to villages, he thought there would be great difficulties in carrying it out successfully, and he believed that there were simple remedies, for the evil to be dealt with which might be effectually applied. Having had some experience in reference to earth closets, he did not believe they could ever get people to attend to them on a large scale, or that they could be carried out generally as they were under Sir Anthony Rothschild. On the whole, he could see nothing better than the old-fashioned privies, provided the cesspool were not placed too low and were well cemented; and the smaller it was made in reason, the better. They ought to bear in mind that the new Act had come upon them very suddenly. In dealing with that question, men were too apt to speak as if all the cottages belonged to the owners of landed property, and that it was

their duty to do all that was necessary; whereas, in fact the majority of the cottages, especially in small parishes, belonged to small proprietors, a great many of whom had not the means of doing what was requisite. Again, they ought not to be hasty in carrying out the provision of these Acts, and condemning all cottages which did not come up to the standard set up by the medical officer of the district. If all such cottages were to be pulled down, where were the poor inhabitants to go? Surely a bad home was better than no home at all (Hear, hear). They should endeavour to remove evils gradually, and not go too fast; and he had no doubt that it was in that way that they would do the most good in the end. If the Act was strictly carried out, the result might be that a large proportion of the cottages of this country would be declared to be uninhabitable; their doom would be sealed, they would be pronounced unfit to live in; and although he did not mean to say that no step should be taken in that direction as respected a great many cottages, yet he did think that those who had to administer the law should deal with the evil gently and gradually.

Mr. T. HORLEY (Warwickshire) agreed with the last speaker that the Act having come upon them suddenly, they should rather endeavour to educate the people up to it than carry out its provisions hastily; and he believed that if it were carried out according to its strict letter, the result would be the condemnation, not only of a large portion of the cottages of the labourers, but also of a large portion of the homesteads of the farmers (Hear, hear). He had taken considerable interest in that matter ever since the question first came under his notice. In his Union they were fortunate in having a very sensible man as their medical officer, and they had endeavoured to educate people up to the new law rather than put it in force before they knew what it meant. He was not an advocate for providing earth-closets, unless they could be placed under some responsible management like that alluded to in the case of Sir Anthony Rothschild. He believed that the old-fashioned midden system would, in most cases, be found better than the earth-closet system, but if that system were pursued the smaller the pan the better. An earth-closet, of the size of which Mr. Howard spoke, would require a man to attend to it; and unless it were attended to regularly, it might become a great nuisance. He thought the introduction of sewage irrigation into villages would prove a great nuisance. The contamination of wells was an evil which it was always difficult to avoid, and the danger would be increased by the adoption of that system.

Mr. A. PELL, M.P. (Leicestershire), lived in a Union where it was decided from the first that the new Act should come into operation through the action of a committee, and not of the whole Board, and he believed that, unless the sanitary authorities generally proceeded in that way, it would be found very difficult to give effect to the Act. The chief disputed point in Mr. Howard's paper appeared to be the closet system versus the water conveyance of fecal matter. However desirable it might be to adopt the earth system in cottages, it would be impossible to dispense with the other system. Mr. Howard had mentioned a clever way of disposing of fluid matter by sub-draining—Mr. Field's system of sub-irrigation; but any plan which was adopted by an authority should be one generally applicable, and the system in question was clearly not applicable where there was no garden, or where the garden rose above the level of the site of the cottage. That objection seemed to him unanswerable, and he ventured to say that, whether the earth-closet system was adopted or not, there must be some apparatus or means adopted for carrying away the sewage water, and it must be carried away rapidly and effectually, in order that it might not soak into wells, and contaminate the drinking water. The district in which he lived was most favourable for the spread of fever. The soil was of a loose description, resting on an impervious clay: you seldom had to dig down more than five or six feet before you got to water, and that being the case, it was not very difficult to understand that the inhabitants of cottages might, without great care, be easily poisoned through what came from the surface, there being perhaps, in many cases, a pig kept very near the well, and slops being constantly thrown down in the same direction. In that Union they had been favoured with a visit from a gentleman from Whitehall, who was in favour of the adoption of the earth-closet system. In point of fact, they knew very well what was required, but the question was, how far they were justified

in taxing the public for such an experiment. Wherever fever had been found to exist—and, alas! it was a frequent visitor to the Union—the locality was immediately mapped out, and a public sewer was constructed on the system suggested by Col. Rowlinson, the engineer of the Local Government Board. In some parishes the cost of such a work was a thousand pounds, in others only five or six hundred. They had been able to borrow money of the Government for such purposes at a very low rate of interest, and they had found the sanitary rate to be less than the fever rate. To that he might add, that the one fell upon the right persons, and the other upon the wrong ones (Hear, hear). In the case of a charge for meeting a fever rate, with proper sanitary appliances, three-fourths of the burden fell on the owners of the house property, and one-fourth on the land in the immediate locality; whereas, if sanitary measures were neglected, and fever and pauperism resulted, the cost thus occasioned did not fall on the immediate locality, but was spread over the entire Union. One word with regard to Medical Officers of Health. The employment of such men was in many cases a very serious matter. He would go so far as to say that, in many instances, that great and expensive gentleman was not merely not necessary, but that he was a positive mischief. It was perfectly well known that fevers arose from imperfect drainage and bad water. They did not want a doctor with £500 a year to tell them that, or to weaken responsibility: what they did want was good practical men to carry out the improvements which were necessary—men who had some knowledge and experience with regard to building, drainage, and other matters of that kind. It was useless to have a number of medical officers writing the same reports of the same kind for their several districts. The sources of small-pox and fever were the same in all districts, and money which was spent merely in repeating theories was thrown away. What they wanted were good engineers, and he hoped that one effect of the Act would be to provide them with such men. The ultimate disposal of sewage was a question on which he had avoided expressing any opinion. He wished he had a field just outside any village, in a convenient situation to receive it; but he should be very shy of constructing expensive filtration works, or apparatus for the disposal of liquid sewage.

Mr. H. NEILD (Manchester) said, those who occupied as he did, the position of chairmen of Sanitary Boards could not but feel that it was necessary to proceed with caution in respect to drainage. The question was, where drainage was to end? and what was to be done with the sewage? The public were contemplating the adoption of a drainage system of enormous extent, and, in the present position of agriculturists, that question was a very serious one. In his own district they had had a gentleman from Whitehall to give them advice, but he left them more confused than he found them (laughter). That gentleman gave them a great deal of instruction as to what they were to do, but he did not tell them what was ultimately to be done with sewage. They had never found any difficulty in compelling owners of house-property to comply with the requisitions made upon them as regarded privies and water supply. That question was a new one: it was now beginning to be appreciated; and if he mistook not, in the coming Session of Parliament it would be a question of questions.

Mr. ROGERS FIELD thought sufficient attention had not been paid to the importance of draining the sides of houses. He had tried the experiment of such draining at a cost of only two or three pounds, and the result was very satisfactory. [A member: "How deep do you go?"] That depended on the nature of the soil. In that case the soil was a clay one, and he went down 4 feet, and put gravel instead of clay. He fully agreed with previous speakers, that earth-closets, would not answer in cottages, except where more attention was bestowed on them than was likely to be generally found among the labouring population. Having adopted earth-closets he found that they were only attended to properly while he looked after them; and he believed that, as a general rule, a well-managed privy system would be found preferable. In connection with the question of sewage, they must take into account what were called house slops. The usual course had been to drain these into a ditch, but any one who had really studied the question must see that that was often attended with great evils. He concurred in the opinion expressed that evening that occupiers of cottages should, as far as possible,

be made to consume their own nuisances; but the great question was, how that was to be done? He differed from those who thought that if a system could not be carried out universally it should not be carried out at all, holding as he did, that the appliances should be adapted to varying circumstances. He was in favour of sub-irrigation wherever it was applicable, and believed that if pipes were laid down properly, that system would involve the least expense. He had himself laid down a continuous bed of 3-inch pipes, so arranged that they could easily be taken up, and the plan answered well.

Mr. TRETHERY would ask the last speaker what he would do in cases in which the garden was in a low situation?

Mr. R. FIELD said, in the instances to which he had alluded that was not the case; he had not maintained that the system was suitable for adoption in all cases.

Mr. T. DUCKHAM (Herefordshire) wished to say a word or two about those receptacles for filth—the horsepods, which in many cases received the refuse water of the adjacent houses and the manure from the fold yards. Some years ago two such ponds in his own neighbourhood continually led to cases of fever. When they came into his hands he cleaned one of them, and filled the other up, and afterwards there never was another case of fever. There was another pond which one could hardly go near without being reminded of its existence by bad smells but though frequent complaints were made the magistrates refused to interfere. He thought the sanitary authorities ought to direct their attention to those fruitful sources of disease, and the landlords to the use which might be made of the pure water which fell from the heavens in supplying stock with more wholesome water by spouting the farm buildings, instead of allowing the fertilising properties of the manure to be washed into the ponds.

Major DASHWOOD (Oxfordshire) strongly supported the views of the speakers who had found the earth-closet and box systems to be not applicable to labourers' cottages in the country, though both plans are useful under certain circumstances. Such closets were costly to the owners of property, required much supervision, and both plans were not adapted to the habits of the people. He would speak only as to cottages with gardens attached. With such cottages there is little difficulty as to the disposal of the excreta or slops, and from the results of much experience he as a rule would advise, for the sake of all parties interested, an adaptation of, and an improvement on, the old-fashioned privy; the strong point of which improvement was this, that the vault was above and not below the ground level. This important point was arrived at by having a step of six inches rise at the entrance of the building, then a second step of eight inches, making a total rise of fourteen inches. This fourteen inches rise, together with the front of the seat (which is composed of bricks on edge), formed the vault, the bottom of which was raised three inches above the ground level. The whole of the inside of the vault was coated with cement, and a six-inch concrete floor extended, say, four feet at the back. The vault was emptied without the least trouble through an archway opening made in the back wall. When the vault was empty this opening ought to be stopped up with sods or earth, and all the dry refuse of the cottage should be thrown and heaped up against it, so as to exclude the air as much as possible. This plan of privy had been much approved of by Dr. Child, the chief officer of health for Oxfordshire. From his (Major Dashwood's) experience he could not advise for such cottages any drains from sinks, or underground drains for slops; and he was now pulling up and doing away with such drains, which he had put to cottages about fifteen years back. These drains, although well trapped, brought vitiated air into the cottages, and from getting stopped up had injured the water in the wells. He would suggest the following hints for cottagers as to the disposal of slops and other refuse, and the management of privies. All slops should be thrown into a shallow hole made in the garden (not near to the cottage or well), and as the hole becomes full or offensive it should be filled up and another made. Slops should never be thrown into the privy vault, and the opening through which it is cleaned should be well closed, so as not to admit air, which hastens decomposition; and vegetable and other dry refuse should be thrown against this opening to assist in excluding the air. The more frequently ashes and dry earth were thrown down through the seat into the vault, the freer from unpleasant smell would be the place.

The CHAIRMAN, in winding up the discussion, said he

agreed with other speakers that the Club was deeply indebted to Mr. Howard for his excellent paper; and he congratulated those present, on the manner in which that subject had been ventilated. No one could doubt that it was necessary to look after the health of the community, and some of the magnates of the land having been stricken down with fever, it was probable that the question would now occupy more attention than ever. The discussion of that evening should show the labourers of England that the Farmers' Club was not unmindful of their interests, and, not wishing them to freeze among the snows of Canada, was desirous of securing for them habitations which would promote their health and comfort at home.

Mr. J. HOWARD then replied. After remarking that he was much gratified at the practical turn which the discussion had taken, he said that members who had differed from him must not suppose that he was unaware of the difficulties and the responsible nature of sanitary improvements. Experience had taught him the very contrary. Replying to some points raised by Mr. Hope he (Mr. Howard) did not wish it to be understood that he considered the Sanitary Act of 1872 perfect. But he directed attention to the fact that it was the first instance of sanitary legislation which made it compulsory upon boards of guardians, and other local authorities, to put the existing Acts into motion. He believed that great good had attended their operation thus far, and that they were calculated to confer still greater benefits upon the community (Hear, hear). With regard to the storage of water, the great question at issue appeared to be one of expense. He himself thought that the wants of the rural community might be very well supplied by means of the less-expensive system of open reservoirs, supposing that the water obtained from such sources were afterwards boiled and filtrated for drinking purposes. Further it was a moot point with sanitary engineers whether open or covered reservoirs were best. Trees should not be planted around open ones as the vegetable matter falling into them would pollute the water. With regard to the very conflicting opinions which had been expressed respecting the powers of the sanitary authorities in reference to over-crowding, he still adhered to the opinion which he had himself expressed, and in support quoted from the 29th and 30th Victoria. It must not be supposed, as some of the speakers seemed to imagine, that he was in favour of pushing sanitary measures to extremes; on the contrary, he had advocated moderation, and should be sorry to see the stringent powers of the Acts pushed too far at once. He agreed in very much of what fell from Mr. Trethewey, but he did not concur in his preference for the old-fashioned privy system; and he believed that gentleman would find very few sanitary inspectors or engineers who would concur in it. He also dissented from the opinion of Mr. Pell on sub-irrigation, that any system which was not universally applicable must be useless; indeed, it was obvious that many good plans were only of service upon limited areas. Nor could he agree with the remark of Mr. Pell, that medical officers of health were useless. He thought special attention and study would be directed by these officers to the work so as to meet its requirements, and that in time we should have throughout the country a very valuable body of specially trained medical officers. Mr. Brown, of Tring, before he had left had given him the following short account of his earth-closets: "My earth-closet forms one end of a shed, in the corner of which I keep a supply of sifted dry earth taken from the garden. A box is fixed from the closet-seat to the ceiling, sufficient to hold a fortnight's supply; this is filled from an aperture opening to the shed. The earth is let down upon the deposit by means of an iron lever with a handle, which is connected with a roller, and allows a limited quantity of earth to fall down precisely in the same manner as a farm drill acts. A brick cesspit is constructed behind the closet, which receives the deposit, and is only emptied once in twelve months. The closet is perfectly sweet, and the earth is renewed without any offensive smell; it is put upon the meadow, and shows to a foot where it was used."

Mr. C. S. READ, M.P., in moving a vote of thanks to Mr. Howard for his excellent practical paper, alluding to some calls which had been made for himself, disclaimed any want of courtesy in not responding to them; the reason being that on account of the official position which he occupied, he thought "discretion the better part of valour."

The motion was seconded by Mr. MERRI, and carried unanimously.

The meeting terminated with a vote of thanks to the Chairman.

At a meeting of the Committee, on Monday, November 2, Dr. Voelcker was elected Chairman of the Farmers' Club for 1875.

THE SMITHFIELD CLUB.

A Council meeting was held at the Agricultural Hall on Wednesday, November 4th. Present—Colonel Loyd-Lindsay, V.C. M.P., President of the Club, in the chair; the Marquis of Exeter and the Duke of Bedford, Vice-presidents; Messrs. H. Aylmer, C. Barnett, J. N. Beasley, E. Bowly, J. Druce, T. Duckham, W. Farthing, Brandreth Gibbs (Hon. Sec.), J. Greetham, W. Heath, T. Horley, C. Howard, J. Howard, J. W. James, W. Ladds, R. Leeds, C. S. Read, M.P.; W. Ridgen, H. Webb, and J. Wilson.

Authority was given to the hon. secretary to take any steps that may be necessary in reference to holding the Show this year in conformity with the Orders of the Privy Council.

The committee was re-appointed to make the usual arrangements for disinfecting the cattle conveyances belonging to the persons sanctioned by the Club for conveying live stock to and from the Show.

The Council prepared, in conformity with the bye-laws, the house list of 16 members, from which the Council recommended the members to select 8 names to replace the 8 who retire by rotation and are not eligible for re-election for one year.

The Council, in conformity with the vote of the last general meeting, appointed three scrutineers to examine the voting papers previous to the next general meeting.

The following gentlemen were elected stewards of live stock: Mr. Henry Fookes, of Whitechurch, Blandford, to succeed his brother, the late Mr. Wm. Fookes; and Mr. T. C. Booth, of Warlaby, Northallerton.

The death of Mr. Samuel Druce, a trustee of the Club, having been announced, the Council resolved that the hon. secretary write a letter of condolence to Mrs. Druce, and that Mr. Joseph Druce be elected a trustee in his place.

Questions of qualification of live stock entries for the Show were decided.

Arrangements were made for the use of pails for live stock during the Show, so as to prevent those used at other shows being brought into the building.

The following gentlemen were elected members of the Club: J. Brown, J. Turvill, W. Parham, A. F. Puckridge, E. P. Heady, J. S. Storr, T. Lucas, W. Stanford, A. M. Longman, E. W. Usher, W. Yates, R. Attenborough, W. R. Killick, H. Smith, jun., Colonel Luttrell, D. McIntosh, W. Ball.

The thanks of the meeting were voted to the President for his conduct in the chair.

THE ROYAL AGRICULTURAL BENEVOLENT INSTITUTION.

At the meeting of the Council on Tuesday, November 2, Mr. C. S. Cantrell in the chair,

Mr. J. DRUCE proposed that the December meeting of the Council should henceforth be always held on the Tuesday in the Smithfield show week, and not on the first Tuesday in the month.

Mr. J. K. FOWLER called attention to certain complaints which had reached him from subscribers.

The SECRETARY stated that due replies had been given to any communications received from the local secretary at Boston.

Mr. T. C. SCOTT protested against the consideration of the Council being given to mere reports. If there were no tangible facts to be brought forward in connection with such cases as the Lincolnshire one mentioned, he was opposed to entering on any discussion of such matters.

Mr. T. C. Scott, of Moorgate-street, was nominated Chairman of the Council for 1875.

Mr. J. J. MECH gave notice that he should move at the next meeting of the Council that "an increase of £100 per annum be made to the salary of the Secretary."

THE SHORTHORN HERD-BOOK AND SOCIETY.

The Committee appointed at a general meeting of breeders of Shorthorns, held at Willis' Room on the 1st July last, met on Wednesday, November 3rd, at 34, Charles-street, Berkeley-square, the house of Col. Kingscote, who took the chair: It was, after much consideration, resolved that the negotiation for purchase of *Coates' Herd Book* from Mr. Stafford not having been brought to a successful termination, the Committee would, as soon as practicable, issue a report of their proceedings from the date of their appointment, and invite Shorthorn breeders generally to join in the formation of a Society in accordance with the second resolution passed at the general meeting. [The resolution here referred to ran thus: "That it is desirable to form a Society to consist of Shorthorn breeders and managers, with a limited managing committee, for the purpose of collecting and publishing accurate information as to past and current pedigrees and sales, and promoting the general interest of Shorthorn breeders."]

HIGHLAND AND AGRICULTURAL SOCIETY OF SCOTLAND.

At the first monthly meeting of the directors for the season held on Wednesday, in their chambers, 3, George IV. Bridge, Edinburgh, the following resolutions were passed:

1. That the directors of the Highland and Agricultural Society desire unanimously to express the deep and sincere regret with which they have received the information of the death of their late chemist, Dr. Thomas Anderson.

2. That the Society having in the minutes of the general meeting held on the 17th of June last recorded, upon Dr. Anderson's resignation of the office of chemist, their sense of the great importance of the services which he had rendered to the science of chemistry by his original researches, and to the Society's chemical department by the fidelity and accuracy of the work executed on its behalf, it only remains for the directors to deplore the loss which they and the Society have now suffered.

3. That the directors request the Secretary to transmit a copy of these resolutions to Mrs. Anderson, with their respectful condolence and sympathy, upon the occasion of the painful bereavement which Mrs. Anderson and her family have sustained.

At the general meeting of the Society, held on 17th June last, it was, on the motion of Colonel Innes, of Learney, agreed to memorialise Government on the subject of agricultural education. The following is the memorial agreed to: To the Right Hon. the Lords of the Committee of Council on Education, the Memorial of the Highland and Agricultural Society of Scotland, incorporated by royal charters:

Showeth,—That your memorialists beg respectfully to bring under your consideration the desirableness of affording to the working-classes of the country instruction in the sciences specially bearing on agriculture.

That at present there are no schools for these classes in Scotland where such instruction can be obtained, though the importance of affording the means of such instruction can scarcely be exaggerated.

That agriculture is a great national industry, through which the country is supplied with the chief articles of food, and above three millions of the population of Great Britain obtain employment.

That agriculture, to be successfully prosecuted, depends now on knowledge and training very different from what were formerly sufficient.

That in times past crops were raised and stock reared by the operation of very simple and primitive processes. In the present age the implements required by farmers depend on ingenious and complicated mechanical contrivances. Not only for the construction but for the management and working of these implements a knowledge of mechanics is required. The fertility of the soil needs to be stimulated by artificial compounds, which must be prepared with special reference to the nature both of soils and crops. The stock bred and fed on

farms must obtain particular treatment, so as to ensure production of good meat in a short time and at small expense. All these processes depend more or less on a knowledge of mechanics, chemistry, and physiology. The most important recent improvements in agriculture have been made by persons versed in these sciences.

That it is therefore necessary, both for a successful prosecution of the art and for its future development, that those of our population who wish to adopt agriculture as a profession should have an opportunity of obtaining instruction in the sciences bearing on agriculture.

That it is understood to be the object of the Department of Science and Art to afford to the working classes intending to follow any important industry means of instruction in the sciences bearing on it. Thus persons intending to be engineers, manufacturers, builders, miners, or mariners, are, in the schools or classes encouraged by the aid of the Science and Art Department, enabled to obtain the instruction required for those several arts and trades. They are instructed not only in the abstract principles of the sciences applicable to the several industries, but also in their practical application. For instance, the engineer is taught mathematics, geometry, machine construction, and applied mechanics; the miner is taught geology, mineralogy, metallurgy, mechanics, and the principles of mining; the mariner is taught astronomy, physical geography, mathematics, navigation, and steam.

That a similar arrangement is required for agriculture; and your memorialists now respectfully and earnestly ask that it shall as soon as possible be sanctioned.

That what has already been done for engineering, machine-making, ship-building, mining, navigation, and other great industries, your memorialists ask to be done for the not less important industry of agriculture.

That with this view your memorialists ask that the grants of the department shall be declared to cover instruction in chemistry, mechanics, physiology, botany, morphology, steam, and other scientific subjects, when taught in the abstract, in so far as necessary for agriculture; and also to cover instruction given in the "principles of agriculture" as an applied science, and to place it in the same position as "machine construction," "applied mechanics," the "principles of mining," and "navigation," which are already included in the list of scientific arts towards instruction in which aid is given and in which examinations are carried out by the department.

That your memorialists are happy to be able to state that there are many schools in Scotland into which the instruction now referred to will be at once introduced, if the department accedes to the application made by your memorialists.

May it therefore please your Lordships to take the premises into your favourable consideration, and your memorialists will ever pray.

(Signed) ROBT. A. B. TOD, Chairman.
Edinburgh, 14th July, 1874.

To this memorial the following answer has been received:
Science and Art Department,
London, S.W., 15th August, 1874.

Sir,—I am directed by the Lords of the Committee of Council of Education to inform you that their Lordships have had before them your letter of the 14th ultimo, forwarding a memorial from the Highland and Agricultural Society of Scotland, and in reply I am to state that while their Lordships are disposed to accede to the request contained therein, it is too late now to include for this year the science of agriculture in the list of subjects towards instruction in which aid is granted by this department. The case is therefore reserved for future but early consideration. I am, however, at the same time, to point out that the branches of general sciences, such as chemistry, mechanics, physiology, and botany, &c., which must form the foundation of any course of instruction in agriculture, are already aided, both in elementary schools and by the Science and Art Department. These subjects must to a certain extent be mastered by all students who intend to take up the applied science of agriculture. I am to add that the best means of giving effect to the suggestions of the Highland and Agricultural Society will be carefully considered.—I am, sir, your obedient servant,
(Signed) NORMAN MACLEOD.

F. N. Menzies, Esq.
A letter was read from the Society of Arts, London, as to examinations in "the technology of agriculture."
STIRLING SHOW, 1873.—Two-year-old Polled Heifers: The

second and fourth premiums, awarded respectively to Mr. McCombie, M.P., Tillyfour, for Pride of Alford, and to Sir George Macpherson Grant of Ballindalloch, Bart., for Eva, have been forfeited, owing to the animals having failed to produce calves within the specified time. The second premium has been transferred to the Earl of Fife, for Heather Blossom, which stood third. Two-year-old Galloway Heifers: The first and fourth premiums, awarded respectively to the Duke of Buccleuch for Melantho, and to Mr. Graham, Percelstown, for Hermione, have also been forfeited for the same reason. The first premium has been transferred to Mr. Cunningham, Tarbreoch, for Favourite, and the second to the Duke of Buccleuch for Mellona.

INVERNESS SHOW, 1874.—The secretary stated that the Local Committee had on 1st September last resolved not to proceed with the trial of reaping machines selected for trial at the show.

The subject of hefting was before the board, and after some consideration was referred to the General Show Committee to draw up more stringent rules on the subject.

It was remitted to the Committee on General Shows to arrange the premiums and adjust the regulations for the show to be held at Glasgow next year.

Requisitions addressed to the directors to hold the general show at Aberdeen in 1876, from the counties of Aberdeen, Banff, and Kincardine, and the town of Aberdeen, were laid before the meeting, and remitted to the Committee on General Shows to prepare the classes of stock for which premiums should be offered.

The minute of the Committee on Steam Cultivation of date 2nd September, containing the resolution of the committee not to hold the proposed exhibition of steamcultivators this autumn, in consequence of there being no entries, was read and approved.

The secretary reported that the preliminary examination of students for the Society's veterinary certificate took place on the 14th and 15th July, when 37 students entered their names for examination—namely 10 from the Edinburgh Veterinary College, 14 from the New Veterinary Edinburgh College, and 13 from the Glasgow Veterinary College, and that only six failed to pass.

The following remits were made: To the Committee on Office-bearers, to report on vacancies and suggest list for 1875; to the Committee on Essays and Reports, to read and report on papers lodged in 1874, and to revise the list for 1875; to the Committees on District Competitions and on Cottages and Gardens, to revise the awards for 1874 and consider the applications for 1875; to the Committee on General Shows, to consider and report on letters from the Marquis of Tweeddale, proposing to offer premiums for turnip thinners and manure distributors; and from Mr. Davidson of Tulloch, on having separate classes for Highland ponies.

The premium awarded to Mr. James Lawrence, Mills of Forbes, and to Mr. Alexander Winton, Viewhill, for the second and third best mares at the local competition held at Inverness in August 1873, were forfeited, the mares having failed to produce foals within eleven months of the date of competition.

A letter was read from Overintendant Hammerherre Holst, Chamberlain of his Majesty Oscar II., and Director of the Central Agricultural School of Norway at Oas, expressing his deep gratitude for having been elected an honorary associate of the Society at its last general meeting.

GREENHILL FAIR.—Shepherds who attended with their flocks from long distances started from home two or three days, or even a week, before the fair, driving their charges a few miles each day—not more than ten or twelve—and resting them at night in hired fields by the wayside at previously chosen points, where they fed, having fasted since morning. The shepherd of each flock marched behind, a bundle containing his kit for the week strapped upon his shoulders, and in his hand his crook, which he used as the staff of his pilgrimage. Several of the sheep would get worn and lame, and occasionally a lambing occurred on the road. To meet these contingencies there was frequently provided, to accompany the flocks from the remoter points, a pony and wagon into which the weakly ones were taken for the remainder of the journey. When the autumn sun slanted over Greenhill this morning and

lighted the dewy flat upon its crest, nebulous clouds of dust were to be seen floating between the pairs of hedges which streaked the wide prospects around in all directions. These gradually converged upon the base of the hill, and the flocks became individually visible, climbing the serpentine ways which led to the top. Thus, in a slow procession, they entered the openings to which the roads wended, multitude after multitude, horned and hornless—blue flocks and red flocks, and flocks and brown flocks, even green and salmon-tinted flocks, according to the fancy of the colourist and custom of the farm. Men were shouting, dogs were barking, with greatest animation, but the thronging travellers in so long a journey had grown nearly indifferent to such terrors, though they still bleated piteously at the unwontedness of their experiences, a tall shepherd rising here and there in the midst of them, like a gigantic idol amid a crowd of prostrate devotees. The great mass of sheep in the fair consisted of South Downs and the old Wessex horned breeds. These filed in about nine o'clock, their vermicated horns lopping gracefully on each side of their cheeks in geometrically perfect spirals, a small pink and white ear nesting under each horn. Before and behind came other varieties, perfect leopards as to the full rich substance of their coats and only lacking the spots. There were also a few of the Oxfordshire breed, whose wool was beginning to curl like a child's flaxen hair, though surpassed in this respect by the effeminate Leicesters, which were in turn less curly than the Cotswolds. But the most picturesque by far was a small flock of Exmoors, which chanced to be there this year. Their pied faces and legs, dark and heavy horns, tresses of wool hanging round their swarthy foreheads, quite relieved the monotony of the flocks in that quarter. All these bleating, panting, and weary thousands had entered and were penned before the morning had far advanced, the dog belonging to each flock being tied to the corner of the pen containing it. Alleys for pedestrians intersected the pens, which soon became crowded with buyers and sellers from far and near.—*The Cornhill Magazine.*

THE SO-CALLED CHAMBER OF AGRICULTURE.—It has given us little else but a discussion on the exceptional burdens of the landed proprietor and on the means by which in future he is to get off more cheaply. Just as reasonably might the Manchester manufacturers have confined themselves to the hardship of tonnage-dues, or to the unjust incidence of the Income-tax on the profits of trade. We will not conclude unfairly, that the members of the Chamber of Agriculture are at all more really selfish than the rest of us; but we may say without offence, that they might more appropriately, and with more justice to themselves, have shown a less narrow range of interests.—*The Times.* If there were one organisation more than another where the land tenancy question might be expected to appear, it is the so-called Chamber of Agriculture, which is now to be met with nearly everywhere. But, in England at any rate, these societies are almost exclusively engaged about taxation topics, such as Highway Legislation and those other incidents of the land which affect the parish or the county rate. These are, no doubt, important subjects; but it is plain that they are far more important in the long run to the owner of the land than to the owner of the capital employed upon it.—*The Agricultural Gazette.*

SEWAGE DIFFICULTIES.—Troubles come in legions to our local boards. The difficulty of getting rid of sewage appears to increase rather than decrease day by day; and it is now evident that Parliament must, at a very early date, reconsider the whole state of the law as regards sanitary questions.—*The Engineer.*

PRESENTATION TO MR. J. B. BOOTH.—The Bedale Hunt has presented the master, Mr. J. B. Booth, of Killerby Hall, a solid silver centre-piece, with richly-chased rustic base and groups of figures representing a huntsman holding a fox, with the hounds surrounding him, and the following inscription: "Subscribed for and presented to Mr. John B. Booth, on his marriage, by the members of the Bedale Hunt and other friends, as an assurance of their good wishes, and as a mark of esteem and gratitude for his services as master of the Bedale hounds." There was also a pair of dessert stands to match these, with the silver hunting horn presented to Mr. Booth on the 28th of April last, and a bracelet presented to Mrs. Booth, set with pearls and pink coral, the cost of the plate and hunting horn being 200 guineas, and the bracelet 40 guineas. The Earl of Feversham made the presentation.

M A N U R E S.

The following paper was read by Mr. JOHN LEIGH, Medical Officer of Health for the City of Manchester, at a meeting of the Manchester Farmers' Club, from whose Journal we take the full report.

Before proceeding with the special subject of my address, will you pardon me if, for a few moments, I carry you back into the past, so that we may regard the present with some intelligible idea of how it is that things are as we now find them? There has been a time in the history of this globe during which there is strong reason to believe it existed as a red-hot, glowing, incandescent mass, the ocean surrounding it not as a liquid, but as a vast gaseous atmosphere. Such is the condition of the sun at the present moment, so far as astronomers can make out; and such, it is probable, is the condition of several of the planetary bodies of our solar system, notably of Jupiter and of Saturn. Everything that was capable of being raised into vapour by the most intense heat existed in that condition, just as we find that the sun's atmosphere at this time contains the elements of most, if not all, of the earth's constituents. A very distinguished French philosopher, M. Hor. Deville, has shown, by a series of beautifully-devised experiments, that at a very exalted temperature not only is there no tendency of different bodies to unite chemically with each other, but that even bodies already combined, and having a strong chemical affinity for each other, tend to become separated, or, as he has expressed it, to be dissociated. It is tolerably certain, then, that in this condition of things there would be no water on our globe, but only the elements of water existing as separate gases in the atmosphere. There would be no alkalis or earth, no clay, lime, or sand, but only the metallic bases of these, no rocks or soil of any kind. Everything liquid or solid (if solids, indeed, could exist) would be in the metallic state, with the exception of the few substances not recognised to be metals, as carbon, silicon, &c. As the earth cooled, by the radiation of its heat into space, the conditions necessary for the exercise of chemical affinities would be attained, and mainly by the powerful chemical tendencies of oxygen, the metals, with carbon, silicon, &c., would be burned; alkalis and earths would be formed; oxygen and hydrogen would enter into combination to form water, with such explosions as might well rend a world asunder. As the cooling went on, crusts of earth would be formed, broken through from time to time by outbursts of lava, even as takes place at this time from our volcanic outlets. In time the waters gathered in the hollows of the earth, seething and hissing through many a long millennium; the crust of the globe thickened, washed and abraded by the roaring seas, and the rain fell, and through countless ages the uplifted masses of strong rock were worn away and laid in beds in the depths of the ocean. And slowly, from time to time, these beds rose to the surface and became dry land, and the seas flowed over other lands; and in their turn these lands were washed into the sea, and so on and on, through such myriads of years as seems almost for ever. The surface of the earth, then, as we find it, is composed of rocks formed at the bottom of the sea, or projected from the interior as lava through the mouths of volcanoes (though some of these lavas have also been poured out in the sea depths), or of rocks which, though formed by sedimentary deposition at the bottom of the sea, have been so acted upon and altered by the internal heat of the earth as to have become crystalline (the metamorphic rocks), such as the white crystalline limestone, saccharine or white marble, which may have originally been chalk, the crystalline schists, and possibly granite, with many others. Thus we have our great thicknesses of sandstone, limestone, chalk, schists, shales, granites, greenstones, serpentines, porphyries, and the numerous other rocks which come up to the surface in various parts of this and other countries. But we have in this part of our country also great beds of clay, marl, loam, sand, and gravel; and we find that at this day beds of this kind are being formed by the grinding, wearing, powdering action of vast glaciers in Greenland, Norway, Switzerland, and elsewhere, where vast caps of ice have for thousands of years covered the lands; and it is assumed, on evidence now beyond dispute, that these beds of ours were formed by similar action. The hard and impenetrable rocks, worn and abraded by the irresistible filing and

rasping of vast moving masses of ice, have yielded a mud, when we had another climate to this, which was deposited in the plains and valleys it is now your business to cultivate. Sand and gravel have been formed more of less out of this by subsequent washings of brooks, rivers, or the sea. Many times, however, in the earth's history has the land been covered with vegetation, and then great beds of coal have been formed for us. In this part of the country the surface has chiefly been formed by ice action. But even yet all was not accomplished. The wind, the ocean, and perhaps birds, brought the seeds of plants from other lands to these new beds; and the seeds germinated, and the plants grew, drawing nourishment from the air, flowered, and formed fruit. These withered and decayed, leaving in the soil a portion of the food they had taken from the air, in repayment of the support they had received. And as the green herbage spread over the land came herds and flocks to crop its freshness, manuring the land they roamed over, and leaving their bones upon the soil. Thus in the long centuries was formed the rich black mould which, in a covering of variable thickness, forms the basis of modern culture. No doubt it strikes you, gentlemen, as it does me, that there is something wonderfully beautiful and beneficent in all this. How reckless of time the Maker hath been, how vast the agencies He has employed, how mighty the implements in fitting the earth for our occupation, and how beautiful and symmetric are the results! I am reminded of a fine idea of Professor Hamsay, the Director of the Geological Survey, who says that, in trying to carry his mind back to the period of even one of the latest great geological changes, it seems to him like trying to measure the distance of one of the remotest fixed stars faintly glimmering in the far horizon, whose light, travelling at the rate of 200,000 miles per second, has taken thousand of years to reach our eyes. With this brief introduction, let us now consider what it is that we have to deal with. We have a soil ready formed to our hands, special plants to cultivate, flocks and herds to feed. The flocks and herds depend upon the plants; the plants upon the soil. How can we best maintain the fertility of the soil; how enrich it when it has become impoverished? We may dismiss the herds and flocks for a moment, and consider how the plants feed. The food of plants may be considered under two heads—air-food (by which I mean the food extracted from the atmosphere), and root-food or earth-food, though the latter includes a portion of the former. The organs by which the air-food is received are chiefly the leaves; the small fibrils of the roots imbibe the earth-food. Nothing enters the plants in a solid condition. The air-food, with the exception, perhaps, of water, is all gaseous; the root-food all liquid. Any liquid food imbibed by the roots is of matters in absolute solution, clear and transparent. From the atmosphere plants take, by the leaves, carbonic acid, ammonia, and water; from the soil, by the roots, carbonic acid, salts of ammonia, nitrates, and certain mineral matters, varying in quantity with the species of the plants, and, to some extent, with the nature of the soil on which they grow. A considerable quantity of the air-food, or that which plants derive from the atmosphere, is carried down to the soil by rain, in which carbonic acid and the salts of ammonia are soluble, and these are afterwards imbibed by the roots. The chief salt of atmospheric ammonia is carbonate. In the neighbourhood of towns small quantities of sulphate, muriate, and nitrate of ammonia are also found. All the atmospheric ammonia is probably derived from the decomposition of animal and vegetable bodies and from volcanoes. Much of the carbonic acid is probably due to the same sources. Liebig, from whom we have learned to differ in some particulars, from our enlarged experience, but who was one of our greatest agricultural teachers, taught us to find the ammonia in the atmosphere by analysing a shower. The rain, as it fell, dissolved the ammonia salts it found in the air; and Liebig, by distilling the water, extracted the salts. In dry weather, then, there will be more of the salts of ammonia in the atmosphere than in wet weather, but they are not brought in considerable quantity to the plants, being diffused through a large body of air, and largely occupying higher strata of the atmosphere. Nevertheless, winds and currents of air assist in

bringing the ammonia salts and carbonic acid into contact with the plants. The leaves are the true lungs of plants. If you examine the under surface with a microscope you will find it studded with thousands of little oval valvular openings communicating with the interior of the leaves. Animals take in solids and liquids by the mouth, and exhale into the atmosphere by the lungs carbonic acid, and pass to the earth by the kidneys ammonia in the form of urea. Plants drink up by the roots and the leaves ammonia and carbonic acid, and exhale into the atmosphere by their lungs (the leaves) oxygen, and store up in their organs starch, gluten, oil, sugar, and other substances which they have elaborated from the ammonia and carbonic acid. Thus to a certain extent we find the materials for *their* life, and *they*, to a larger extent, for *ours*. We shall now be able to answer the question how it is that plants in the neighbourhood of large towns generally, and in that of Manchester especially at the present time, look brown and unhealthy and drooping, utterly unlike the bright, clear green of the country, even at this dry season. It is that the pores of the leaves, those beautiful little valvular openings of which I spoke, are clogged up by smoke (which is only soot and tar), and dust and dirt, and they cannot breathe. They are suffocated by solid particles; their juices are poisoned by the corrosive vapours poured out by our chemical manufactures and from our chimneys. With less rain than we ordinarily have, our suburban trees would cease to live, and even in our greenhouses incessant washing is necessary to preserve our plants in health. From the earth plants drink up by the rootlets not only carbonic acids and the salts of ammonia, but phosphates, silicates, sulphates, nitrates, muriates, the salts of potash, soda, lime, magnesia, iron, and manganese. These are as necessary to the healthy growth of the plants as the carbonic acid and ammonia. Without these the latter cannot be assimilated so as to produce luxuriant vegetation. Silicate of potash forms the outer skeleton or coating of straw and of the stalks of grasses; phosphates are found in the seeds largely, and in root crops; magnesia in the husks; potash, soda, lime, iron, and manganese almost everywhere. Why do brass-polishers use burnt straw to polish their metal? Because of the finely-divided flint that the ashes contain. Yes, the outer coating of straw, that which it such a smoothness to the touch, such a polish to the eye, is flint, or sand, or crystal, for they are all the same. It is spread over it as a beautiful varnish, impervious to moisture, so that when the rain falls upon it it may glide over it and run down to the ground. Were it otherwise, and the stem became sodden and wet with rain, it could not sustain the weight of the ear; but the straw is a hollow column or shaft of the strongest form, bulging slightly in the centre, strengthened by bands at intervals, and varnished to protect it from injury. The ear is an overhanging cone, bristling with sharp points to split up and turn aside the drops of rain, and the grain has an extra tight-fitting coat of extra strength and thickness. Plants in a state of nature die on the soil in which they grow; and in their decay leave behind them in the soil a portion of the matter they have extracted from the atmosphere. Hence the formation, extending through a long course of ages, of that dark brown or black deposit which covers so large a part of the earth's surface, in varying depths, called humus or mould, and which mingled with clay or sand constitutes black or dark loam, and, with clay and lime, marl. That this humus or mould is organic and derived from the prolonged growth and decay of vegetation is evident from its combustibility. It may be burnt away, leaving the mineral matter behind. To a slight extent it is soluble in water. Its solubility, however, is much increased by the presence of alkalis, as potash, or soda. It does not seem, however, even when in solution, to be taken up with certainty by plants, as its solution is of a dark brown colour; whereas the juice or liquid contained in the extremest rootlets of plants is colourless, with the exception of a few milky juiced plants. It is capable of combining with ammonia, and has therefore, probably, acid properties; indeed, the ammonia can be separated from it by stronger acids. It is probable that it is, even when in solution, or when combined with ammonia, converted by oxidation into carbonic acid before it is absorbed by plants. It has very powerfully the property of condensing ammonia from the atmosphere within its pores, and of slow conversion into carbonic acid by the oxygen of the air. It is probable that its chief utility in the soil is in the absorption of the ammonia, and the gradual yielding of carbonic acid. Its

power of condensing oxygen also from the air, by which its conversion into carbonic acid is accomplished, and by which possibly the ammonia salts may be partially converted into nitrate, is to be considered. At the first glance it may seem that the presence of this humus or mould in the soil should be sufficient for the growth of plants, and to a certain extent it is; as witness the pampas, the llanos, and the savannahs of America, where vast crops of vegetable matter, extending over thousands of miles, are yielded every year, the grave of the one crop being the cradle of the next. But here the plants are never removed; they furnish their own manure. All over the world plants of a certain limited luxuriance spring from this foster-mother, unaided by external appliances. Nevertheless, we have discovered, at a very early period of human history, that by breaking up the humus or mould, mixing it well into the subjacent soil, and loosening its texture, we can increase its fertility; and hence one reason of the operations of ploughing, harrowing, &c. By these operations we increase its porosity, by which it can absorb a larger quantity of ammonia from the air; we expose a larger surface to the air, by which a larger portion can be converted into carbonic acid, and we mix it well with the mineral soil, the constituents of which can be brought to the rootlets of the plants. Thus, so far as the humus or mould is concerned, the utility of ploughing, harrowing, and otherwise breaking up the soil is obvious. For the same reason deep draining is valuable. Water is capable of holding in solution a certain fixed quantity of oxygen. When lying on the soil this is very rapidly extracted by the decaying matter underneath, whether humus or manure, for the production of carbonic acid. When it has thus lost its oxygen it simply drowns and suffocates the plants, by preventing the access of the oxygen of the air to the matter surrounding the roots of the plants, and they thus become both starved and suffocated. I often hear the injurious effect of stagnant water explained by its coldness; but it is not this so much as the prevention of the access of air about the roots. Rain-water and running water is charged with ozonised oxygen, which it imparts to the decaying matter over which it flows; and oxygen in this state has a much more powerful and vigorous action in the conversion of decaying matter into carbonic acid than ordinary oxygen. Once that it has parted with it, however, it should get away as rapidly as possible. All stagnant water is injurious, for whilst running water oxidises, stagnant water produces putrefaction. In civilised countries, where the population is large and the land is limited, and where it is necessary that the latter should produce its maximum result, the humus or mould in the soil is found to be insufficient for the work required of it, and especially is this the case when the matters absorbed from the soil by the plants grown upon its surface are not returned to it. Hence the attempts practised in all ages within human history to supplement its natural action by additions made to it in the form of manures. These have been, and are very various in composition, qualities, and effects. In some, special adaptation to the soil has been attempted, in others to the crops. It has been observed that certain plants grow better on some soils than on others. Some are found to flourish best in limestone countries, others on chalk, some on red sandstone, and others on a granite soil. Some effect a rich marl, and others a mellow loam. An analysis of their ashes shows a corresponding proportion of their favourite minerals, and hence some attention has been given to the mineral constituents of soils in relation to plants, and by Liebig especially it was very minutely studied, and its importance in connection with manures somewhat exaggerated. He reasoned himself into a belief that the amount of ammonia and carbonic acid capable of being absorbed by the leaves of plants, with that taken up by the roots from both of these, condensed in the soil, was sufficient for the most luxuriant plant-life, and that it was only necessary to add to the soil such mineral ingredients as have been removed from it by any vegetable crop to secure a perpetuation of its fertility. The experiments of Bonsingault and of Gilbert and Lawes fail to bear out Liebig's hypothesis. They found that these minerals, unaccompanied by carbonic acid and ammonia-producing materials, were productive of very trifling effects. It was necessary that abundance of nitrogenous and carbonic materials should be applied to the roots, in addition to these, for the production of high fertility. The most important mineral elements appear to be phosphates, and silicates, and salts of potash. It would

appear that the form in which nitrogen should be applied to the soil is not necessarily that of ammonia, since nitrate of soda and nitrate of potash form very stimulating manures. The form in which nature seems to have intended manures to be applied to the soil is in that of animal excreta, and especially those of carnivorous animals. But the herbivora are themselves food to the carnivora, and unless the excreta of the latter are returned to the soil, this will lack a large part of what it has given. The excreta of herbivorous animals contain comparatively little nitrogen or phosphates, whilst those of the carnivora are rich in these. In civilised countries flocks and herds consume the grass, nations consume the flocks and herds. The cattle and sheep are removed to the towns, and not even their bones returned to the soil. Their excreta, mixed with straw, and forming farm-yard manure, are put upon the ground, but as these do not contain, by the amount of the bulk of the animals producing them, to say nothing of their condensed composition, what has been taken from the soil, it has been found necessary to supplement them by the purchase of extraneous manures—such as guano, sulphate of ammonia, nitrate of soda, phosphate of lime, and a host of other compounds; but the best of all these is guano. The operations of agriculture are as important in bringing into utilizable condition the mineral constituents of the earth's surface as in their effects on the humus or mould. All the mineral food of plants is contained in greater or less abundance in the soil, the richest soils being furnished by the *debris* of some of the hardest rocks, especially the volcanic. By ploughing and exposing the under-soil to the action of frost, the soil becomes disintegrated or reduced to finer powder, and so made more amenable to the solvent power of rain; and thus the phosphates, potash, silica, &c., are made available to the plants. By alteration of crops and by lying fallow the same object is assisted, time being allowed for the liberation of the essential ingredients of particular crops by their non-absorption during fallow, or by putting crops on which do not require them. By manures we understand substances which, being put upon the soil, restore to it the matters which have been taken away from it by flocks of sheep and herds of cattle, and by the removal of crops of grain, of roots, and of hay, and which have the effect, if we may use the expression, of fattening the crops which spring from it, or of giving to them luxuriance of growth and richness of composition; for these conditions, as it appears to me, are necessary for the full development, and rich condition of the stock that feeds upon them. For several years I received from the late Mr. Leigh, of Lyme, a piece of wild beef from the wild cattle for which the park at Lyme has long been celebrated. They lived, and I suppose still do so, in the outer park, which was entirely uncultivated, and appeared as if it had never been otherwise, except in so far as it was manured by the cattle themselves, which were too few materially to have affected the surface. The beef, though very agreeable to the taste (at all events I liked it), was not fat, but mottled. It was lean and dark in colour, and had quite a different appearance to the bright red rich-looking and fat beef from our highly-cultivated pastures. The pasture on which the wild cattle lived was coarse and wiry and wanting in greenness. The want of fat was not from any excessive activity on the part of the cattle, for they always seemed to me to lead very quiet, easy, contented lives, perfectly satisfied with things as they found them, and by no means disposed to indulge an idle curiosity respecting other lands. When plants are burned they leave behind a quantity of ashes, and these ashes represent the indestructible, or rather fixed, mineral matters which the plants have extracted by their roots from the soil. Now, these minerals are those which are essential to the healthy growth of the plant, and the existence of which in the soil is essential to its fertility. They are the materials about which it may be said the organic atoms built up of the elements of carbonic acid water and ammonia are aggregated. They are part of the fabric of the plant; they strengthen and support it. No doubt they influence the formation of the organism of which they form a part in the grain, the straw, the blade, and the root. All soils are sterile without them, all fertile soils contain them. In what exact condition they exist in the plant—that is, in what state of chemical combination—I do not think has yet been sufficiently determined. In the very process of analysis some of the organic acids with which they may have been in combination are destroyed, and they are found in the ash united with carbonic acid, whereas in the plant they probably existed in a much more complex state of union. Moreover, the relative

proportions of the elements of the ashes differ in the plants, varying with special circumstances. Nevertheless, the mineral elements themselves, if varying in quantity, differ little in kind, and the analyses that have been made represent them with sufficient accuracy. Fresenius found in the ashes of

We now see what are the materials in the soil most important to vegetation. I have given you the analyses of the ashes of the chief crops you cultivate. The mineral matters are very few. They are—phosphoric acid, sulphuric acid, potash, soda, lime, magnesia, chlorine, iron, manganese, and silica. Of these the manganese, iron, magnesia, soda, and chlorine are found in the plants only in small quantities, and will always exist in sufficient abundance in the soil. The silica exists abundantly, but not always in sufficient quantity in the soluble form. Hence the occasional necessity for putting quicklime on the land on which grain crops or grass crops have to be cultivated, as the lime renders the silica soluble, so that it

can be taken up by the rootlets, and we have seen that these crops require a deal of silica. The lime is also useful against slugs and snails. In the experiments of Messrs. Lawes and Gilbert, at Rothamsted, wheat was grown on the same land for twenty years in succession without any manure being added to the land. The following was the amount of ashes or of mineral matter removed from the soil by each annual crop, averaging the whole:

AN AVERAGE ANNUAL CROP.

	Total produce.		
	lbs.	Corn. lbs.	Straw. lbs.

Magnesia	3.87	1.98	1.89
Sulphuric acid	2.59	—	2.59
Chlorine	1.89	—	1.89

Lime and magnesia exist in most soils in sufficient abundance. They are taken up by the plants as bicarbonates and sulphates. The carbonates are soluble in water charged with carbonic acid, and the sulphates are sufficiently soluble without any addition to them. The sulphuric acid of plants, except when sulphate of ammonia or other sulphates are added to the soil, is probably all derived from the sulphate of lime in the soil. What, then, are the materials removed in largest quantity from the soil? Why, by grain crops—silica, phosphoric acid, potash; by grass crops—silica, phosphoric acid, magnesia; by clover—phosphoric acid, potash, lime; by peas and beans—phosphoric acid, potash, magnesia, lime; by turnips—potash, phosphoric acid, lime; by cabbage—potash, phosphoric acid, lime; by swedes—potash, phosphoric acid, lime; by potatoes—potash, phosphoric acid, magnesia. The object of cultivation, then, is to liberate the soluble silica in the soil, that is, silica in combination with potash or soda, by ploughing, and otherwise breaking up the soil, assisting the action occasionally by dressings of lime (the disintegration giving the rain access to the soluble silica), to supply the soil abundantly with phosphoric acid, and with potash or soda, with salts of ammonia, and carbonic acid-producing materials in the shape of manures. Farm-yard manure contains, perhaps in greatest variety, the materials extracted from the soil and required to be returned to it. Composed of the dung of horses and cows, mixed with their urine and with the straw, which have served for their bedding, it necessarily contains all the matters extracted from the soil by these animals, less those contained in their own bodies. The straw and other similar substances in their decomposition yield carbonic acid and silicate of potash. But, inasmuch as their bodies do not return to the soil, and they carry away with them a large quantity of the soil extract in a very concentrated form, the farmer has to make up for the loss by the purchase of equivalent quantities of extraneous manures, these being chiefly sulphate of ammonia, nitrate of soda, phosphates of lime, soluble and insoluble, and other phosphates, bones, both unexhausted of their gelatine and with the gelatine extracted, guano, natural and artificial, and a host of compounds under various fancy names. The sulphate of ammonia, nitrate of soda, phosphates of lime, and bones, though all exceedingly valuable, yet only supply their own particular ingredients, and not all the elements required by the partially exhausted soil, and which, properly intermingled and combined, are necessary to the composition of a true manure. Of the substances used, good natural guano fulfils these conditions the most fully, having all the materials required except that for the production of carbonic acid. From the latter consideration it might be best to use it in conjunction with farm-yard manure, or at least with rotting straw. Guano consists of the dung of birds, in this case both urine and feces, as they are discharged by the same orifice, the urine becoming solid soon after its discharge. Hence guano is to a large extent simply solid urine, and hence its great richness in ammonia and phosphates. The birds producing guano are carnivorous, and the urine of all carnivorous animals is exceedingly rich in these two, ammonia and phosphates. The nearest approach to guano available for agricultural purposes is afforded by human urine, the composition of which, if evaporated to dryness, would be very similar to that of guano.

Phosphoric acid	11.73
Lime	8.17
Magnesia	0.42
Potash.....	3.84
Soda	12.64
Sulphuric acid	14.41
Oxalic acid	12.54
Chlorine	1.81
Water, sand, and humus	28.97

These analyses of guano all tell the same tale. They are, if genuine, mainly and essentially composed of salts of ammonia, phosphates of lime, with a little magnesia, alkaline phosphates, and sulphates. Now listen to the composition of human urine, according to Berzelius :

100 parts of the solid residue of human urine contain—

Urea	44.39
Uric acid	1.49
Muriate of ammonia	2.23
Lactate of ammonia and animal matters	25.58
Phosphate of soda and ammonia	6.85
Phosphates of lime and magnesia	1.49
Sulphates of potash and soda.....	10.26
Chloride of sodium.....	6.64

Now, the 44.39 parts of urea are equal to 57.72 parts of carbonate of ammonia, or to 25.2 of pure ammonia, to say nothing of the ammonia represented by the uric acid, muriate of ammonia, and animal matters. There is no guano so rich in ammonia as the dried human urine. Let us classify the contents according to Berzelius :

Urea.....	30.0	to 50.0
Uric acid	1.5	” 1.6
Extractive matters, ammonia, salts and chlorides... ..	26.0	” 50.0
Alkaline phosphates	5.5	” 6.8
Earthy phosphates	1.5	” 2.0
Alkaline sulphates	8.2	” 11.5

It is like reading an analysis of the richest guano, except that it is richer than guano in all but the earthy phosphates. Let us now see what is the proportion of these earthy phosphates in the other human excretion. Enderlin analysed dry human fæces, and found in 100 parts :

Phosphate of lime and magnesia	80.37
Sulphate of lime.....	4.53
Silica	7.94
Phosphate of iron	2.09
Phosphate of soda	2.63
Alkaline sulphate and chloride.....	1.36

So that nearly 83 per cent. of the ash of human fæces is composed of earthy phosphates. No manure can equal, in all the richest fertilising materials, such a compound as would be formed by these mixed excretions, if all the ingredients were preserved. A very distinguished French philosopher, M. Bousingault, a gentleman of large landed estate, a profound geologist, and a skilful chemist, has devoted himself during many years to the scientific statistics of agriculture. In conjunction with his friend, M. Payen, amongst other works he examined a very large number of materials that have at various times been employed in agriculture, with a view to test the relative quantity of nitrogen that they contain. I have selected the following numbers from his table :

Table of the comparative values of manures experimentally determined by MM. Bousingault and Payen. All the materials are estimated as dry, and the numbers indicate the proportion of nitrogen in 100 parts of the dried substances :

Farm-yard dung.....	1.95
Dung from an inn yard.....	2.08
Solid cow dung	2.30
Urine of cow	3.80
Mixed cow dung.....	2.59
Solid horse dung	2.21
Mixed horse dung	3.02
Sheep dung.....	2.99
Horse urine	12.50
Guano imported into England	6.20
” ” ”	7.05
” ” ” France	15.73
Urine of the public vats (human).....	23.11

Some time ago I collected the urine of an average family of six persons—that is, of a family of adults and children—taking the morning and evening urine. I introduced four gallons of the fresh urine into a large glass retort, and distilled it off to dryness. An immense quantity of carbonate of ammonia distilled and sublimed over. On saturating it with sulphuric acid, and evaporating to dryness, I obtained 17½ ounces of sulphate of ammonia. The matter remaining behind in the retort I washed with boiling water, and on evaporating the washings, obtained 395 grains of soluble phosphates, sulphates and chloride. The insoluble matter still left

in the retort weighed 167 grains, and consisted chiefly of phosphate of lime. The essential element of ammonia is nitrogen, and as this element exists both in guano and other animal excreta, as well as in almost all natural manures in other forms of combination than as ammonia, becoming resolved into this somewhat simple compound by the decomposition of its more complex associations, it has become customary to express its presence and amount in organic bodies, or in complex substances of organic origin, under the term “organic nitrogen.” Organic nitrogen is nitrogen capable of being converted into ammonia in the soil, and every 14 grains will produce 17 grains of ammonia.

POLLUTION OF RIVERS COMMISSIONERS' REPORT.—Röder and Eichorn give the following data respecting the amount and proportion of organic nitrogen in human excrements, their numbers being derived from the researches of Wolf and Lehmen.

Weight in grammes of solid and liquid excrements per person per day, and the organic nitrogen and phosphates contained therein (the gramme is nearly 15½ grains) :

	Fæces.	Organic Nitrogen.	Phosphates.	Urine.	Organic Nitrogen.	Phosphates.
Men	150	1.74	3.23	1,500	15.0	6.08
Women ...	45	1.02	1.08	1,350	10.73	5.47
Boys	110	1.82	1.62	570	4.72	2.18
Girls	25	0.57	0.37	450	3.68	1.75

POLLUTION OF RIVERS COMMISSIONERS' REPORT. Weight in avoirdupois pounds of solid and liquid excrements per person per year, and the organic nitrogen and phosphates contained therein :

	Fæces.	Organic Nitrogen.	Phosphates.	Urine.	Organic Nitrogen.	Phosphates.
Men	120.45	1.39	2.62	1,204	12.04	5.28
Women ...	36.08	0.81	0.86	1,083	8.61	4.38
Boys	88.33	1.51	1.29	457	3.79	1.73
Girls	20.07	0.46	0.29	361	2.95	1.40

POLLUTION OF RIVERS COMMISSIONERS' REPORT. Weight in hundredweights of the excrements of 100,000 persons (37,610 men, 34,630 women, 14,060 boys, and 13,700 girls) per annum, and the organic nitrogen and phosphates contained therein :

	Fæces.	Organic Nitrogen.	Phosphates.	Urine.	Organic Nitrogen.	Phosphates.
Men	40,372	468	881	403,730	4,027	1,638
Women... ..	11,045	250	263	334,541	2,653	1,354
Boys	11,067	183	161	57,354	481	217
Girls	2,453	56	36	45,012	360	171
	64,937	957	1,347	840,637	7,531	3,380

The River Pollution Commissioners, in their report on the Mersey and Ribble Basins, give a list of 22 towns in South Lancashire and North Cheshire, containing a population of about 1,330,000, in which are 120,000 privies and 45,000 water-closets. Of the water-closets, 30,000 are said to be in Liverpool alone. Towns : Ashton, Rochdale, Bolton, Bury, Oldham, Manchester, Salford, Warrington, Widnes, Runcorn, Liverpool, Blackburn, Chorley, Clitheroe, Preston, Southport, Stockport, Northwich, Macclesfield, Staleybridge, Glossop, and Wigan.

Weight of solid and liquid excrements and of organic nitrogen and phosphates per 1,330,000 persons, residing in the recited towns, per year, in tons :

Fæces.	Organic Nitrogen.	Phosphates.
tons.	tons.	tons.
43,291	638	894
Urine.	Organic Nitrogen.	Phosphates.
tons.	tons.	tons.
560,424	5,020	2,306
	5,658	3,200

Now, 5,658 tons of nitrogen are contained in 26,752 tons of sulphate of ammonia, which, at £17 per ton, comes to £454,784. The 5,658 tons of nitrogen is contained also in 6,870 tons of ammonia. If the average quantity of pure ammonia in good guano be estimated at 9 per cent., then the 5,658 tons of nitrogen in the excreta of the cited 1,330,000 persons would be equal to 73,330 tons of guano, for it must be borne in mind that the combined excreta contains all the

other ingredients of guano. And now let me request you to recall for a moment the statement of the Pollution of Rivers Commissioners, that the excreta of the 1,330,000 people residing in 22 towns of South Lancashire and North Cheshire, are received into 120,000 privies and 45,000 water closets; and the whole of these water closets, and all the privies, with the exception of the few that have been re-constructed on a better principle in Manchester and Rochdale, drain into the sewers of the respective towns, that the sewers discharge themselves into the rivers, and the rivers into the sea, carrying with them, dissolved in their waters and utterly irrecoverable, 73,330 tons of the finest guano. At the annual meeting of the Lancashire Farmers' Club and Chamber of Agriculture, held at Liverpool, May 28th, 1874, a paper was read by Mr. Thomas Rigby, the secretary, on "Lancashire farming: its favourable and adverse aspects." In this paper it is stated that of the 742,000 acres in the county from which returns were received, 103,000 were in corn crops, and 510,000 in green crops and grass, for pasture and hay. The live stock returned was 32,000 horses, 238,000 cattle, 348,000 sheep, and 39,000 pigs. Total of cattle, sheep, and pigs, 625,000 animals. Just fancy this vast number of cattle, sheep, and pigs taken off your land and driven into the sea, a large amount of the corn crops following in the same direction, for we consume the animals and the corn, and what they have taken from the land, being the substance of their whole bodies, we do not return to it. They all pass away in our excreta. From the water-closets nothing is recovered, and the night-soil that is collected contains not a tithe of the fertilising matter that drains away from the privies into the

sewers, this being the urine, holding in solution, in addition to its own valuable constituents, all the soluble matter of the solid excreta. Thus are our towns underlaid by vast fever-breaking cesspools, whilst our polluted rivers roll their dark and fetid waters to the ocean, which flings back on its shores the foul accretion. And now I have to ask you to assist me, and those who are willing workers with me, the members of the Health Committee of this great city, by your intelligence, your careful observation and patience, and by your frank communications to me, in saving for your soil the vast wealth, the utilisation of which it has been my desire in this brief address to lay open to you, that your land may be enriched, and your crops be increased, that your brooks and your rivers, and your running streams may ripple and flow, pellucid and clear, as they left their native mountains. The soil is your servant, and a very willing servant. Treat it kindly and it will repay you with smiles and with bountiful thanks. Let the frost loosen its hard masses, and the air penetrate its depths; let the plough and the spade bring its buried treasures to the light and to the sun; let the rain in kindly streams permeate its mass, leaving its heaven-born riches behind, and run—its work of bounty done—back, unpolluted, to its parent sea. Render to it again that which it cannot spare, but which you want no more; give it back that which it punishes you for withholding in fever and diarrhoea and in countless ills, and it will repay you with smiling crops of grain, gladdening the eye as it waves in the golden sunlight, and in rich fields of herbage, that fills the air with the fragrance of its dying breath as it yields to the scythe.

THE SEWAGE OF TOWNS, VILLAGES, AND COUNTRY HOUSES.

BY MR. J. BAILEY DENTON, C.E.

[The following paper was taken as read at the Social Science Congress in Glasgow.]

It having been suggested to the author of this communication by the authorities of the International Exhibition at South Kensington that he should illustrate the process known as "Intermittent Downward Filtration," as suggested by Dr. Edward Frankland, and first carried into practice by the author at Merthyr Tydvil by an example to be daily in operation in the western annexe of the Exhibition, it may be opportune to state briefly, for the consideration of the Association, the results obtained from it during the time it has been in operation. London sewage is delivered daily to the several exhibits of sewage treatment by the authorities of the International Exhibition, independently of the exhibitors. The quantity delivered to the author for treatment by intermittent downward filtration has been 25 gallons daily (except Sundays). This sewage has been distributed each day over the surface of three cubic yards of natural soil of a free description. Having filtered through the soil it is discharged as a clear effluent by a small outflow increased and diminished in volume as the sewage is applied. Owing to the necessarily limited character of the exhibit it was anticipated that the purification of the sewage by the soil would become less efficient the longer it was used. It will be seen, however, from the following analysis that the contrary effect has been the result. The sewage was first applied to the soil on the 23rd of June, 1874, and the application has been daily continued since that date, Sundays excepted. On the 30th of June, seven days after the first application, a sample of the effluent water was collected and sent to Dr. Benjamin Paul, F.C.S., for analysis, who forwarded to the author the following results—viz: Free ammonia '009 in 100,000 parts, organic nitrogen '049 in 100,000 parts. On the 10th of August, forty-eight days after the first application of the sewage to the soil, a second sample was collected and analysed by the same eminent chemist, when he reported the following results: Free ammonia '006 in 100,000 parts, organic nitrogen '038 in 100,000 parts. On the 14th of September, eighty-three days after commencement, a third sample of the effluent was taken, and of it Dr. Paul said that it was "even better than that of the 10th of August." This is shown by the following figures: Free ammonia '002 in 100,000 parts, organic nitrogen '022 in 100,000 parts. In order that these figures may be compared

with the standards of purity recommended by the Rivers Pollution Commissioners it may be stated that, disregarding free ammonia as of comparatively little importance, they considered that any liquid containing more than '3 part of organic nitrogen in 100,000 parts should be deemed inadmissible into rivers. In the supplies of drinking water to the metropolis by the eight companies the mean amount of organic nitrogen appears to be '028 in 100,000 parts. The improvement in the condition of the effluent water which these figures of Dr. Paul show is doubtless due, in a great measure, to the means taken to deliver and distribute the sewage on to the soil with regularity, each cubic yard of soil receiving precisely the eight gallons of sewage it is designed to absorb, cleanse, and discharge. This is effected by the use of the "self-acting sewage regulator," the object of which contrivance is to apportion and deliver the precise quantity of sewage which land, prepared for irrigation or for intermittent filtration, is designed to utilise and cleanse, and this is done independently of all supervision, and of the outflow of the sewers contributing the sewage, which may at one time be extremely copious, and at another little more than a dribble. The irregularity of discharge attending the sewage of small towns, villages, mansions, and all kinds of large establishments is found to be the great difficulty in dealing with those communities. Besides overcoming this evil and thereby reducing the comparatively heavy cost of applying small quantities of sewage to land, the regulator secures with certainty that intermittency of application which is so essential to purification. Moreover, the action of the regulator is automatic and requires no attendant at night or on Sunday. The sewage as it is discharged from the town, village, or mansion flows into a tank of a capacity to hold the quantity of sewage it is desired to deliver to a certain area of land at one time. This tank is provided with a syphon or self-acting means of discharge, and directly the liquid rises to a given level the outlet comes into action and the liquid is at once discharged. When the tank is emptied the discharge ceases and the sewage commences to fill the tank again, or another tank, as found desirable, slowly or quickly according to the rate of influx. The author having carried out with complete success the intermittent downward filtration works at Merthyr Tydvil, under order of the Court of Chancery, as a means of abating the nuisance arising from the pollution of the Taff—which after answering

their temporary purpose for three years may be discontinued at any time now that the wide breadth of the land which the local board had previously purchased for surface irrigation has been laid out and completed as a sewage farm—is anxious to bring before the Congress this treatment as an effectual way of cleansing sewage permanently by recourse to a small area of land where land is very costly. The Rivers Pollution Commissioners show by six analyses taken in the years 1871 and 1872 the following results from the intermittent downward filtration adopted by the author at Merthyr Tydvil. Samples taken June and October, 1871, and July and October, 1872: Organic carbon .156, organic nitrogen .032, ammonia .063, nitrogen as nitrates and nitrites .269; total combined nitrogen .352, previous sewage or animal contamination 2.887, chlorine 2.84. Upon these figures the Commissioners say: “Judged by popular standards, these samples would be pronounced to be fairly good potable waters. They were colourless, transparent when collected, and even when viewed with reference to their chemical composition were considerably superior to the average of Thames water which is habitually used for household purposes in London; indeed there is a close resemblance in chemical composition between the effluent water issuing from the intermittent sewage filters at Merthyr Tydvil and that portion of the London water supply which is drawn from the Thames.” Analyses by Dr. Paul and other chemists confirm these results. Intermittent downward filtration will be found equally valuable whether adopted by itself on a limited area of land for the primary object of purification, or in combination with surface irrigation or an extended area as a means of securing the best return from the utilisation of sewage. The value of the process in the former case cannot be over estimated, as it enables sanitary authorities to purify their sewage up to the standards recommended by the Rivers Pollution Commissioners, by the use of just as much land as they can get, if the quantity be not less than one acre to 1,000 persons, and of gaining some return in the shape of crops at the same time. When adopted in combination with irrigation intermittent downward filtration becomes the “safety valve” of sewage farming, inasmuch as where a certain quantity of land is specially prepared for intermittent filtration the farmer need not take sewage on the irrigated land when he does not want it, or when the cost of application will exceed the benefit to be derived from it. Where a small area of land only can be commanded by gravitation, and a greater breadth can be obtained for irrigation by pumping, the intermittent filtration process may be resorted to on the small plot of lower land with special advantage. In such instances the sewage may be lifted on to the higher land only when there are persons to pay a full rent for both land and sewage, in which case the quantity of sewage to be lifted will be precisely that which the farmer above desires to take, and only when he wants it. It would probably be lifted during the day and on week days, and during the night and on Sunday it would be run into the filtration areas. At times of extreme dilution, too, when the liquid might not be worth the cost of lifting, the filtration areas would receive it, and thus the cost of pumping would be reduced to a minimum. An illustration of the cost of adopting intermittent downward filtration in a case where the land was very costly, and the works of drainage and surface preparation, including carriers, &c., for distribution, expensive too, may serve to show how small will be the rate charged on a district for such a mode of disposal, when calculated upon the population and rateable value of the district contributing the sewage, which is the only proper way of considering the subject. In comparing the cost of intermittent downward filtration with that of any other process, it must not be regarded as an acreage outlay, but as one in which the total expenditure with its profit or loss must be fairly considered in relation to the ratepayers' interests. In the case of a district containing a population of 15,000, with a rateable value amounting to £45,000, and requiring fifteen acres of land to purify the sewage discharged from the district, the cost may reach the following items: Land, £3,000; under drainage, preparation of surface, carriers for distribution, chambers, &c., £2,000; total, £5,000. The charge on the district necessary to repay this sum with interest in fifty years would amount to £225 per annum. The fifteen acres of land, being divided into three equal areas of five acres each, one of which would be sufficient for the daily purification of the sewage while the other two would come into action in rotation, would be de-

voted to gardening purposes. The ten acres, not in daily use, would be let to market gardeners by auction at the highest prices they would give for the land, with as much sewage as they require, and no more. The lowest rent obtainable by this means would be £10 an acre, while the five acres devoted to the purification of the year's sewage would, if let at a rent or retained in the hands of the sanitary authorities, secure a return beyond the cost of attendance of at least £5 an acre. In this way £125 per annum would be realised, leaving a loss of £100 per annum upon the work. This sum of £100 apportioned on a rateable value of the property within the district amounts to less than one halfpenny in the pound. From this it will be seen that with a very limited area of land, and with comparatively costly works, the disposal of sewage by intermittent downward filtration may be attended with a loss unappreciable to the ratepayers, while if it be associated with irrigation under favourable circumstances, that loss may be turned into a profit, with the profit made larger as the area of irrigation is increased. It is to point out the great advantage of associating intermittent downward filtration with wide surface irrigation as a means of securing profit from the latter, as well as to show the small area of land that will suffice for cleansing sewage up to the standards of the Rivers Pollution Commissioners where land is difficult to get, that the present paper has been written.

A FRENCH FLOWER SHOW.—The exhibition of fruit vegetables, and flowers at the Société d'Agriculture et Horticulture, in the Rue de Grenelle, drew numbers of people. There was quite a crowd during the five days it stayed open. Flower fanciers, going there to inspect their favourites, found themselves admiring the productions of the orchard and kitchen garden. Indeed, the flowers were in the minority; and, with the exception of some magnificent double petunias and double begonias (both red and yellow), a fine show of crimson alosias, an exquisite bed of various kinds of violets, some beautiful dahlia and double pink geraniums, they were by no means striking. On the other hand, the apples and pears were magnificent both in quality and quantity. Nearly four hundred varieties of pears, and two hundred different sorts of apples, were set forth in tempting piles on long tables covered with dessert plates. Apples of every shape and every tint; the Alfriston, the Belle Joséphine, the Cadeau du Général, the Roi d'Angleterre, and the Gille de Gille, conspicuous for their enormous size; the Hélotte Dundas, the Calville, the Pomme d'Api, and the Reinette de Hollande Panachée, all exquisite in colour. Gigantic pears, the Belle Augévine and the Belle du Berry, the golden Duchesse de Berry, tapering pears, pears of dumpy growth, winter pears (sometimes ten on one stalk), mellow Beurrés, and delicate-flavoured Cresannes: they were all there in rare perfection. The grapes were not so fine. One exhibitor showed sixty-seven different sorts, but, as there are no less than two hundred cultivated at Thoméry by M. Rose Charmeux, the result was not brilliant, the examples being, as a rule, far below in beauty to what were to be seen on the *échasses* of Thoméry and By a few weeks ago. However there were some good specimens of Chasselas Napoléon, pink and violet Malvoisie and curiously shaped white Doigts de Demoiselle. There were also peaches and quinces, strawberries growing in pots, a few autumn cherries, and an interesting collection of edible berries. Nor did the public disdain the more homely shows of vegetables. One saw fashionably dressed women giving their opinion on potatoes and tomatoes, inspecting mushroom-beds, and transfixed before monster cauliflowers. Carried to such a state of perfection, even the humble cabbage is worthy of remark. Some of the rooms were most artistically arranged, especially one in which several enormous pumpkins, a curious collection of variegated *patirons*, and brilliantly-tinted gourds were shown up by a background of lofty cardoon, celery and leeks, and green banks of parsley and salad.—*The Queen*.

THE PRICE OF WHEAT.

At the Severn Valley Farmers' Club, Mr. R. WOODWARD said: Leaving for the present the question of the relative values of wheat and barley crops, he would endeavour to account for the extraordinary decline they had had in the price of wheat in the last few months. Extracting twelve months' averages from the *London Gazette*, he found the average price of wheat in the cereal year, ending August 31st last, to have been 61s. 3d. per quarter, and that of barley 45s. 3d. He thought they would all agree with him that barley at 45s. 3d. would pay the grower very much better than wheat even at 61s. 3d. But what must they say when they found now that the best samples of barley were worth in the market 48s., and it was with difficulty they could command 44s. for the best wheat. The tables, he should think, were never so completely turned. Such an anomaly as they saw now in the corn market had never before existed in the course of his long life. Taking up corn merchants' circulars they saw wheat quoted at from 40s. to 44s., barley at from 44s. to 48s., old beans as high as 56s., hog peas 48s., oats of the best quality 40s. He did not believe such a disparity could exist six months longer. They had this strange state of things: finest wheat for human food at 1d. per lb., hog peas 1½d., beans for horses 1½d., and oats, which they also gave their horses, 1½d. He could look back to 1815, when the importation of corn was prohibited if the averages were under certain prices. Foreign wheat could not then be imported if the average of the six preceding weeks in England and Wales were under 80s. per quarter; beans, peas, and rye, if the average were under 53s.; barley if it were under 40s.; oats if it were under 27s. This was estimating the value of beans, peas, and rye at two-thirds, barley one-half, and oats one-third that of wheat. In 1828 the sliding scale was adopted, when wheat at 62s. the average was admitted at a duty of 24s. 8d. a quarter; as the price rose the duty fell, and *vice versa*. At that time they were as much frightened at the importation of one million quarters of wheat as they were now at ten millions. The growth of the population necessitated a larger supply of food, and eventually the corn-laws went by the board. It was idle to express regret that they had now no protection. What they had to do was to consider what kind of produce would best remunerate them. He was satisfied they would have to pay more attention to their grass lands, the improvement of which was much needed, and was perfectly feasible. The populous towns were inadequately supplied with milk, and he was convinced the farmers would increase their incomes by giving more attention to their dairies. They commanded 21d. or 22d. a lb. for butter. In 1842 or 1843 fresh butter was sold in the Shropshire markets for 6d. per lb. That amount was also thought a remunerative price for cheese; now 9d. per lb. could be obtained, and 10d. had been given for much English-made cheese this year. The north of England was very much dependent on America for cheese and butter, and from that country were also imported large quantities of pork. If it were more profitable to produce butter and cheese, why did they not do it? He was afraid they were too much attached to the old-fashioned practice of growing wheat. Could they afford to grow it at 40s. a quarter? If they could, let them continue to do it, for he did not think that at from 36s. to 40s. they would have any great importation from abroad. Until the present harvest they had not known the full effects of free trade in corn. He had named the price of 61s. 3d., which did not differ materially from that of the three previous years. But such bad harvests as those of 1871, '72, and '73 were seldom witnessed, and in the year ending August, 1873, they imported 12½ million quarters of wheat and flour. France in 1873 had one of the most miserable crops ever seen, and it was doubted whether England and France could from every part of the world obtain a sufficient supply to last till the late harvest. But it happened they were all deceived, for instead of 12½ millions being required they imported only 11¼ millions. He was puzzled to account for this difference, except it was that last winter was unusually mild, and there was a greater consumption of vegetables and less of bread. He found that the decline in the price of wheat was most rapid on the immediate approach of harvest. The people had made up their mind that

there was to be a most abundant crop of wheat. He would ask practical farmers whether they had the very large crop they anticipated. He was willing to believe the crop was a good one, but he did not agree that it was an exceedingly large one. Mr. Jackson, in *The Times*, sounded the alarm that the price of wheat was too high and must come down, giving people to understand that the crop was 20 per cent. better than the average. Mr. Caird echoed Mr. Jackson's opinion. Later in the season, on August 12th, Mr. Saunderson gave it as his deliberate opinion that the crop was 7 per cent. under the average. Few would endorse this opinion. It was much more probable that the yield was 7 per cent. over the average. An average crop was generally considered to mean 28 bushels to the acre. He put this year's crop at 30 bushels as compared with 23 last year. He calculated the total produce of the country at 14 millions, and allowing one million for seed they had 13 millions to commence the year with. It was pretty well ascertained that for a population of 32 millions they required 22 million quarters of wheat, therefore there was still need of an importation of nine million quarters, or very nearly so, to carry them to the brink of the next harvest. They could not only get nine millions, but—from the reports of abundant crops everywhere—15 millions if they wanted that quantity. The question was at what price imports would cease. Considering the large amounts that had to be paid for freight, landing, &c., the question the merchant had to determine was at what price America in particular would send wheat. Would 40s. a quarter remunerate home-growers? He candidly confessed that during the 21 or 22 years he had been farming at Arley he had never been able to afford wheat at less than from 52s. to 56s. Therefore he recommended them to turn their attention to barley, with which this country could not be overdone, and which they could grow at remunerative prices. The farmers cling with remarkable tenacity to the growth of wheat. He confessed to the same weakness; he loved his wheat crop when he could produce it in such quality as in the present year. But love was often described as blind; he admitted the weakness, but must endeavour to cast it off. Such was the consumption of malt, that the revenue last year amounted to £3,620,000. Was not that an encouragement to produce malting barley? He might fairly congratulate them on the prices of many kinds of produce, the only exception being wheat. He attributed the great decline that took place in the price at harvest time to the necessity many were under of forcing their wheat to market to raise a certain sum. It was patent that they had to send 300 bushels at this time when 200 served last year to raise the same sum. The decline from the beginning of July to the beginning of September was no less than 20s. a quarter. He cleared out his last year's crop as late as 3rd July at 62s. 8d., and he saw at Kidderminster market within nine weeks of that date an equally good sample at 42s. 8d. He regarded the present year as the test of free trade; he meant as to the price at which the American grower would cease to send his wheat. It was possible that if they held their wheat for two or three months the prices might be a little better; he could not hold out any prospect that they would be materially higher. It depended very much on the severity or non-severity of the winter; if during the spring months the imports were kept up in the same ratio they had been of late then good-bye to high prices.

THE SHROPSHIRE AGRICULTURAL SOCIETY.—In pursuance with a requisition signed by nearly 200 of the leading landowners and agriculturists of the county, the High Sheriff convened a public meeting in the Shirehall, Shrewsbury, to take into consideration "The desirability of establishing an agricultural society embracing an area of not less than the whole of Shropshire," when the following resolution was passed: "That a society be formed for the exhibition of live stock and implements, and for the general improvement of agriculture, embracing an area of not less than the whole of Shropshire." An amendment proposing to embrace within the Society's operation the adjoining counties, was not put. A committee was appointed to carry out the object of the meeting.

NIGHT SOIL.

The following paper was read at a meeting of the Connecticut State Board of Agriculture, by Mr. W. H. YEOMANS, of Columbia.

So long as vegetation exists upon the face of the earth, exhaustion of the soil will be a consequence, and this must be provided for either by natural or artificial means. Where the agency of nature alone exists, acting towards the end of exhaustion, she also provides the means of restoration; so that, although the trees of the forest grow and wax exceedingly great, or the herbage of the fields increases in luxuriance, the trees shed their foliage and dead branches, and if left undisturbed the herbage also decays and falls to the earth, and hence the elements of which it has been divested are returned, with perhaps an additional accumulation from the atmosphere. Therefore, if this were a universal law man's ingenuity would not be taxed to devise ways and means of restoring lost fertility; for where crops are taken from the soil and appropriated, so that their elements go in a different direction, so far as the soil is concerned it amounts to *lost fertility*. The subject of manures of all kinds is one that has engaged the attention and serious study of the farmer in all the long ages that have passed; and yet to-day its importance, and the necessity for study and investigation, are no less than at first. The great desire is to know how, by the use of manures, the waste places of our land may be made fertile and luxuriant, capable of benefiting the owner as well as adding more to the general ornamentation of the farm. Of all the various kinds of manure which might, be considered it is the purpose of this communication to present in as brief a manner as possible, *Night-soil; its saving and uses*. There is probably no fertilizing substance that is more universally allowed to go to waste than this, and yet its value is almost incalculable. Undoubtedly one great reason for this enormous waste lies in the fact that where proper absorbents or deodorisers are neglected to be applied, the great unpleasantness of manipulation deters many from any attempts to utilize the same. But the waste is not confined alone to the farmers of the country; it is in the cities, with their immense population, where the waste is most complete and enormous. A writer has said with a great deal of truth, "Manures of inestimable value are carried from the cities by rivers and lost in mid ocean." Guano has ever been looked upon as the great concentration of fertilizing material; and yet night-soil, with all its valuable principles held for man's use, occupies no mean position even in comparison with guano. Jonathan Laurence stated at a meeting of the Vermont Board of Agriculture "that the waste from the kitchen and the contents of the water-closet, if properly composted, would be of greater value than the same amount of many of the commercial fertilizers that are bought at a high figure by our farmers." Professor Hilgard, of the University of Mississippi, in a lecture before the Marshall Company Industrial Association, stated that "all the products of our fields, excepting a portion of the feed crops, ultimately go to serve as food or raiment to man. Hence man's excrement, rags, paper, and bone, must and do contain the ingredients withdrawn from our soils; and were we faithfully to return all these things in the proper form and in the right place, we should need no guano islands to eke out the deficiency in the return made in the offal of crops and manure of cattle." Prof. J. E. W. Johnstone says of it, "Night soil is the most valuable of all the solid animal manures. When dry few other solid manures can be compared with it weight for weight. Dried night soil is equal to thirty times its bulk of horse manure." It is necessary first to establish the value of an article, or else it is the height of folly to expend labour in attempts to save it. Therefore, unless we first establish the value of night-soil as a fertilizer, we should not be prepared to recommend its saving and use. There are hundreds of millions of people who till the soil for a livelihood, and whom we look upon as far beneath us in the scale of progress, enlightenment and civilization. We depend chiefly upon our barn-yards for our fertilizers. Those millions have no cattle and no barn-yards and yet they supply annually sufficient manure to ensure a good

crop. The same resource that they employ is at our command. They use it, and we almost without exception, refuse it. We have no desire to recommend all the practices of the Chinese and Japanese, but it may properly be asked whether we may not learn a valuable lesson from their diligence in saving manures? An important item in their practice is carefully to save every particle of human excrement with which to fertilize their lands. As Professor Hilgard has expressed it: "The Chinese and Japanese save man's excrement to the letter, and their crops seldom fail: their soils seem to be fresh all the time. Why cannot we, with all our boasted enlightenment, do as much? It is said that when visited by friends a failure to leave on the premises either liquid or solid excrement is considered a great slight, and therefore the practice is adhered to with the utmost exactness. This kind of manure is almost their entire dependence; and from this source a greater number of persons are supplied with food from a given area than are fed from a similar extent of surface in any other portion of the globe. In the privy vault is to be found fecal matter derived from flour, eggs, beef, cheese, pork, beans, &c., salted and peppered, and containing all the elements that are calculated to produce highly nutritious food; and since in the case of animals the value of the manure depends largely upon the food consumed, how highly valuable must be human excrement which is derived from such food! The laws of China, it is said, forbid that any human excrement or urine should be thrown away; and reservoirs are placed in every house, in which they are deposited with the greatest care. No other manure is used in their corn-fields. Says Liebig: "If we admit that the liquid and solid excrements of man amount on an average to 547 lbs. in a year, which contain 16.4 lbs. of nitrogen, this is much more than is necessary to add to an acre of land in order to obtain, with the assistance of the nitrogen obtained from the atmosphere, the richest possible crop every year." Think of this, ye men who have families containing six or eight individuals—fertilising in the best possible manner as many acres—when in all probability the same is at present but poorly applied, it employed at all! If the fact be so, is it not a proper subject for consideration? Let each farmer resolve that in the future, so far as lies in his power, he will endeavour properly to save and economically use all the excrement of the family, both solid and fluid; and what wealth will be added to our commonwealth! In an Essay upon Manures, published in the "Iowa Agricultural Report" for 1872, is found this language: "The economic relations of nightsoil is one of the most important questions that demand the attention of the agriculturist; and not until its importance is fully appreciated will the exhausted lands of the East regain their lost fertility, and the steady impoverishment of our western prairies cease." If the saving and use of human excrement is the wonderful alchemy by which the deteriorated soils of New England are to be restored to their original fertility, much gratitude ought to be felt, and expressed too, towards those individuals who by experiment or otherwise have discovered its great value. Waring, in his Book for Young Farmers, remarks, "Nightsoil, or human excrement, is the best manure within reach of the farmer." And so evidence might be accumulated upon that point from every one who has ever carefully husbanded and properly applied this substance as a fertiliser. It has been estimated that the nightsoil of England in the course of a single year is equivalent to 5,000,000 tons of the best guano. Allowing an average of 500 lbs. of solid and liquid excrement to each individual in the United States, and the population to be 40,000,000, we have 10,000,000 tons of this fertilising substance; and allowing guano to be twenty times as valuable as the combined solid and liquid excrements, we should then have fertilising matter equivalent to 500,000 tons of guano; but, the population of the United States being about twice as great as that of England, with the same proportionate estimate as for that country the value of our excrement would be equivalent to 10,000,000 tons of the best guano, even taking our moderate estimate; and we are fully satisfied that by its full return to the soil incalculable advantage would be derived. Having thus established, as we believe, the value of nightsoil, it only

remains to speak of its saving and use. As before intimated, the great waste of this valuable substance is owing partially to its extremely offensive odour when fresh, and partially to a prejudice some have that it affects the quality of whatever is grown upon it. The first of these objections can be readily met and provided for by the exercise of a little care, which is the very thing necessary to retain its full value; for with the offensive odours the volatile portions are escaping, and its strength and value as a fertiliser correspondingly diminishing. All that is necessary to prevent this is to use deodorisers and absorbents, of which there are a great number, all effectual; and if freely used, all unpleasantness is speedily removed, so that the compost, if it may be called such, is as inoffensive as dry earth alone. Probably the earth-closet system is the most perfect that has yet been devised; but it is not absolutely necessary that the earth-closet itself should be used: the application of that principle in the most convenient manner that is effectual is all that is required—*i. e.*, an application of dry earth in such quantities as to fully absorb all the gases of the urine and unpleasant odour is all that is necessary, provided it be so that it is beyond injury from the weather, rains, &c. Therefore, if the privy is to be used, it should be provided with a tight box or trough to receive all droppings and the application of earth, which should be made often—in point of fact, every time the privy is used—and when filled removed to some place of secure deposit, or else immediately applied to the land. Or a vault of sufficient size to hold a year's supply could be constructed of brick and water-cement, and so the removal of the contents be made at one time. It is well known that by exposure large quantities of ammonia are allowed to escape, and its value as a fertiliser greatly diminished. This is more particularly true in the summer months or in warm weather, when decomposition rapidly takes place and the ammonia in larger quantities passes off into the atmosphere than in the winter months. The sulphates are also dissipated as sulphuretted hydrogen, and the process is so rapid that it only requires a few days to be completed; therefore the necessity of providing some efficient means of preventing this escape can be readily seen. With an ordinary family, say of five or six persons, some two or three or perhaps more loads of fertiliser can be made in the course of the year by the use of dry earth, coal ashes, gypsum, and other substances. And, while the value of the contents of the privy vault, with all their losses from constant exposure, have been considered by those who have used them of great value by adopting the use of absorbents the quantity can be largely increased, and still the value of the whole be equal to equal quantities of the pure article subject to exposure. Nash, in his "Progressive Farmer," has said that "nightsoil should be removed to the land every spring. Its value as a fertiliser is greatly increased if mixed with six or eight times its bulk of dried peat or swamp mud. Its value would be still more increased if this could be added every day, and also a little plaster. It is valuable for all kinds of grains and grass lands. In whatever form it is used, it should be spread thinly." Now, as regards its use, it may be applied to any growing crop, but must be used with great care. It is hardly safe to apply it with the same liberality that might be or is usually employed in the distribution of other manures. A use of this manure for some years upon various crops and upon different soils has amply proved that a comparatively small quantity will answer equally as good or a better purpose than large quantities of stable manure. We have used this manure at the rate of about a pint in the hill for corn, and obtained equally as good, and sometimes apparently better, results than from the use of a shovelful of stable or hogyard manure. We have also used the same upon potatoes, placing a still less quantity in the hill, and obtained the best results. During the season just past we desired to test two or three new potatoes which we had obtained, and therefore used this fertiliser on a small scale, by putting not more than half-a-pint of the manure in each hill, and upon land too that had not been previously manured for a long time; and yet the comparative result was better than when a shovelful of hog manure was used upon a field that had been previously heavily manured for two years for corn. Again, a privy vault used by a tenant that had been uncared for and wholly exposed for a year was emptied, and its contents mixed with from five to six times their bulk of fine chipdirt, and the same being thoroughly incorporated immediately applied to a field of corn, at the rate of about a pint of the mixture to each hill, and the corn dropped

directly upon it. The piece was greensward, and had not been ploughed for many years, nor had it been top dressed further than the usual droppings of the cattle as they fed upon it in the fall. The corn where the privy manure was used was equally as good as where a handful of phosphate had been used. Had the chip-dirt been applied regularly as the privy had been used, its value would undoubtedly have been much greater. We have very often used this upon corn in very moderate quantities and long since become fully convinced of its great value. In some cases our application has been moderate—very moderate—and yet good results have followed. In no case has a failure ever attended our use of it. In fact, we consider it one of the best concentrated fertilizers that can be employed. Our practice has been to use what earth, chip-dirt, sods, &c. were at hand, to throw them into the vault, and then when cleaned out mix it with some three or four times its bulk of sand, dirt and refuse, and let it stand a little time, and then incorporate the same as it is thrown into the cart. There is no doubt but that it may be profitably applied as a top-dressing to grass lands, and although we have no remembrance of having tried it in that way, the effect upon a spot of meadow where we completed the composting of a heap and yet scraped up all that was possible, was sufficient to satisfy us that such an application would be the most satisfactory. Where earth closets or similar contrivances are used this might be the most profitable application that could be made—spreading the accumulations whenever it becomes necessary that they should be removed. When this is not desired to be done it would be well to have a proper place constructed, away from all exposure to the weather, where the accumulations may be deposited until required for use. It is no less important that the urine should also be saved, for it is equally as valuable as the solid excrement, although even not as much employed as a fertiliser. The accumulations of the night-chamber are usually thrown at some convenient point where no benefit is derived, and yet a cask could be placed in some out of the way locality in an out-building where all the urine and slops could be deposited, and as occasion required spread upon some field near at hand. All the valuable properties are at once taken up by the growing plant, the same being in the best possible condition for being received by it. Another practice which we have followed to a considerable extent, and one which we would recommend to all is to furnish a quantity of earth and compost material, depositing it under cover, and of easy access where the slops of the house are daily deposited, and absorbed. When the same is sufficiently saturated it can be removed and the operation repeated, being careful to have the same fully prepared before the setting in of winter. Another method is, instead of placing the absorbent in a pile put it in barrels into which the urine is to be poured, and which can be emptied as desired. In this way a large quantity of valuable material can be accumulated. A gentleman who has practised this to some extent remarked in our hearing that in that way, in the course of the year, he could make from fifteen to twenty barrels of fertiliser, and that he would rather have barrel for barrel than superphosphate. Some years since we tried the last-mentioned method by filling at the commencement of winter a barrel with coal dust upon which urine was poured until the same was thoroughly saturated and frozen solid, when it was discontinued. In the spring the preparation was used to plant corn, by putting about one pint in the hill, dropping the corn directly upon it. The result was that hardly a spire of corn made its appearance; it had been as thoroughly killed as it would have been with the same amount of the best guano. The piece was planted over, however, by striking into the hill with a hoe, dropping in the corn and again covering. This time the corn came up, grew vigorously, and maintained throughout the season the darkest and richest colour of any corn we ever saw. This satisfied us as to the great value of urine as a fertiliser. The past season we tried chip-dirt saturated in this manner, side by side with superphosphate, with very nearly equal applications in quantity, and could discover no appreciable difference in the growth of the corn or in the general result; of the two, that where the urine was used, as in the previous case, was of a deeper and richer colour while growing. We have for several years used this material almost wholly in the garden, and sometimes upon vines in the field, and always with success. Now if these substances, as we believe has been proven, do possess such valuable fertilizing properties, and have in the past been generally neglected and allowed to go to waste, is it not high time that an economical use be made of them, and so

the alleged deterioration of our soils not only be arrested but their fertility in a great measure restored? Is not this better than to make the excessive expenditures for manures and

commercial fertilizers which are now made? This is a subject of the greatest importance to the farmer, and should receive his careful consideration.

BOROUGHBRIDGE AGRICULTURAL SOCIETY.

FARM BUILDINGS.

At the annual meeting, Mr. J. D. Dent, Ribstone Hall, in the chair, Mr. Ford read the following paper on the Construction of Farm Buildings.

It will at once be apparent to all connected with the management of land, that there is almost no object of rural economy more worthy of care and consideration than the judicious arrangement of the outbuildings and offices which are necessary to the successful cultivation and management of a farm. There is so much depending on them, that it may be said the farmer's chances of profit or loss will turn upon their adaptability or otherwise to the land he cultivates. And in the present day economy of labour is so important an element of the farmer's success, that unless provision be made for effecting it in the arrangement of buildings, he will find that he runs an unequal race with his brother agriculturists, who have well-arranged buildings constructed with that care and consideration which has been given of late years to the proper construction of the outbuildings of a farm, where convenience of arrangement and economy of labour has been duly borne in mind, and regard has been paid to an effective system of drainage and ventilation, crucial points, coupled with improved accommodation, bearing upon the health and well doing of live stock. There must be many varieties of buildings, suitable, first to the district or country in which they are erected; also to the style or system of farming they are intended to serve, and further to the proportion of arable and grass land they are to accommodate. Dairy farms require their special arrangement, also sheep farms, meat-producing farms, and hay farms; but it will, I think, be sufficient for our present purpose to discuss what are the requirements of a mixed farm of from 300 to 500 acres in extent, in this part of the country, the grass land of which is of fair average quality. The site is, of course, the first consideration, and in choosing it I do not bind myself to place it in the centre of the farm, but rather seek a position that is moderately sheltered, that is dry, where good water can readily be obtained, and with such a natural fall of the ground as will rapidly carry away all surface and roof water to the nearest watercourse or tank, and give an easy fall for the manure drainage of the buildings to a well selected spot for a liquid manure tank at a little distance away. The site should also be selected with special reference to making the most of adjacent converging roads, whether public or farm roads, bearing in mind that a divergence or unnecessary deviation of a few hundred yards, though of little moment for a single journey, magnifies itself into a terrible loss of time and of power when multiplied by all the varied and heavy traffic of a large farm in a twelvemonth or a course of years. And in these railway days there is a point which should not be overlooked when arranging a site for new farm buildings—I refer to the practicability of introducing a siding on to the farm; the nearer the buildings, of course, the better, when it does not interfere with the working arrangements of the fields. Such a convenience is so obvious where large holdings have to be served, that I commend the matter the united interests of railway companies, landlords, and tenant-farmers. Just fancy having your artificial manure, your town manure, your lime and linseed cake, your coals and various other bulky materials, brought (so to speak) to your door, while the corn, stock, wool, &c., would be laden there and then in the trucks and run down to the line. Such a condition of things would surely attain to a farmer's notions of all earthly bliss, and if I may venture to predict, a system somewhat akin to this will in favoured and convenient localities be introduced before we are much older—for besides other considerations as to economy of labour, &c., it will be found that we shall become more dependent upon the manure of towns and large centres of population in order to increase the production of our fields, and such valuable aids as I have spoken of would be more eagerly sought after by farmers were it not for the immense cost of haulage of such

bulky material for any distance. The site then chosen, the material is the next consideration, and I need not say that where stone is readily available, it is always the preferable material, as being most durable, warmer in winter, and cooler in summer. There are large districts, however, where stone cannot be procured except at great cost by railway. In such cases bricks will usually be found in the neighbourhood, and must necessarily be employed. It is but poor economy in the erection of farm buildings by brick to wall too lightly. The main walls, at any rate, should be of substantial thickness; if not, they become mere shells. The walls rock; door frames do not hold; rats get easily under them; in fact, they are cold, unsubstantial, and very undurable. Where boarded floors are laid on the ground floor, such as in barns, &c., I strongly recommend the intervals between the joists being filled in with concrete or some similar and effective substance. It is an effectual stop to rats, which often become so great a plague in buildings. Slates will be found the best roofing material. While on the subject of material I should not omit to call your attention to a recent article in the *Royal Agricultural Society's Journal* on "Concrete as a building material for farm buildings and cottages." This concrete it would appear is composed of various materials, such as gravel, shingle, sand, shells, broken bricks, tiles, and stones, burnt clay, and in fact almost any rubbish run together with lime and cement into frames composed of wood and iron, which when the concrete has set are removed. The writer, Mr. G. Hunt, architect and surveyor to the Society, claims for it great economy, durability, and warmth, and I must say has, as I think, made a good case in its favour. The preliminaries, therefore, of site and material having been decided on, the arrangement of the buildings becomes the next consideration, and in making suggestions for what I believe to be best, it need not be supposed that there is any arbitrary law to be universally followed, for to translate an old Latin proverb, we find that "so many men so many opinions," and again "circumstances alter cases." For a farm, however, of about the size suggested, from ten to fourteen horses will be required, and the cart horse stable should be placed with a south or west aspect—it should open upon a fold yard, with an end door, opening to the outside of the buildings. On all considerations, separate stalls are to be preferred, which should not be less than six feet wide. I think brick or stone mangers and iron hecks are best. There should not be less than eight feet clear from the stand-posts to the back wall of the stable. It is a great mistake to cramp the distance behind the horses. Draught horses are usually watered at a trough near the stable, and it is often not difficult to cause a drain or spring to be conducted so as to flow continually through the trough. Such an arrangement is of great value about farm buildings where the fall of the ground will admit of it, and may be extended to the houses, or at watering places in the fields with a little ingenuity. When cart horses are kept on oats, and you have a granary or corn-store above the stable (though I prefer the stable to be open to the roof), it is a convenient arrangement to have them shot down a spout into the stable, at the end of the spout being a receiving box that can be regulated to hold just the amount of one feed, and which works on the same principle as the shot belt; by this means the horse-keepers are limited to the regulation amount for each feed. I once saw this arrangement well carried out on the farm of a gentleman in Scotland. Where your grass land is of such quality that the cattle can all be summer fed, the best accommodation that can be provided for them in winter is, in my opinion, a good spacious open fold-yard. I do not intend here to go over the well-beaten ground of controversy as to the relative merits of open or covered yards. There is a good deal to be said on both sides, but for wintering cattle that are to be summer grazed, I should myself prefer open yards with abundant shed room on the north east sides. Shed room is not half used in this neighbourhood as in Northumberland and the Lothians; indeed, I may say throughout Scotland, where the sheds are deep and wide, and bricked

up for an opening, and sometimes two openings at either end. And lately, in looking over some new farm buildings in Buckinghamshire, I was struck with the ample shed room that had been provided for the fold yards. There is abundant shelter in such places, and no matter from what quarter the keen wintry wind may blow, the cattle can protect themselves from it, while they also afford cover for a large portion of the manure. In this part of the country the sheds are often not wider than the length of a beast, and being open from end to end afford but partial protection from the weather. Such folds as I have described will probably afford accommodation for from fifteen to twenty beasts each, which, if not more than half the roots are to be drawn off, will, in all likelihood, be found sufficient; but presuming that a proportion—say one-half of your stock, is to be winter fed, a different class of accommodation may be preferable. In that case complete shelter should be provided, either in the shape of covered yards, or by cattle boxes, or by stall feeding; and of these I must give my preference in favour of the box system. A convenient size for a feeding box is about 10 feet square. In practice I have found this size amply sufficient, though many persons, and at one time myself among the number, have thought it rather confined in space. They should be sunk $2\frac{1}{2}$ feet below the level of the floor, and divided with dwarf walls, $2\frac{1}{2}$ feet high, and sparred wooden partitions fixed on the top of the walls. A gangway of sufficient width to allow the passage of a cart should run down the middle with boxes on each side. Feeding troughs are better to slide up and down, so as to go up as the manure rises. My own are of strong Staffordshire ware, and I cannot speak too highly of them for cleanliness and adaptability to the purpose for which they are made. I do not attach much value to affording a supply of water to feeding cattle—for with a full supply of roots I have found they are indifferent to water, in fact do not require it, though I have frequently tried them—for in my own case I have a thorough system for the unlimited supply of water to each box, but the arrangement is of no value, and is never used. Hay or straw stacks are supplied to some, but these I do not value. Such fodder is better, and more economically conveyed to feeding cattle chopped up, and mixed with pulped roots and meal. A line of rails should run down the gangway, on which the feeding truck will travel, and the attendant will economise labour by first filling the truck, and then serving out right and left as he proceeds down the gangway. The boxes will be readily emptied of manure by a cart proceeding down the gangway, in at one end and out at the other. A roomy covered shed is necessary for calves or yearling beasts. It should be contrived near, in fact adjoining the cart-horse stable, from which all the waste litter will be thrown, and converted into manure. Young store cattle freely eat the litter from a stable. It is impregnated with the salts of urine, and is relished by them. Where liquid manure is not absorbed by litter, as in the case of feeding boxes, it should be conveyed away by a proper system of drainage into tanks. The high range of buildings composing the straw-barn and granaries should be placed to the north or north-east for considerations of shelter, on which aspect also the cart and implement sheds should face for the purposes of shade. It is a good arrangement to have the principal granary over the cart-shed. Thus by a trap-door in the floor of the granary much economy of labour is effected in loading carts with grain, &c. They are always loaded dry. It is also very convenient for unloading linseed cake. As it is not so much the object of this paper to enumerate all the different requirements of farm buildings, as to urge on those engaged in or contemplating their erection, due regard to economy of labour and efficiency in construction, I need not dwell upon the various adjuncts of buildings, such as turnip houses, loose boxes, always very useful, a roomy house of a nondescript character, which may be used as a receptacle for artificial manure, pot-toes, as a slaughter-house, or what not. All these conveniences will suggest themselves to the designer of buildings, and should be placed so as to cause the least waste of time in their daily use. Where steam is used as a motive power, I should prefer a portable engine to a fixed one. These can now be obtained available both for thrashing and conveying power through the buildings for the various grinding mills, root pulpers, pumps, &c., as also for cultivating the land. Concluding these remarks, I will venture generally to summarise the purposes and requirements of farm buildings. They may be regarded in three divisions. First,

as affording convenience for thrashing out and preparing for market of the grain crops. Secondly, as a manufactory for animal food; and, thirdly, as a manufactory for manure; therefore, in planning buildings, these objects should never be lost sight of, that they have to be effected with the utmost regard for the economy of labour, that they be efficient in all their parts, that there be no actual waste of time or power involved in their use, and that the purposes of each department be subsidiary to the others. Patchwork buildings, or such as have been made at different times added to or altered are generally the very worst, for hardly anything has been done with regard to the general bearing of one part to another, consequently in such buildings there is waste of time and of fuel. When cattle are fed under cover they feed quickest, and on a less amount of food. The animal temperature is higher, consequently by the laws of physiology less food is required to sustain respiration, while the process of assimilation is quicker, but a pure atmosphere is an essential part of such a system, consequently ventilation must be thoroughly regarded in all stables, cow-houses, cattle sheds, &c., and particularly where feeding animals are housed. Manure made under cover is, I may venture to say, as good again as that made in open yard, especially if the buildings and sheds surrounding the latter are not spouted. Open yards are, however, suitable enough in certain cases, which have before been specified, but, as I have urged, they should have ample shed accommodation. It will be found in the future history of agriculture that, inasmuch as a more commercial and business-like arrangement will exist between landlord and tenant, so farm buildings will have to be so contrived and arranged as that a thorough system of economy and efficiency may be combined. The manufacturer plans his mill with anxious care; and while a recognised system exists for the erection and arrangement of all factories, there are those at work with hand and brain who are ever introducing modifications, improvements, and labour-saving novelties—so in farm buildings there should be no diversity of arrangement, but the various parts should be so fitted and arranged that in their relation one to another there should be no waste, either of time or of tissue. The whole arrangement of farm buildings, as of so many other things, should be summed up in two words,—viz., "Efficiency and Economy."

Mr. SCOTT, the Vice-Chairman, inquired of Mr. Ford what he considered should be the outlay per acre upon farm buildings.

Mr. FORD, in reply, stated that it was generally understood the farm buildings ought to cost from £7 to £8 per acre, and the house from £4 to £5 per acre.

The VICE-CHAIRMAN was of opinion that the accommodation spoken of by Mr. Ford could not be obtained for £7 or £8 per acre when the box system was carried out.

Mr. FORD said that for a 400 acres farm proper farm-buildings would cost £3,200, which was no doubt a large sum.

The VICE-CHAIRMAN remarked that the amount was serious, and he thought that £10 per acre was sufficient, including cost of farm buildings and residence.

Mr. FORD said that farm buildings at a large cost were only put up by proprietors, and sometimes the expense was as much as £20 per acre. Improvement in the arrangement of buildings was required with a view to the saving of time and labour.

Mr. JACOB SMITH thought that at the present day they could do with fewer farm buildings than were formerly required, inasmuch as they could sooner dispose of their corn, and were not obliged to hold or store it. To keep it a long time on hand was not advantageous to farmers, and frequently involved them in pecuniary loss. In erecting farm buildings he should in the first instance put down a good barn, simply for straw, and so build it that he could place his stacks near to it, and have his steam-engine close by for thrashing purposes. He would have no corn barn. For grazing purposes he thought that fold yards with shedding were the most convenient. Instead of making fold yards capable of holding from 25 to 30 beasts, he would divide them into three or four, and place about ten beasts in each. By that plan nearly double the beasts could be accommodated in the same space. A large and well-ventilated cart-horse stable was also indispensable. The price of horses was now very high, and therefore it was the more important to attend to their health by giving them thorough ventilation, a good barn, a good fold-yard, and a good stable.

The CHAIRMAN inquired of Mr. Scott if he could give them any information as to adapting old buildings to the modern requirements of farming.

The VICE-CHAIRMAN, in reply, said that the profits of farming were now so small that they would not allow much outlay upon farm buildings, and that as a rule the proprietor ought to confine his outlay to £10 per acre. Beyond that an expenditure was not profitable or warranted, except in extraordinary cases. His opinion was different to that of Mr. Smith as regarded barns, as he would have no barn at all. He would, however, have a stack shed, and a small space exclusively for the dressing of corn. Broad sheds were much more preferable to those which were narrow and lofty, and a turnip-house he thought quite unnecessary, because when a house was used for that purpose he believed there were more decayed turnips than when they were stored in a pie outside. The cart-horse stable ought to be commodious, and it was important that it should be open up to the roof without any hay-loft or chamber above it. He produced a very compact plan of a farmstead under one roof, and equal to a farm of two hundred acres, two-thirds of it being arable, at the estimated cost of £1,500.

Mr. BENNETT said that he agreed generally with the remarks made by Mr. Ford in his paper, and also with the views of Mr. Smith. He should like to ask Mr. Scott why he objected to a turnip-house, because it was a convenience which farmers required for preventing turnips getting wet and frosted in winter, when they were not so good for the cattle.

The Rev. R. D. OWEN said from what Mr. Smith had stated about a straw-barn it appeared that he attached importance to the straw being placed under cover directly after being thrashed, but from what the Vice-Chairman had observed it seemed to be a matter of indifference whether the straw was placed under cover or not.

The VICE-CHAIRMAN said that he would have a covered shed, but open all round.

The CHAIRMAN again said that he should like to have the views of those present on the adaptation of old farm buildings to the requirements of modern agriculture. There were a lot of farm buildings now in existence which were not of a character suited to the wants of the present day, but they could not afford to pull them down and erect new ones in their place, and therefore what was required was to adapt them, as far as it could be done, to the necessities of the present day. He had been a few days previously in the East Riding, and was struck with the paucity and poverty of the sheds in the fold yards, these sheds being of such a character as he was sure they would not like to build. These sheds belonged to his father, and on looking at the valuation papers he found the buildings described as being well adapted to the farm, a fact showing what great improvements had been effected up to the present day. He agreed with Mr. Smith that it was not wise to have enormous fold yards, but to divide them into convenient sizes, because if they had all the beasts together the weaker animals were sure to be sent to the wall by the stronger, and consequently were prevented from obtaining their proper quantity of food. He thought, too, that they were all agreed about the cart-horse stable, namely, that the old fashion of having the granary or hayloft above was as bad an arrangement as could possibly be. They were all of one opinion as to the desirability of having plenty of room and ventilation. He did not agree with the suggestion of having no turnip-house, as in rainy and dirty weather they would be awkwardly placed without such convenience. The art of farming, more especially modern farming, was in the breeding, to keep their animals going from the time of the birth until they arrived at the point when they were fit for transfer to the butcher. An abundance of warm accommodation was therefore necessary, in order that they might get their calves forward, and keep them constantly progressing, so that at as early a period as possible the butcher could take them. He was opposed to the old system of stacking grain and keeping it for a long time without bringing it into market, fully agreeing with the maxim that "small profits and quick returns" was the best policy. There was one point to which Mr. Ford did not allude, and that was the necessity of having good soft-water tanks, which were very valuable for buildings. The idea of railway sidings running upon farms was no doubt desirable where such a thing was possible, but unfortunately there was not one farm in fifty which had the advantage of being skirted by a line of railway. It was a point whether it would not be a convenience to have outlying

farm buildings. By this means they would so arrange matters that each portion of a farm would obtain its proper share of manure. This was desirable for some farms especially, as it lessened farm labour.

Mr. FORD, in replying to some of the observations made in reference to his paper, said that he was glad to find that they were not at issue on many occasions, and that they had dealt so leniently with him. In feeding beasts Mr. Smith had stated that he preferred covered sheds to boxes, and he would ask him why? His experience taught him that there was no system so admirable as feeding beasts upon the box system, because every beast got his proper share of food, and they were not disturbed or annoyed by other animals. Box manure was also a great assistance to land. When the cattle had had plenty of cake and corn, the effect of the manure could be seen to a yard upon the land to which it was applied. He was surprised to hear Mr. Scott say that he did not see the use of turnip-houses where they could store turnips for a fortnight or more in frosty and bad weather. In his opinion turnip-houses were very useful. Small fold yards were undoubtedly good, and he agreed with Mr. Smith in his respect, and as an example of the right thing he referred to the cattle courts in the Lothians, which would just hold eight beasts each. A soft-water tank was a very great acquisition to a farm.

The CHAIRMAN said that Mr. Montague was building a large number of Dutch barns for his tenants, and stated that the late Mr. Thompson had one at Kirby.

The VICE-CHAIRMAN said that he was a great advocate for Dutch barns, having put up two himself, and he believed that even if built by the tenant they would more than repay the cost. The fair way, however, was for the landlord to find the posts and the tenant to put on the roof. He did not want to be misunderstood as to a turnip-house. He thought that a farmer ought to be ashamed of himself if his turnips were not all stored before Christmas, but at the same time he maintained that turnips could be better stored in pies out of doors than in a building, and when so collected they could be taken direct to the pulping house.

The CHAIRMAN said that he agreed with Mr. Scott that turnips could be better stored inside than outside, but he still thought it was well to have a place to hold two or three days' stock. In this country too little attention was paid to the harvesting of roots. Good roots were grown, but he was often surprised to see excellent swedes not harvested before frosts set in. As to pulping turnips farmers generally had not come to that.

CONTAGIOUS DISEASES (ANIMALS) ACT.—At the Suffolk Quarter Sessions, held at Bury St. Edmunds, Colonel Wilson, chairman of the Contagious Diseases (Animals) Committee, called attention to the enormous expense of carrying out the regulations of the Privy Council, and the following resolution was adopted: "This court begs again to call the attention of the Privy Council to the great expense incurred by the county in consequence of the compulsory slaughter of animals affected with pneumoia, amounting to no less than £219 since the issue of the Order of Council on the 2nd August, 1873; whereas the experiments recently made by Professor Simonds tend to prove that this disease does not extend the area of its existence by any of the ordinary means which cause the spread of infectious diseases. Without going so far as to say that pneumoia is not infectious, this court would suggest that in the present state of doubt on the subject slaughter should be discontinued and perfect isolation insisted upon."

PUBLIC MATTERS AND PRIVATE INTERESTS.—Quoting Mr. Hutchings as to Chambers of Agriculture being of no use to farmers, a correspondent of *The Western Times* says: "I have not been so plain as that, because I did not care to have it thought I had got upon a hobby and was pleased at riding it hard. But I predicted this result as soon as I saw the 'Constitution' of the Central Chamber nine years ago. The force of public opinion caused some formal alteration to be made in this 'Constitution' five years ago: but its worst features—the private interests that were involved in its authorities—remained practically the same. Any pretence in regard to the real object for which the Central Chamber was formed in 1865, when tenant-farmers were in a state of scare about the cattle plague, is, as Mr. Hutchings says, merely 'a delusion and a snare!'"

HEXHAM FARMERS' CLUB.
FARM BUILDINGS.

At the first meeting of the session, the President, Captain Nicholson, in the chair, Mr. J. DAWSON, veterinary surgeon, Corbridge, read the following paper on the construction of farm buildings in reference to the health of stock:

The paper I purpose reading before you to-day is, as announced, "The construction of our farm buildings with a due regard to the health of our domestic animals." Little doubt can exist as to the importance of the subject, especially in these times of enhanced prices of all our domestic animals. The farm onsteads, buildings, and sheds are, in this country, with few exceptions, to my mind quite inadequate for the requirements and maintenance of our stock as regards their health, which is much to be regretted, for although they might be much improved with alterations, such, at the best, would only be patch-work, and therefore incomplete, but nevertheless desirable white modern, well-designed buildings cannot be obtained. The question arises, Why should such alterations and more perfect buildings be constructed? Simply because they do not meet the requirements of keeping stock in a healthy state. These wants I will endeavour to set forth before we consider the plan of constructing the buildings. At the Social Science Congress, held in Glasgow this year, Dr. Playfair reminds us that air is, of all things, the most familiar to us, and the one most forced on our observation. He says to breathe is our first act of life, to be unable to respire in the last act, which is followed by death. We all know the fact; the reason I quote it is the plain and graphic way it is mentioned. It is the same in domestic animals as in man, and to have that air in the most pure form is undoubtedly the most important part of our present subject. Years ago our army horses, from improper housing and want of pure air, were destroyed by hundreds every year, owing to the baneful disease called glanders, and suffered much otherwise in the respiratory organs and diseases of the eyes. Professional and eminent veterinary surgeons stated that the mortality amongst the horses of the French cavalry prior to the year 1836 amounted from 180 to 197 per thousand per annum, whereas during the succeeding years, after the stables had been enlarged, and the rations of air consequently increased, the death rate fell to sixty-eight per thousand, and in some instances where the ventilation was further increased, the diminution in the mortality was still greater. Mr. Wilkinson, principal veterinary surgeon to Her Majesty's forces, states that the number of deaths among the English cavalry horses, which was formerly considerable, is now diminished by superior accommodations to twenty per thousand per annum, and of this half arises from accidents and incurable diseases. The same authority states that under the improved system glanders and farcy have almost entirely disappeared. To the testimony of these gentlemen we may add that of M. Moulin, who informs us that during the Italian war 10,000 horses were kept in buildings externally open to the air instead of enclosed stables, and that scarcely any horses were sick, also that there occurred only one case of glanders; and, quoting from the editor of *The North British Advertiser*, "Now, it must be borne in mind, that the absence of vigour observed in animals dwelling in stables insufficiently supplied with fresh air, as well as disease arising from imperfect ventilation, are only in part due to the imperfect provision usually made for the escape of the narcotic carbonic acid and other products of respiration. Probably the chief mischief arises in badly arranged stables from the irritating ammonia yielded by decomposing urine, and the still more noxious, and at present less tangible, products of the putrefaction of faecal and other organic matters." The above information given by these eminent veterinary surgeons we cannot dispute, as it is founded upon facts, as the statistics of the death rate in the different countries since the improvement took place, which are plainly set forth for our guidance and practice. In my humble experience in different parts of England and abroad, I can fully endorse the facts supplied by those gentlemen whom I have just quoted, and more especially M. Moulin's, for in the midland counties of England the work or draught horses are for the most part of the year kept in an open yard, and are singularly free from respiratory diseases. When they do occur,

the animals are more amenable to treatment than others that are confined in that part of England. However, in our northern counties, we require to have our domestic animals housed for a considerable portion of the year, and that, I urge, ought to be done with the greatest regard to health. Owing to the altered and artificial state in which we feel ourselves bound to have them placed, the changes in temperature, which very frequently occur at all seasons of the year, ought to guide us as much as possible with regard to the amount of ventilation requisite. It is scarcely necessary for me to observe that in summer, when the thermometer is ranging from 70 to 100 degrees Fahrenheit, the ventilation cannot be supplied in excess, if it does not in its ingress from excessive motion cause a draught upon the animal, which drawback can easily be avoided by a proper adjustment of the ventilating process. When the atmosphere surrounding indicates to us heat in excess, we then know that our animals housed require a much larger volume of air, owing to its rarity caused by that heat in excess, and it is well known to everyone that heat much heightened means chemical action much increased. At the same time the chemistry of nature is at all times active at ordinary temperature, and heat being the chief chemical agent increases that action, just in proportion to its increase of temperature and the products of respiration, the urine and faecal matters being highly charged with nitrogenous substances, or in other words, with materials which have a great affinity to combine with the oxygen of the air, and when that combination is complete the newly-formed product is an offensive gas, which is inhaled or taken into the lungs of the animals confined within that building if a provision is not before made for the egress or outlet of that noxious gas. Noxious it is because it carbonises or poisons the blood more or less according to its density and confinement, and the length of time the animals are subject to such a dangerous influence. I have myself seen many deaths occur in horses from narcotised lungs, or whose blood has been under the action of those gases in extremes and for a long period of time. When it does not produce death it produces debility, varying in degree, and regulated by circumstances too numerous to mention. If such are facts you will, I conceive, very readily coincide with my views on the great importance of ventilation, which has by most of us been too much neglected. We may neglect it, but we cannot ignore the facts which such neglect produces and entails. It is a fact which ordinary or elementary chemistry enables us to comprehend and avoid, for, without fear of contradiction, if we with our vision could perceive the changes that are taking place in the atmosphere surrounding us in confinement or where ventilation is not complete—if we could give colour to the air to illustrate those injurious changes which take place in buildings overcrowded, it would rivet the importance of the subject more firmly upon our minds. In the treatment of many diseases of our domestic animals the surface of the body is and ought to be protected from the chilling effect of air surrounding; that can be done with proper clothing, and, if needs be, with heat supplied artificially, and even then a current of fresh air is necessary. From many years' experience and observation I am led to the conclusion that many of the diseases that periodically prevail in stock with variable severity, heightened or lessened by the vicissitudes of a changeable climate, are, to a very great extent, spontaneously induced, and beyond a doubt aggravated by a deplorable want of proper house accommodation. The condition of horses and cattle in towns ought to have our special consideration, owing to their concentrated condition, and the teeming mass of animal life immediately surrounding, and the myriads of obstructions to a free flow of pure air. There are other necessities essentially co-existing which ought to be and can be well supplied in properly built stables and cowsheds—viz., an ample amount of transmitted light, a subdued reflected light, a plentiful supply of pure water, without which no animals can be kept in health; it enters largely into the composition of the blood and carries the more solid and potential nutritious substances into that living stream, indeed it forms by far the

largest portion of the assimilated product of nutrition; therefore to have water of a proper kind fresh and plentifully supplied not only for food purposes but for cleanliness as well. I desire you particularly to bear in mind that no ventilation or disinfection can be successfully carried out in any building or cattle-shed of any kind where a due regard to cleanliness is not observed. Trusting that I have in the remarks before mentioned humbly endeavoured to set forth and point out a great necessity for an improved and better construction of stables, cattle-sheds, &c., I will now try to show how that can be, or at least ought to be brought about. In the first place, stables and other houses for cattle ought to be near to the farmer's dwelling, so that the farmer and his attendants can have short and easy access to attend to the requirements of the different kinds of stock kept upon the place. The most eligible site ought to be chosen for the building—that is, the soundest space obtainable ought to be secured, having always in view the necessity to have an ample space of ground as well, for the deposits which are required outside. That fixed upon and secured, the front of the building should have a southern aspect. Then in the first place sufficiently drain the ground with common tiles pretty deep, to allow room for a suak foundation. Then suppose the farm-building to be 36 yards in length by 10 yards broad, forming the figure of a parallelogram, with an addition behind as shown in the pencilled rough ground-plan of a hay and straw store, in front of these store chambers a corridor or feeding-passage should be carried along the whole length of the inside walls. Then on referring to the plan you will observe small doors or openings into the stalls about $2\frac{1}{2}$ feet square, 3 feet up from the floor-level, so that the food can be put into the rack and manger without going into the box or stall at all. The water should be conveyed in an iron pipe under the feeding-passage the whole length of the building, with small branches off coming into the receptacle for the water, which is placed on a level with the rack and manger, with a small tap to turn on or off as required, and with a plug at the most depending part of the water-pan to let off and clean the pan for a fresh supply. You will also observe doors leading from the feeding passage into the stable. In the stable or interior of the building you will observe harness-room, loose boxes and stalls: loose boxes about 10 feet square, and stalls about 9 feet long by 6 wide. At the front you will observe a sufficiency of doors and windows. The ground floor at the base of the entire building to be well cemented, with suitable channels on the surface of the floor leading from the stalls into a main channel behind; all of which to be well guarded with inlaced iron grating. The large or main channel to convey the urine and water which is used to cleanse the stable through the wall, as you can see by the plan, into a suitable receptacle outside the building. It is a very common practice to have sewers or drains and other receptacles inside the stable with a view to convey the liquids below the surface a considerable distance outside, which plan I do not consider to be good. On the same sheet is given as you will perceive, a rough plan of the elevation of stables, &c., showing louvre boarding and pillars placed equi-distant from each other, supporting a suitable sealed roof, well fixed upon the side-wall stone-work, with openings through the ceilings into the small interspace, then through the roof, guarded by a ducklet shaped louvre-boarded exit. The side-wall stone-work to be at least 10 feet from the floor to the pillars supporting the ceiled roof; the stone pillars at proper distances, about 1 foot 6 inches high, the louvre boards filling up the interspaces all round about the eaves of the side-wall stone-work; the louvre-boarding at the eaves to be opened or shut by a jointed iron cranked handle to fasten upon pivots, extending from a longitudinal bar, extending from pillar to pillar on all sides of the building. These boards I consider to be the very best mode of ventilating farm stables and other out-buildings; they act much on the principle of Venetian blinds, and can be, by easy manipulation, well opened or partly opened, or if necessary, closed *in toto*, sufficiently to meet the requirements of stormy tempests, which occasionally blow from all the four quarters. The gases formed in stables rise from the ground-floor to the highest part of the interior, and through the boards the foul air has ample room to flow into the atmosphere outside, admitting at the same time equivalents of fresh air, which circulate throughout the whole of the interior, again to be rejected and replenished *ad libitum*; then again the boards forming the eucats on the roof aid and

operate on the same principle in summer time. End doors and openings from the feeding passage can be opened if requisite, but it would be rarely necessary to do so with well arranged boards. Some of the windows could if wanted be opened occasionally, which would readily supply a sufficiency of air pure as nature sends it forth from without. The height of side walls at present existing in very many stables is very much too low; no proper ventilation can in them be carried out. Severe draughts are numerous enough in most of them; others have scarcely any excepting in parts which require repair. Air in excessive motion coming in direct contact with the stock is not desirable but injurious, therefore we require to have high side-walls and ample louvre-boarding in order to subdue the currents previous to coming in contact with the stock below. Currents, of course, we require, but not to have our stock tied to the stake and submit to the blast of a north-east wind for an indefinite period. Air admitted in a high building at the eaves blends mildly with air below, and therefore comes in contact with animals on the ground-floor in an agreeable way; consequently I submit to you that until our farm buildings are heightened, until our hay and straw lofts have become merely recollections of the past, and convenient modern structures made in the place of them, we can have no complete ventilation, but must make shift in the primitive style, although limited improvements might be accomplished. Droppings from the floors might, with great benefit, be more frequently removed to a suitable deposit; a spare scattering of disinfecting powder would grace the floors. McDougall's, for instance, is well-known to be most agreeable, useful, and effective in every way; it is moreover to be obtained at a very small cost. During the time of plagues or epizootics of any kind disinfectants are indispensable; they go hand-in-hand with the great scavengers of nature; they seize hold of, arrest, and destroy the germs of disease; they modify and render neutral floating materials which do otherwise injure or destroy animal life, caused by what we term infection. They also effect the same most desirable object with substances which we can more easily recognise—viz., the animal poisons in a visible and more solid form, which come in direct contact with the body, which is termed contagion. Now if we can, as set forth, seize, destroy, and cause to be neutral the most subtle and destructive animal poisons, by having our farm onsteads brought under a great sanitary reform, which I maintain can be done in these days, and especially in the northern counties of England where so many landlords possess large stores of wealth, and are desirous materially to assist laudable agricultural pursuits, I think you will on that ground think as I do—viz., that it will be a great step in a good direction, and a boon devoutly to be wished, when we have seen accomplished a great revolution and stride in advance in the construction of our dwellings for the lower animals. In the foregoing remarks I have endeavoured to point out in a brief manner apparent deficiencies in farm buildings, have given a rough plan in which is a principle shown which I consider to be an improvement, and can be modified and altered according to existing requirements. Such are my views on the subject, and I most respectfully beg to be favoured with yours, as we can achieve more in a discussion on the subject than we can in the mere reading of a paper, thanking you all most cordially for the very patient hearing you have been pleased to give me.

Mr. G. C. GREY had very little to say except to corroborate by experience what had been stated in the paper. He knew perfectly well, whether amongst the lower animals or human beings, they could not have too much fresh air, and, as Mr. Dawson had properly said, they wanted that fresh air similar to what they got it outside, and that without bringing the animal into violent contact with a current of air. Many people let no air into their houses, because they were afraid of draughts; sometimes they opened their windows a few inches only, just a little to let the impure air out. His house, as they knew, stood on the edge of a steep bank, where it was generally blowing a gale, yet he opened his windows and doors wide, but he did not call that a draught, and he did not get any cold from it. He wrote with his windows open, and he had to have a lot of weights to keep his papers down. If they sat with their window only two or three inches open, the result would be they would get cold or a stiff neck. Animals also were apt to take cold when they were pampered with having too little ventilation. They should so arrange their ventilation, as had been pointed out, as to have it well up

above, to have plenty of it in all directions, so as to have an abundance of fresh air, just the same as outside to the animals, and they would not get cold, as the animal's skin or coat of hair, particularly among cattle, would assimilate itself to the air, and so adapt itself to the season of the year. To leave them outside they did not fatten so well, as much food was lost in providing heating material for the animal itself. In houses often cattle sweat a great deal, and they thus lost substance, and did not fatten so fast, but if they kept the houses thoroughly ventilated the animal's coat would get adapted to the season of the year, and animals thrive better when not exposed to drenching showers of rain and to cold, biting frosts, particularly in the early hours of the morning. That was the advantage of housing, but he saw a great disadvantage in housing in keeping animals of any kind too warm. He thought he need not enter into the scientific part of the subject; that had already been sufficiently gone into by Mr. Dawson. For either animals or grown-up people the greater amount of fresh air they got into their houses the better. It many of them would sleep with their doors and windows open they would be healthier and stronger, and they would enjoy better health. He had gone into cottages and heard the people complain about the windows not fitting close, and about a draught coming in at the door, and he had seen the crevices of the window pasted up and sand-bags laid at the door, so as to exclude all air, as the old woman told him "it was done for fear of the barns catching cold." He told her to put her children to bed, and then open the doors and windows, and try that during the next winter, and they would never catch cold. Unfortunately he was supposed to be prejudiced, and these people imagined because he lived in a more comfortable house he preached what he did not practise. He slept all night with the windows of his room open, and the windows of most of the sleeping rooms over which he had any control were open during the night.

The CHAIRMAN said that the very least they could do was to pass a vote of thanks to Mr. Dawson for his very excellent paper. It was excellent in two senses—it was very lucidly and very plainly expressed, at it was interesting in its matter. He did not think that any subject discussed by this Club was really of more benefit than this one, because whatever the nature of a farm a man had under his care he must necessarily have buildings. He must have buildings, and if badly constructed he will necessarily suffer. As it had been clearly shown in the paper, the first object in view was to put up buildings capable of giving protection against the effects of climate—to exclude cold and rain. That was the first object in view, and were it not for that, as Mr. Grey had pointed out, animals might be better left outside altogether. It was a very simple matter to attain the end so far as protection was concerned against cold and wet, but it was not easy to apply this so as to secure those conditions which were necessary to the maintenance of health. It was only by carrying out such suggestions as those made by Mr. Dawson which would enable a practical man to have good useful building on his farm. It would take up too much time to enter into the matter of the operation of those foods which are intended to be burnt in the process of respiration. In fact, what went on in the body of the animal was strictly analogous to what they saw happening in the fire which was before them. The important thing here to be remembered was that the fattening which they were so anxious to accomplish in animals intended for sale was neither more nor less than the storing of fuel in the system for future use. The buildings, therefore, which had more immediate reference to animals undergoing this process of fattening, must be warm and comfortable. There must at the same time be a proper admission of air, not by making a hole through which it would blow upon the animal, but in such a way that it would fall nicely and gently upon it. This could be done by putting in perforated zinc, or some other appliance by which the current of air would be divided as it entered. Having got the fresh air in they must take care to get that out which was really and truly deteriorated. In the process of breathing oxygen was abstracted from the air; but in doing that the animal sent off something similar to the smoke which was going from the fire. If the air so used, as Mr. Dawson remarked, were coloured in a like way it would be much better as they would see and know its condition. The carbonic acid gas that was given off was deleterious to the animal, and they must have a place for its escape. They must admit the air

at the lower part—the air being heavier when cold, and allow the vitiated air to escape at the upper openings. That was unquestionably the correct principle. In conclusion, the chairman proposed a vote of thanks to Mr. Dawson for his excellent paper, to which he was sure they had listened with great pleasure.

Mr. GREY was much inclined to agree with Mr. Dawson that in this age when there was such a great rage for sanitary drainage they had carried the system of fine drainage too far. He considered that an open channel was much safer than a close drain. An open channel in a stable could be swept out, and with the use of a little disinfectant kept clean and sweet. If the sewerage drains were underground and were not properly trapped—and trapping was a difficult thing—they might calculate on an accumulation of gases in that drain of a most injurious character, and which by some action of the wind might be driven up into the stable or byre or wherever it might be. He remembered seeing a stable in the Midland Counties, with a ground like a cattle box, and the old gentleman to whom it belonged took him into it, and remarked to him that it was well ventilated and a sweet stable. It was the forenoon and the horses were out working; it was, indeed, sweet, and he began feeling under his feet. He said "Where's the pavement?" The old gentleman called to one of his men to bring a fork, and he dug a hole, perhaps 18 or 20 inches deep, when it steamed up and filled the place with steam. He remarked that it was cleaned out once in four or five weeks, that disinfectants were used, and when the horse came in it was sweet and clean. A little fresh straw was used each time, and he could not wish to have a stable kept cleaner or sweeter. The owner told him that he was never troubled with his horses. In the Midland Counties they had great rough-heeled horses, and yet he told him he had never anything bad or wrong with their heels, their eyes, or their lungs—that they were perfectly healthy. The ammonia was confined; they did not smell it until it was stirred up. He took a farm, and he had a stable on it at the corner of the buildings; the door was from the interior, and it had two windows. He was told that one or two horses had gone blind that had been kept in it, and that it would be necessary to build a new stable or he would never be able to keep his horses healthy. He went into the stable next morning after it had been swept and cleaned out, and it made his eyes water. There was no ventilation, and he had at once three great holes made in the walls until the mason could come and make them properly. Although the horses regularly went blind in this stable, yet after he broke these holes in it none of the horses which he put in it ever ailed anything.

The CHAIRMAN thought there was a necessity for having more light in stables. What Mr. Grey had referred to was easily understood. Ammonia was an alkali, and might be fixed by means of an acid. The air of many stables was literally loaded with ammonia, but a little acid of some kind put into a pail of water and thrown on the floor would fix it. These acids they must bear in mind were very destructive, but a few drops put into a pail of water could be used with perfect safety.

The vote of thanks was carried unanimously, and acknowledged by Mr. Dawson.

DEATH OF MR. N. G. BARTHROPP.—The death is announced of this well-known agriculturist on November 11th, at Great Yarmouth, aged 60. Mr. Barthropp had retired for some years from his farm at Cretingham Rookery, in Suffolk, where he was especially famous for his breed of Suffolk horses, including such Royal prize-winners as Newcastle Captain, Cretingham Hero, and Man of Kent. Of late years he was more seen about as a judge, and at Bedford, as it struck us, he looked very weary towards the end of a long, hard day's work amongst the cart-horses. Mr. Barthropp had for many years been a member of the Council of the Royal Agricultural Society, as at one time on the Committee of the London Farmers' Club, and of course always a leading man on the direction of the Suffolk Agricultural Association. A kind-hearted, genial gentleman, there are none who really knew him but will sincerely mourn the loss of "Nat Barthropp"—as they called him about home.

THE SCOTTISH AND ENGLISH CHAMBERS OF AGRICULTURE.

On Tuesday, November 3rd, there was a meeting of the English Chamber of Agriculture in London, and on Tuesday, November 10th, there was a meeting of the Scottish Chamber of Agriculture in Edinburgh; as it may be not altogether unprofitable to compare the action and position of these two societies. A landlord is about to retire from presidency of the English Chamber, to be succeeded in turn by a nobleman: a practical farmer has just delivered his retiring address from the chair of the Scottish Chamber, which is now filled by another recognised agriculturist. At the last general meeting of the English Chamber an auditor reported that an examination of the accounts showed that the Chamber could pay something over ten shillings in the pound: at the last general meeting of the Scottish Chamber the treasurer's statement showed that the Chamber had a surplus of available property. The office of the English Chamber is a letter-box stowed away in a corner of an hotel, and its meetings are held in a room hired by the day: the Scottish Chamber has a Chamber, and its meetings are held in its own Hall. The English Chamber has commonly discursive discussions, ending in irresolute resolutions: the Scottish Chamber appears to conduct its business with method, as its resolutions pretty generally speak to the point.

And here, as we take it, is the main difference between the principles and progress of the two societies: the one is an independent body, and the other is not. In every way the better one acts for itself, as the other courts an unwholesome patronage. But we draw this comparison with a purpose. The leading agricultural question in England just at present is Tenant-Right, and at an early meeting of the Council the English Chamber promises to "consider the reports and summary schedules on agricultural customs presented by the Committee on Unexhausted Improvements, and the proposals of that Committee towards legislation." The Tenant-Right cry is of later growth in Scotland, but nevertheless we shall venture to offer as something of an example to the English Chamber what was said and done the other day on this subject in Edinburgh. The chairman of the Scottish Chamber went directly for legislation: "As to compensation for tenants' improvements, the law as it now stands gives him no right to compensation. The improvements created by a tenant's skill, capital, and industry are in substance and in practice, though not in law, the property of the tenant who makes them," and so forth. And the Scottish Chamber, on the motion of Mr. George Hope, "approves of the principles expressed by the chairman in relation to compensation for unexhausted improvements." The whole debate, in fact, as sustained by Mr. Hope and others, is full of good bold argument clearly put; while the local committees recommend that the Chamber should have the laws altered so as to give "complete security to capital invested by tenant-farmers"—That "there is a growing dissatisfaction amongst farmers as to the operation of the land-tenancy laws, more especially to the want of provision being made whereby compensation should be given for all permanent improvements and unexhausted manures"—That "this meeting (Kincairdineshire) urge the Chamber, while steadily using all efforts to obtain the repeal of the law of hypothec and such modifications of the Game-laws as may be obtainable, to concentrate its chief efforts upon obtaining from Parliament a measure to legalise Tenant-Right." We will say nothing here as to the abolition of English Hypothec, from which of course

we suffer in a certain degree, or as to any necessity for modifying the Game-laws on this side of the Border; but rather confine ourselves to the question before us. Will the Central Chamber of Agriculture concentrate its chief efforts upon obtaining from Parliament a measure to legalise Tenant-Right? Will it at the February meeting encourage its members to speak out as they did in Edinburgh? and will it bring forward resolutions such as those which we have quoted? If it can, and if the ship is to swim, the sooner the summary schedules and customs' reports are thrown overboard the better. They are little better than lumber.

Even in Scotland where the subject is not so familiar as in England, these fiddling summaries and district reports are dispensed with, and the Chambers go directly for the principle. A difficulty, however, with our northern brethren is that they are apt to speak only of Tenant-Right in connection with a lease, whereas with us the application is made more to shorter terms, as in Lincolnshire, the example district, there are no leases where the principle prevails. A case in Scotland has served to give more especial point to this view: a tenant towards the close of a long lease was made to believe that he would go on again, and accordingly continued to farm highly up to the very close of his term; when he and his landlord could not agree as to the amount of rent to be paid for the future, and the occupier had to leave the farm and his unexhausted improvements without any consideration for them. Now it is very manifest here that until Tenant-Right becomes law no man must rest content with any "make-believe" as to his remaining in possession. Where the land has been well farmed the tenant at the end of twenty years or so will naturally expect a rise in his rent, as it must be his duty to himself and his family to ascertain precisely what this will be before he determines on his course of action for the last few years. A man in such a position has some opportunity of getting his own again, whereas the yearly holder has little or none. In fact, in the case referred to the tenant was prepared to give more, but not so much as was eventually demanded, and he found, when too late, that he relied too much on that "mutually good understanding," which implies so much and means so little. From the days since *The Times's* Commissioners travelled the country a very common answer to any claim for a generally recognised Tenant-Right was the citation of the Scotch lease, while we have always maintained that principle was required alike for a lease and a yearly agreement. Still, under the longer term the tenant should be able in a measure to take care of himself, as his "notice" follows on no mere whim or misunderstanding, but he knows for years previously what is coming, and against this it is his business to provide. And of this some of the factors in Scotland are making the most, as a meeting held at Inverness during last week will serve to show.

THE CENTRAL CHAMBER OF AGRICULTURE.

A Council meeting was held on Tuesday, November 3, at the Salisbury Hotel; the chairman for the year, Mr. G. F. Muntz, presiding.

The preliminary business included the election of Mr. J. K. Fowler and Mr. J. S. Gardiner, to supply the vacancies in the Council arising from the death of Mr. Webb and the resignation of Mr. Hodsoll.

Mr. A. FELL, M.P., presented the Report of the Local Taxation Committee, which was taken as read, being as follows:

Since the Committee presented their last Annual Report, the General Election, to which they then alluded as imminent, has taken place, and to the question of Local Taxation prominence was universally accorded by candidates and constituencies throughout the kingdom. Mr. Gladstone himself, in his address announcing the dissolution of Parliament, declared the relief of the ratepayer from exceptional burdens to be the foremost item of his future financial policy, admitting that the time had come at length when "A further portion of these charges, hitherto borne by real and immovable property should, with judicious accompanying arrangements be placed upon property generally." With the new Parliament came a new Ministry. The Committee then thought it right to organise, without delay, a deputation from the Central and Associated Chambers of Agriculture, in order to bring the grievance which they had so long complained of under the notice of the Prime Minister. This deputation was received by Mr. Disraeli on the 23rd of March last. It strongly urged that the pressing questions of Local Taxation and Local Government should receive the earliest attention of the new Cabinet, and especially that effect should, as soon as possible, be given to the resolution of the late Parliament as to the relief of ratepayers from peculiarly Imperial charges. The reply given by the Premier was unmistakable. He unhesitatingly expressed his concurrence in the views advocated by the Committee, and emphatically declared that "a system of raising taxation for general purposes from one particular kind of property involves as great a violation of justice as can well be conceived." He recalled to mind his own previous efforts to effect reform of the present system, and reminding those present of the active support which their cause had already received from nearly every member of the new Government, he assured them that, short as was the time allowed for maturing comprehensive measures, their grievance would at once be anxiously considered in reviewing the financial position of the country. The Chancellor of the Exchequer subsequently redeemed the promises thus made, by according to Local Taxation Reform the chief place in his financial proposals, declaring it to be in the opinion of her Majesty's Government "upon the whole, the subject of the highest national interest at the present time." He proceeded formally to acknowledge the truth of these distinct grievances complained of by the ratepayers and persistently urged by the Committee. These were—the employment of local rates in discharging Imperial duties, the exemption of many classes of property from burdens borne for the benefit of all kinds of property, and the faulty systems of local administration now existing. Admitting the impracticability of offering on that occasion a comprehensive scheme of redress, Sir Stafford Northcote gave an assurance for the immediate future of a wide and general treatment of a question which, more than any other, now demanded a thorough solution. He, meantime, announced that some relief would at once be granted in the direction contemplated by the resolution of Sir Massey Lopes, and proposed to apply a portion of the surplus in alleviation of the charges on ratepayers for lunatics and police. The concessions made, although not affording complete redress, will yet be received with satisfaction as a step in the right direction, important alike as regards the principle involved and the progress in Local Taxation Reform. The annual amount surrendered on this occasion by the Imperial Revenue does not, it will be remembered, reach the total of over £2,000,000, which the late Parliament, in assenting to Sir Massey Lopes' resolution, appeared fully prepared even then to sanction. While the increased taxation which the intervening period has brought on ratepayers must now, of course, be held to have still further enhanced their claims for relief. The Committee are, however, willing to await the promised development of the principles adopted by the Government in the belief that next session will afford an opportunity for the necessary reconstructive legislation. But they are naturally gratified to find that the steps already taken are universally approved of. The capitation grant of four shillings per week towards the maintenance of pauper lunatics, and the doubled subvention towards the cost of the police, are both remedial measures of which every ratepayer will feel the benefit; while all possibility of extravagance in administration is avoided by the form in which relief is granted, and by the stringent control of the central authority. The impartiality with which, as the Committee have invariably asserted, town and country will alike benefit by relief thus given has been conspicuously demonstrated on this occasion; and the knowledge that each class of ratepayer will be relieved precisely in proportion to the relative pressure of his national burdens cannot but help forward the cause of reform. During the past session the fruit of the steady resistance offered by the committee to rate-imposing measures was apparent in the limited introduction of bills proposing to increase local burdens. Five measures only affecting ratepayers demanded the opposition of the com-

mittee, viz.: (1) The Elementary Education (Compulsory Attendance) Bill (*defeated*). (2) The Prison Ministers Bill (*dropped*). (3) The Municipal Boroughs Auditors and Assessors Bill (*dropped*). (4) The Municipal Corporation Disposition of Penalties (*withdrawn*). (5) The Registration of Births and Deaths (*objection removed*). The Elementary Education (Compulsory Attendance) Bill involved a great extension of the charges imposed upon ratepayers by the Education Act of 1870, in proposing to make everywhere compulsory the formation of School Boards. New liabilities on account of national education have always been resisted by the committee, who wish to draw attention to the severity of the pressure already entailed by School Boards, especially in rural districts, as shown by recent official returns. Resistance was therefore offered to the present measure, and the committee are glad to be able to report its emphatic rejection by a majority of 320 to 156, or more than two to one. The Prison Ministers Bill reproduced the proposal to enable the Home Secretary to appoint in certain cases, even in opposition to the opinion of the local prison authority, a rate-paid prison official. Notice of opposition was at once given to this bill, its progress was arrested and ultimately dropped without obtaining a second reading. The Municipal Boroughs (Auditors and Assessors) Bill, relating to the election of Borough Auditors, was opposed by the committee as calculated to lessen the interest properly attaching to the duties of their office. The second reading of this bill afforded an opportunity for raising the question of the insufficiency of the system of audit now existing. On the motion of the chairman a Select Committee of the House of Commons was appointed to investigate the anomalies and inconveniences pointed out in the debate. The evidence given before the Select Committee disclosed serious defects in the present system, and will be the means of attracting attention to the want of a really effective audit. The bill itself was dropped before the close of the session. The Municipal Corporation (Disposition of Penalties) Bill proposed to enable Boroughs having no quarter sessions, but possessing magistrates and police, to apply to their own uses penalties there levied. The practical effect of this change being prejudicial to county ratepayers, who would thus have to keep Borough prisoners without the aid of Borough fines, it was objected to by the Committee. In order to meet any existing difficulty and at the same time to protect county ratepayers from this hardship, amendments were proposed making boroughs diverting their fines to their own purposes liable to contribute otherwise to the maintenance of their prisoners in county goals. This proposal not being, however, accepted by the promoters of the bill, the measure was itself withdrawn. The Registration of Births and Deaths Bill, introduced by the government, aimed at the improvement of the present system by increasing the stringency of the existing law. The measure contained, however, a proposal to increase to a small extent the payments now made to registrars out of the local rates. On this point it necessarily encountered the opposition of the Committee. In consequence of the objection thus raised, the President of the Local Government Board undertook to avoid the threatened increase in the rate-borne costs of registration by providing from the Exchequer the increased payments required. The resistance offered by the Committee was therefore relinquished, although the proposal afforded their Chairman an opportunity of calling the attention of Parliament to the anomaly involved in continuing as a charge on local rates any portion whatever of an outlay essentially national, and regulated in amount by central authority. Besides measures necessitating opposition, the attention of the Committee was directed during the past session to three other bills, viz.: (1) The Sanitary Laws Amendment Bill (*passed*). (2) The Juries Bill (*withdrawn*). (3) The Friendly Societies Bill (*withdrawn*). The Sanitary Laws Amendment Bill dealt chiefly with amendments in points of detail of the Public Health Act of 1872, with reference to the constitution, election, borrowing powers, duties, and rights of Local Sanitary Authorities in particular cases. The Committee did not oppose this measure, since it entailed no new charges on ratepayers, whilst on the contrary it contained one provision viewed by them with considerable satisfaction, as carrying out to some extent an improvement of administrative detail which they have long advocated. The irregularity of the rates at which local authorities close their financial years has been formerly animadverted on by the Committee. This is by the present bill stopped in the case of local boards, and a further step has thus been taken towards facilitating that general and complete statement of local receipts and expenditure for a single coincident period of twelve months which the Committee have endeavoured to obtain. The Juries Bill of this session, unlike that of last, proposed to furnish from the Imperial Exchequer remuneration to overseers for their trouble in preparing the jury lists. Objection, however, arose on the part of the Treasury to the form of the provision thus made in the bill, and no amendments having been agreed to which would have removed this obstacle without burdening the local rates, the measure was ultimately, in consequence of the pressure of business, withdrawn. The Friend

Societies Bill, founded on the report recently issued by the commission, although withdrawn soon after its introduction by the Government, will probably re-appear next session. The discussion of the proposals it contained secures, however, to the Committee eminently desirable, as local taxpayers are intimately concerned in the stability and character of these societies. Two other Bills were passed this session, which called for the warmest approval of the Committee. These were: (1) The Police Force Expenses Bill (*passed*). (2) The Rating Bill (*passed*). The Police Force Expenses Bill was the necessary sequel of the financial proposals of the Government with reference to the police subvention. It simply suspended until September next the statutory limitation which up to this time has restricted the Government grant to one-fourth of the expense of pay and clothing. The Treasury were thus enabled to double during the present year the subvention to which local authorities were entitled. No proportion of the cost is by this bill finally substituted for the quarter hitherto paid, and this fact may be construed as indicating the intention of the Government to deal more generally and definitely with the question of police in the ensuing session. Ratepayers may thus view a larger contribution on the part of the Government, if not the entire transference of the cost of the force to the Imperial Exchequer as within reach. The latter course appears to the Committee by far the most satisfactory solution of the points involved, as well on grounds of justice to the ratepayers, as with a view to greater efficiency and economy in police administration. The Rating Bill of the present Government, resembled in its object that brought in by Mr. Stansfeld in the previous session. By its passing into law that extension of the rating area to mines, woods, and game which has been one of the minor points aimed at by Chambers of Agriculture from their earliest foundation, has been at length achieved. The Committee were glad to be able to afford the present measure a support which they could not so fully give to Mr. Stansfeld's bill. Although the aims of both measures were similar, it will be remembered that opposition was necessarily provoked last year by the position then accorded to the proposed extension of the rateable area. While this was offered before, and in place of general relief, the Bill gave a perpetual exemption from rates to moveable property, for which no compensation whatever had been offered to ratepayers. From these objections the Bill introduced by Mr. Selator Booth and Mr. C. S. Read was entirely free. It was preceded by an unequivocal acknowledgment by her Majesty's ministers of the chief grievance of which ratepayers complained. It was accompanied by some definite relief to ratepayers in respect of charges of peculiarly national import. It contained those directions as to the mode of assessing the new subjects of rating wanting in the former measure; and it made no attempt to obliterate from the Statute-book all record of ancient common obligations, or prejudice the general question of the relative liability of different descriptions of property. The ease of the localities which have suffered by the exemption from rating of properties occupied by the Government was not dealt with in the bill, relief having been given more simply by a direct vote in Parliament to meet local liabilities in respect of Crown property. On the whole, therefore, the committee are of opinion that the rating act of this session will be cordially welcomed by ratepayers, as removing anomalies and conferring benefits, which, although necessarily of somewhat local and limited application, are yet founded on the principle so long insisted upon that no description of property should be permitted to escape common obligations. Since the session closed the final report of the Judicature Commission has directed special attention to the proposal to appoint public prosecutors. The salaries of such officials, it is presumed by the Committee, could be in no case charged on the local rates, and the propriety of the proposition is therefore open to discussion on its own merits. The relation of the subject to that of the costs of criminal prosecutions, and the proposal of the late Government to connect the direct payment of these costs by the Treasury with a system of public prosecutors, has necessarily drawn the attention of the Committee to the matter. Whatever course be taken by her Majesty's ministers on this point, whether a more or less complete system of official prosecutors be instituted, the committee earnestly trust that the occasion will be seized for putting an end to the abuses to which they have so frequently called attention. If, indeed, the entire cost of the administration of justice be not wholly transferred, as it ought to be, to general taxation, the Committee cannot doubt that steps will at all events be taken at once by the Home Secretary effectually to stop the irregular re-imposition on the rates of charges long ago declared to be imperial, and formally assumed by the State. In their last annual report the committee referred to certain returns of local receipts and expenditure ordered on the motion of their present chairman, of which they were then expecting the publication. That relating to the nature of the audit in each class of local authority contains much useful information, and has been embodied in the last report of the Local Government Board. The analysis of receipts and expenditure will also prove

valuable in showing in a form not otherwise available the sources of income, and objects of expenditure of all rate-disbursing authorities with which alone it deals. Unfortunately it is far from perfect in its details. The heading prefixed by the Local Government Board differs from the terms of the order. The receipts and expenditures of School Boards have been omitted, and the imperfect form of the accounts of some local authorities have prevented it being as instructive as could be desired. The figures given in the return are for the year ending Lady-day, 1872, in which a sum of £18,034,803 was levied by rates. The Committee trust that the return for 1873 may be more complete than the one they have referred to, but although ordered on the same occasion it has not yet been issued. The figures, are, however, sufficient to show that the local rates have increased 80 per cent. in the last twenty years, and are now £2,000,000 higher than the amount at which Mr. Goschen estimated them in 1863. The annual poor-rate return for the year 1873 exhibits a decrease in the amount of relief given to the poor, attributable to the unprecedented prosperity of the country and to stricter administration. Still, however, the poor-rate levied has in spite of this reduction increased. In the past decade, indeed, while the cost of pauperism is but 18 per cent. higher, the demand on the poor-rate of county, police, and borough authorities has increased by 46 per cent., the cost of lunatics by 56 per cent., and the miscellaneous and unclassified expenditure which recent legislation has imposed on the poor-rate by nearly 100 per cent. The county and borough rate returns for 1873 are now available in advance of the general accounts of that year, and show an increase of £140,000 in the cost of police and lunatics. In spite of a smaller contribution from imperial sources the expense of administering justice is also greater than in 1872. Through an error in the county-rate abstract as published by the Local Government Board an apparent decline is incorrectly shown. The Committee regret to find official statistics still defective in such cases as this, though the blunders to which they called attention in these Returns while under the Home Office have been removed, and they have been much improved by the Department now superintending their issue. Some of the statistics also furnished by the Education Department present very defective results from inaccuracies in their form or their preparation. Enough remains, however, to show the severity of the charges for education newly imposed on ratepayers. Although the chief work of the School Boards has been in large towns, the country districts have suffered most heavily by the rates thus required, 9d. in the pound or more having been found necessary in twenty different rural parishes, while in forty-five other country parishes from 6d. to 9d. has been levied, and a rate of 3d. has been reached or exceeded in about half of the whole number of parishes, urban and rural, in which Boards exist. The Adulteration of Food Act appears likely to increase the liabilities of ratepayers for an object of common interest to the entire community. The appointment of public analysts has already entailed considerably enhanced expenditure in different districts, and the Committee would suggest that the operation of the Act should be very carefully watched. The consideration of reform in Local Government will continue to demand the care and investigation of the Local Taxation Committee. The irregularity of existing divisions, the confusion of jurisdiction, and the multiplication of authorities, are all evils for which a remedy is urgently demanded. A proper classification of local and imperial duties should, in their opinion, be followed by a careful inquiry as to the areas, constitution, and duties of the local governing bodies, so as to ensure not only efficient representation to the local taxpayer, but wise and economic administration. It will be the Committee's duty especially to lose no opportunity of pressing on the Government the need for the further legislation which has been promised. The entire consideration of the method in which the costs of administering justice shall in future be borne has, it must be remembered, only been temporarily postponed, Parliament having voted this expense to be distinctly national. The Committee will especially, therefore, bear in mind the necessity of securing further just and admittedly due concessions under this head in the direction already adopted by her Majesty's Government; and while the promises of the Chancellor of the Exchequer with reference to the possibility of ultimately handing over to local authorities some branch of the general revenue will have to be steadfastly kept in view, every means of increasing the resources of local authorities and diminishing their sole reliance on the rates must be attentively regarded. This course is particularly to be desired in view of the increasing attention now being directed to Educational and Sanitary matters, all involving heavy local expenditure, while the necessity for prompt and general road legislation points in the same direction. The gradual abolition of Turnpike Tolls continues to prejudice ratepayer's position. It is useful, therefore, to resist additional rites on this account, and to secure (if in some form or another tolls cannot be maintained) that by the appropriation of some local source of revenue the users of the highways should equitably contribute to their maintenance.

Mr. PELL moved that the Report be received.

Sir GEORGE JENKINSON, M.P., for one, could not accept the Report without discussion.

Mr. CORRANCE did not regard the remission already obtained altogether satisfactory, as so small a portion of it had been applied in relief of rural ratepayers.

It was stated that only the reception and circulation of the report would be asked, and a motion to this effect was agreed to.

Captain CRAIGIE presented the Report of the Committee on a Government Department of Agriculture, which was as follows:

The Committee appointed by the Council on the 14th April, 1874, to consider the best means of giving effect to the views of the Council with reference to a Government Department for Agriculture, and who were instructed to confer with the Association of Chambers of Commerce with reference to their proposal for a Minister of Agriculture and Commerce, have agreed to the following Report: 1. Your Committee are of opinion that the duties of a separate and consolidated Agricultural Department of the Government should embrace all matters specially affecting agriculture, now dealt with by various Government offices, and that they should specially include: A. All supervision connected with the importation, transit, traffic, and diseases of live stock. B. All supervision necessary for arterial land drainage and in connection with Commissions of Sewers and Embankments. C. The duties now discharged by the Copyhold Title and Enclosure Commission. D. The collection, tabulation, and publication of agricultural statistics and corn returns. 2. Your Committee consider that a separate department charged with these duties should be presided over by a Parliamentary Secretary. 3. Your Committee having proceeded to confer with the Association of Chambers of Commerce on their proposals, arranged a meeting on the 4th June, 1874, when Mr. Sampson Lloyd, M.P., chairman of the Association of Chambers of Commerce, Mr. H. W. Ripley, M.P., Mr. John Whitwell, M.P., Mr. Moore, of Plymouth, and Mr. Hawkes, of Birmingham, on the part of the Chambers of Commerce, met and discussed the points at issue with Mr. G. F. Muntz, chairman of the Central Chamber of Agriculture, Mr. George Storer, M.P., Mr. H. P. Price, Captain Craigie, and Mr. J. Algeron Clarke, on the part of your Committee. Your Committee, as the result of the conference, are of opinion that the combined interests of agriculture and commerce would be materially advanced by the creation of a new Ministry embracing two separate and distinct departments, each presided over by a Parliamentary Secretary, and each possessing separate and permanent official staffs—the one department dealing exclusively with agricultural and the other with commercial matters. In such a case the duties now belonging to the Board of Trade might conveniently devolve on a new commercial department. Your Committee further recommend to the Council that they should request a member of Parliament representing agricultural interests to bring before Parliament early next session a resolution affirming the expediency of creating such a Ministry of Agriculture and Commerce; and they suggest any member of Parliament undertaking this duty should be requested to concert with the Chairman of the Association of Chambers of Commerce as to the form of resolution to be proposed and the best time for its introduction.

Mr. STORER, M.P., said the Business Committee having regard to the fact that the question was a comparatively new one, had simply suggested that the Report should be received on that occasion, in order that it might be submitted to the local Chambers of Agriculture with a view to its being discussed at a future meeting. They felt that agriculture had not received for many years past, and did not now receive, that degree of attention from the State which from its importance it deserved. The commercial community seemed to hold a similar opinion with regard to their own affairs, and the result was that there had been united action in reference to that question. He had now to ask them to receive the Report with a view to future discussion; and this was agreed to.

The next subject on the agenda being "Highway Legislation."

The CHAIRMAN entered into a statement in reference to the course which had been pursued with the view of ascertaining the opinion of the Associated Chambers on the most important questions included in that subject. From a circular before the meeting, dated September 29, it appeared that the following questions were addressed to those bodies: 1. Is an entire re-organisation of our road system in England, including the management and maintenance of turnpikes and highways, desirable? 2. Is a reclassification of all roads needed? 3. How many different classes of roads should be established under a new system? 4. How should the funds be raised, and from

what sources, for the maintenance of each class of road? 5. What should be the constitution of the governing body of the whole or of any one class of roads? After giving a statistical statement in reference to the answers received to these questions, the Chairman said the Business Committee had not expected that there would be anything like such a majority as there was in favour of district boards. The resolutions now to be submitted on that subject were, he intimated, based on the balance of opinion on the different points found in the replies; and he added that although the Business Committee had embodied the views expressed in the resolutions now to be considered, yet they felt themselves individually at liberty to take any course that they might think proper on that occasion. In conclusion, he stated that, having heard that there had been legislation recently in the Isle of Man in reference to highways, he wrote in his official capacity to the Chairman of the Highway Board there for information on that subject, and he read the reply, in which it was stated that the duties paid for wine and spirit licences were appropriated to the maintenance of the highways.

After some discussion as to the order in which the resolutions should be taken, Mr. C. S. Read, M.P., having expressed the opinion that No. 6 should be taken first, as it raised the important question whether or not highway districts should be made compulsory, and it having been arranged, as was understood, that No. 6 should be taken second,

Mr. G. WHITAKER-WILSON moved the first resolution of the series on the Agenda, viz.: "That in the opinion of this Council a re-organisation of the road system of England is urgently required." It was, he observed, very desirable that the local Chambers should send as definite answers as possible to all questions addressed to them by the Council of the Central Chamber; but many of the answers received in the present instance were so vague that it was very difficult to determine what was meant. Nothing had surprised him more than the preponderance of opinion in favour of making the adoption of highway districts compulsory (Hear). He was not at all prepared for that, nor was he prepared to support such a view; and he thought the Chairman was quite right in claiming for the members of the Business Committee the right to adopt personally whatever course they pleased at that meeting.

Mr. ANTHONY seconded the resolution.

Mr. CORRANCE said he felt bound to ask himself what would be the ulterior consequences of adopting the resolutions now submitted. That question was not a party one. There had always been a number of persons in the Legislature who were in favour of the extension of highway districts. The question was first taken up in Parliament by Mr. Knatchbull-Hugessen as a member of the late Government, and it was handed over by him to the present Government. He (Mr. Corrance) would say nothing about the intentions of the present Government, because he did not at all know what they were (laughter); but the object of the late Government was to establish a compulsory system of highway districts. So long as the burden of maintaining roads was cast on parishes the voice of complaint was sure to be heard, but he supposed it was thought that when the area of the burden became extended the combustion would not be so great (laughter). If they committed themselves to the propositions before them, where would the matter end? The Government would then ignore complaints from different localities, and deal with the question in what was, he believed, called "a comprehensive manner" (laughter). He wanted to know what course the Government would pursue if the resolutions on the Agenda were passed. He saw some members of the Government present, including one who had raised himself to his present position by the proofs which he had given of capacity, and who was well able to answer any questions which might be put to him. He would now move as an amendment: "That before we commit ourselves to any direct condemnation of the present system, it is expedient that we should know what are the views of Her Majesty's Government on this question."

Mr. HICKS seconded the amendment, observing that the Cambridgeshire Chamber, which he represented, had passed unanimously a resolution to the effect that the best principle for maintaining the roads of this country was the old common-law principle of parochial responsibility.

Mr. READ, M.P., said, having been so pointedly referred to by his friend Mr. Corrance, he begged to say that he did not attend that meeting as the Secretary of the Local Government Board, or even as a member of Parliament (Hear, hear).

He was Chairman of the Norfolk Chamber of Agriculture, and he was present on that occasion simply and solely as a member of that Council. He should not betray any Government secrets, for the best of all reasons—namely, that he did not know any (laughter). He was a very harmless individual as regarded Cabinet secrets, but he would do what he could in his private capacity to resist the establishment of a compulsory system of highway districts (Hear, hear).

On a show of hands the amendment was negatived, and the original resolution was then adopted.

The meeting being then about to consider the sixth resolution, declaring, "that the system of highway districts should be made compulsory" &c.

Mr. D. LONG contended that all the resolutions ought to be taken in the order in which they were placed by the Business Committee.

Mr. T. WILLSON having moved, and Mr. T. J. ADKINS seconded, the foregoing resolution,

Lord HAMPTON said he thought that, as a rule, the arrangements made by the Business Committee should be strictly adhered to, great inconvenience being involved in a contrary course.

Sir G. JENKINSON, M.P., then formally moved that resolution No. 2 be taken next.

Mr. D. LONG seconded the amendment.

On a show of hands there were 22 for the amendment and the same number against it. The Chairman having given his casting vote in favour of the amendment, declared it to be carried.

Mr. GARDINER then moved, "That in the opinion of this Council all roads should be distinguished as 'First-class' and 'Second-class' roads respectively." He maintained that, under the existing system it was almost impossible to carry on highway legislation beneficially. There were two classes of roads in the rural districts; one consisting of old highway roads, and other roads on which traffic was concentrated, and the other of roads which existed for the convenience of people living in the parish; and they should, in his opinion, be classified in the manner that he now proposed. Such a classification would tend to enable them to obtain imperial assistance for the maintenance of the first class of roads. No one could suppose that the Legislature would ever consent to aid in the maintenance of the second class of roads, but for the first, which might legitimately be demanded.

Sir G. JENKINSON, M.P., in seconding the resolution, said he thought the division of roads into two classes very important, and in his opinion the disturnpiked roads ought to be included in the first class.

Mr. BIDEELL believed that the proposed classification would tend to perpetuate existing evils. He was strongly of opinion that all roads ought to be under one management, and that the cost should be a district instead of a parochial matter. He was quite aware that the present highway enactments required material alterations (Hear, hear), and his observations depended partly upon a modification of them.

The CHAIRMAN said he wished to put it to the meeting at that stage of the proceedings whether they thought that the having two classes of roads would necessarily involve the having two governments (Loud cries of "No, no").

Mr. WILBRAHAM EGERTON, M.P., remarked that there were 850 local boards in the country—boards most of which had entered into various contracts, and it was impossible to deal with that question properly without considering their position.

Lord HAMPTON thought they had better confine their attention to the question actually before them (Hear, hear).

Mr. A. PELL, M.P., said it would almost appear as if a good road was to be a road along which a carriage might travel, and a bad road one which was only fit for a dung-cart (laughter).

Mr. T. DUCKHAM proposed an amendment to the effect that there should be only one class of roads, basing his proposal chiefly on the ground that having separate classes of roads would involve the necessity of having separate accounts. For want of uniformity of management he had himself, he remarked, as chairman of a highway board, every month to go through 72 sets of accounts instead of one.

Mr. D. LONG seconded the amendment.

Mr. G. WHITAKER-WILSON argued that there must be two classes of roads. It was necessary to have wider roads in the neighbourhood of a market town than elsewhere.

Mr. YELLAND supported the resolution.

Mr. ARKELL observed that the public had as much right to travel over the parish roads as over others. He was in favour of having only one class.

Mr. MASTEN remarked that one of the chief sources of expense was supervision, and if there were two classes of roads the expense of supervision must be doubled.

Mr. LIPSCOMBE said it seemed to have been overlooked that turnpike trusts were expiring all over the country—a fact which had a material bearing on the question under discussion. The greater part of the West Riding of Yorkshire, with which he was connected, was now under the Local Government Board, and they were not particularly anxious to take in hand expiring trusts.

The CHAIRMAN observed that they were not then on the question of turnpike trusts (Hear, hear).

Mr. LISCOMBE proceeded to say that he was strongly in favour of their maintaining their authority over parish roads, while he thought the cost of the main arterial roads ought not to fall entirely on the ratepayers. It was against all experience that bye-roads should be kept in as good condition as main or turnpike roads ("No, no").

Professor BUND said there always had been two classes of roads in this country ("No, no"), and if they did not maintain such a division they would lose their claim upon the Government for assistance.

Mr. ANTHONY observed that if there were two classes of roads there must be two establishments to manage them. ("No, no").

Mr. ADKINS supported the amendment.

Lord HAMPTON said according to his view of the matter good bye-roads were quite as essential to the public convenience as good highways. Then came the question—and it appeared to him that their function as a council was to deal with that question—in what way the object could be secured on the most economical principles. It struck him that if they had only one class of roads they would have greater unity and greater simplicity of management than could be secured in any other way. On the other hand, he thought that the having two classes of roads would almost of necessity involve the having two systems of management ("No, no"). At all events he was in favour of having only one class of roads, and in his opinion that would prove the best for all concerned.

Mr. READ, M.P., said, it appeared that all who were strongly in favour of having only one class of roads had made up their minds in favour of highway districts ("No"). If they had compulsory highway districts, and a general assessment as well, they might have but one class of roads. Without a general assessment nothing could be more iniquitous than to perpetuate the present system of throwing the maintenance of the arterial thoroughfares of the kingdom upon the parishes.

Mr. SCOTSON thought there should be only one class of roads, with county management and a county rate to keep all the public roads in proper order.

Mr. STOKER, M.P., said he was in favour of having a system of highway districts combined with a small contribution from the Imperial Exchequer.

Mr. PACET, M.P., thought that on the whole the balance of argument was in favour of having first and second-class roads, but he thought it should be clearly understood that that division could not involve a separate system of management.

Sir G. JENKINSON, M.P., said his idea was that there should be one class of roads partly maintained by the Government and another class maintained by means of district rates. He had no desire to see two systems of management.

Mr. H. NEILD said as regarded the question from what sources the roads were to be supported, he believed that any expectation of assistance from the Consolidated Fund was a forlorn hope (laughter).

Mr. Jabez TURNER said the question now seemed to be whether the adoption of the amendment would involve the giving up all idea of obtaining Government aid. It was not to be supposed that any government would grant a subvention for the common parochial highways of the country. In his opinion they must either abandon the hope of getting assistance from the Government, or they must adhere to the present natural subdivision of roads.

Mr. A. PELL, M.P., said both the Chambers to which he belonged in the Midland Counties had decided in favour of hav-

ing but one class of roads, and on that point he agreed with them most thoroughly. All that had been said about having two classes of roads and only one management was illusory. Whether it was the Government or the magistrates who entrusted local bodies with money they would accompany it with control. What lay behind the whole of that question was the desire of the Chamber to get a subsidy from the Government, and it seemed to be felt that they could get a subsidy for one class of roads and not for another. Under the system contended for the roads would be divided into two classes, one the macadamised roads, the other the macadamisable roads (laughter).

Mr. TURNER (Kent) said they had just been told that the expectation of getting assistance from the Government for roads was a forlorn hope. Well, let them have even a forlorn hope rather than no hope at all. If they had only one class of roads they would not have the least chance of obtaining Government aid; all their efforts would end in disappointment.

A show of hands was then taken, and the result was that the amendment was rejected and the resolution adopted; the numbers being for the amendment 23, for the resolution 26.

Mr. FORD then proposed the third resolution, viz.: "That 'First-class' roads should comprise the present and former turnpikes, except those which, by diversion of traffic, have become disused as main roads, and include such highways as shall be determined to have become main thoroughfares; and that 'Second-class' roads should consist of all other highways."

This resolution having been seconded by Professor Bund, Sir G. JENKINSON, M.P., moved, as an amendment, "That 'First-class' roads should comprise all turnpike roads of which the trusts either have been or may hereafter be abolished, and that 'Second class' roads should consist of all other highways."

Mr. D. LONG seconded the amendment.

Mr. PAGET, M.P., thought it would be much better to leave the resolution as it was proposed.

Mr. BIDDELL expressed his regret that many gentlemen present appeared to be so much influenced by the idea of their getting their hands into the Government purse. The real question before the Council was what would be the best mode of maintaining highways in good condition.

Mr. WILBRAHAM EGERTON, M.P., said, as a member of the Parliamentary Committee on the turnpike roads, he had arrived at the conviction that unity of management was impossible under the present system, and would be so even if this adoption of highway districts were made compulsory. There were 1,172 miles of turnpike trusts now in the hands of local boards, and those local boards were so mixed up with the highway boards that the main roads of the country could not be properly managed. He thought that first-class roads should be under county management or supervision, and second-class roads under local management.

Mr. CORRANCE considered a resolution like that proposed utterly useless. The whole difference of opinion among them seemed to turn on the question whether they were going to receive any assistance from the Government, and he had entirely failed to elicit a scrap of information on that subject (laughter).

After a few remarks from Capt. CRAIGIE, the amendment was put and negatived.

Capt. Craigie then proposed, as an amendment, to insert after the word "determined" "by the contributing authority."

The amendment was seconded by Mr. Fell and objected to by several gentlemen on the ground that it anticipated questions involved in succeeding resolutions. It was ultimately rejected, after which the resolution was carried by 22 votes, giving a majority of 14.

Mr. LIPSCOMBE moved the next resolution—viz., "That the funds for the maintenance of roads in the first-class should be provided from county or district rates, aided by contributions from imperial taxation, and that such contributions should be derived from a tax on different classes of vehicles, graduated in proportion to their wear of the roads."

Mr. STRATTON seconded the resolution, and maintained that nothing could be more just than that carriages which were used on the roads should help to maintain them.

Mr. STORR, M.P., hoped the Council would consider well before adopting the second part of that resolution (Hear, hear).

He would be happy to vote for the former part, but if the latter part were adopted agriculturists might, through their carts and waggons and their ploughing and thrashing-machines be exposed to the most grievous burdens. He moved that the latter part of the resolution be omitted.

Mr. GARDINER seconded the amendment.

Lord HAMPTON thought the resolution as it stood was open to most serious objection. It was perfectly competent to them to ask the Government for assistance with regard to the roads, but by laying down what the Government ought to do with respect to a particular kind of taxation, they were travelling entirely out of their province, and putting themselves in the position of the Chancellor of the Exchequer (Hear, hear). He hoped that for the sake of the credit of their proceedings the latter part of the resolution would be omitted.

It was then agreed that the resolution should stop at the words "imperial taxation," the latter part, relating to the tax on vehicles, being omitted.

Sir G. JENKINSON, M.P., said, the horse duty having been thrown away, he wanted to prevent the carriage-duty from being also thrown away; and he had reason to believe that if the agricultural community asked with one voice that the carriage-duty might be granted in aid of the cost of turnpike roads, it would be done. He concluded by moving as an addition to the second part of the resolution as abridged, "And that such contributions should be derived from the licenses now levied on carriages."

Mr. BIDDELL having seconded the amendment, it was put and negatived, and after some further discussion the resolution was carried by a large majority.

Mr. STOREY, M.P., then moved and Mr. TRASK seconded the following resolution: "That roads in the second-class should be maintained out of parish or district rates."

Mr. READ, M.P., said he felt considerable difficulty as to how he should vote on that question. If they were to have highway districts let them be good ones, and they could not have good ones without a union rate. They must take away the management from the parish and place it in the hands of a board, and the rate should be spread over the whole district.

After some further discussion the resolution was adopted.

Mr. WILBRAHAM EGERTON, M.P., omitting the concluding part of the sixth and last resolution, proposed the following: "That the system of highway districts should be made compulsory, but with material amendments in the existing Acts." [The words passed over were "and that both classes of roads should be under the management of highway boards, the first-class roads being subject to county inspection."] He observed that in Cheshire they had had experience of the compulsory system for the last ten years, and had found it to work remarkably well.

Mr. H. NEILD, in seconding the resolution, spoke of great hardships to ratepayers in his own district in consequence of the adoption of highway districts not having been made compulsory.

Mr. RUSSON moved as an amendment, "That the system of highway districts having increased the expenses of management without causing corresponding improvement in the roads, it is not desirable to make the Highway Acts of 1867 and 1874 compulsory throughout the country." In Worcestershire, he said, to which he belonged, the system now advocated had created great dissatisfaction, and similar advantages to those which it conferred had been obtained in other districts at much less expense.

The Rev. E. C. PERRY seconded the amendment, and said the experience of the system in Staffordshire was similar to that just mentioned by Mr. Russon in speaking of Worcestershire.

Sir G. JENKINSON, M.P., observed that the result of returns for the districts where the system had been adopted was this—that in 215 cases the report was satisfying and in 107 cases doubtful, and only a very small number were adverse; while all acknowledged the improved condition of the roads.

Mr. READ, M.P., thought the question was whether one surveyor could properly look after 200 miles of road. If the waywardens could do the work of the surveyor the highway district system might answer exceedingly well (cheers).

Lord HAMPTON said that at the Worcester quarter sessions he had always advocated the adoption of the district system, because he believed that the principles of the Act were sound. He admitted that in some particulars the Act required amendment, and they now had sufficient local know-

ledge to assist Parliament in dealing with the question of amendment.

Mr. CORRANCE said the conclusion which he drew from all that he had heard at that meeting was that it was generally considered that they must give up the idea of Government assistance, and form districts so as to impose onerous obligations on the ratepayers.

The CHAIRMAN observed that the number of votes of local Chambers in favour of highway boards being made compulsory was 18 out of 30.

Mr. GARDINER said that in Suffolk and Essex the general opinion was one of great dissatisfaction with the district system, on account of the increased expenditure.

Mr. STORER, M.P., said he believed that highway districts had given general satisfaction, and that where the case was otherwise the cause was the election by the ratepayers of inefficient waywardens or the appointment of an inefficient surveyor.

Mr. WHITAKER-WILSON was contending, in opposition to Lord Hampton, that the district system had not worked well in Worcestershire, when

Mr. CORRANCE moved the adjournment of the debate, and Mr. GARDINER seconded the motion.

Mr. STORER, M.P., remarked with animation that if such tactics were to be carried out, gentlemen who, like himself, had come a distance of two hundred miles to attend that meeting would not be likely to come there again.

The CHAIRMAN said he must remind the meeting that the question had been before the Council for many months, and that as yet it had done nothing. He then put the question that the debate be adjourned, and it was negatived by a large majority. He then put the amendment. Only eleven hands were held up in favour of it, and it was declared to be lost.

Mr. READ, M.P., said he should demand a scrutiny.

Lord HAMPTON said he hoped the question would be settled with perfectly good feeling. The minority should yield to the majority. In no other way could the proceedings of such a body as that be carried on satisfactorily, and he was sure Mr. READ would be the last person to deny that.

Mr. READ then withdrew his demand for a scrutiny.

Sir G. JENKINSON, M.P., moved as an amendment the addition to the resolution of the following words, which came as it stood in the Agenda: "And that both classes of roads should be under the management of highway boards."

This amendment having been seconded by Mr. CARPENTER, was submitted to the meeting and negatived, the numbers being 13 for and 14 against it.

The original resolution was afterwards adopted by a large majority—23 to 6; and this being the last resolution relating to highways the subject dropped.

It was then agreed that the appointment of a Minister of Agriculture should form the chief subject of discussion at the December meeting, and that at the February meeting the Council should "consider the reports and summary schedules on agricultural customs presented by the Committee on Unimproved Lands, and also proposals of that committee towards legislation."

On the motion of Mr. READ, M.P., it was agreed that the amendments required to be made in the Highway Acts should be discussed at the annual meeting.

The proceedings then terminated with a vote of thanks to the Chairman.

TO THE EDITOR OF THE MARK LANE EXPRESS.

SIR,—I have reason to believe that when Lord Hampton expressed surprise at my request that the division upon Compulsory Highway Boards should be tested by a scrutiny, his Lordship was not aware of the power of the District Chambers to record their votes by proxy. If the voting power of the minority had been thus tested, our small band of eleven would have been found to be far more important than it appeared to be. If I mistake not, the delegates from Worcester, Warwick, Stafford, Lincoln, East Suffolk, and Norfolk voted in the minority, and they alone were entitled to thirty-nine votes. This will show that I had good reason for making the request, which—at the late period of a long meeting, and in deference to the request of Lord Hampton—I did not press upon the Chamber.

Yours,

Farmers' Club, Nov. 4. CLARE SEWELL READ.

THE SCOTTISH CHAMBER OF AGRICULTURE.

At the annual general meeting, held in the Hall of the Chamber, Edinburgh, Mr. A. MACNEEL-CAIRD the retiring president, in the chair, the following counties' reports were given in:

ABERDEENSHIRE.—The meeting of the Aberdeen members was held in the Corn Exchange, Aberdeen, on Friday. Mr. M'Combie presided, and was re-elected chairman and county representative. Mr. Barclay, M.P., Copland; Mill, of Ardlethen; M'Donald factor, Cluny; and Adamson, Balquharn, were appointed the County Committee for next year.

FORFARSHIRE.—A meeting of the members resident in Forfarshire was held in Brechin on Tuesday of last week—Mr. Robert L. Mustard, chairman, presiding. The meeting appointed the following members of the Counties Committee for the ensuing year: Mr. Alexander Anderson, Berryhill; Mr. James Young, Fardhouse; Mr. William Goodlet, Bolshan; Mr. William Smith, West Drums; Mr. J. M. Nicoll, Littleton; Mr. Wm. Arnot, Mains of Glamis; Mr. Wm. Smith being representative member. The meeting were of opinion that the bill introduced by Lord Huntly, so far as consistent with the resolution of the Chamber, be approved of, but inasmuch as it fell short in many essential points, recommend the Chamber to enter into communication with his Lordship on the subject, and remit to a committee for that purpose. The meeting recommend the Chamber to disapprove of the draught bill of Sir Robert Anstruther on Hypothec, and petition Parliament in favour of Mr. Vans Agnew's bill for total repeal.

ROXBURGHSHIRE.—This body held a meeting in the committee room of the Corn Exchange, Kelso, on Friday. The members present were—Mr. Clay, Kercheesters; Mr. Ballingall, Clairlaw; Mr. Munro, Fairington; Mr. Riddell, Hundalee; Mr. Main, Kelso; Mr. Robertson, Ladyrig, &c. Mr. Riddell submitted the following motion: "That the above committee are of opinion that the land-tenancy laws ought to receive the urgent attention of the Scottish Chamber of Agriculture, and that the Chamber should endeavour to have these laws altered so as to give complete accuracy to capital invested by tenant-farmers. The committee are also of opinion that success much depends on advocating compensation to the owners of land, whose tenants may have deteriorated their farms, thereby lessening their letting or market value." After a few comments on the resolution, it was unanimously agreed to. Mr. Riddell and Mr. Scott, Spylaw, were deputed to bring this resolution before the counties committee meeting.

AYRSHIRE.—This meeting was held on the 3rd instant at Ayr. Mr. Young, Kilkenny, presided, and was re-elected representative member. The following resolution was adopted: "As there is a growing dissatisfaction amongst farmers as regards the operation of the land-tenancy laws, more especially to the want of provision being made whereby compensation should be given for all permanent improvements and unexhausted manures, we are of opinion that the Chambers should take whatever steps they consider best to accomplish that object."

KINCARDINESHIRE.—A meeting of the members of the Chamber of Agriculture resident in the county of Kincardine was held on Monday in the Corn Exchange, Laurencekirk—Mr. George Lorgie, Haulkerton Mains, in the chair. Mr. W. Alexander, Bart., of Haulkerton, was elected representative member; and Messrs. David Mitchell, Burnton; Alex. Taylor, Cuslnic; and William Burgess, Bedford; members of committee. It was thereafter proposed and unanimously resolved: "That this meeting urge the Chamber (while steadily using all efforts to obtain repeal of the Law of Hypothec, and such modification of the Game-laws as may be attainable) to concentrate its chief efforts upon obtaining from Parliament a measure to legalise Tenant-Right to a similar extent as was granted by a former Government to the tenant-farmers in Ireland."

The Secretary (Mr. Curror) read the Treasurer's statement for last year, which showed that the funds in bank amounted to £521 19s., that the Chamber had property of the value of £139 18s., and that there were £710 of arrears of subscriptions.

On the recommendation of the Counties Committee the following gentlemen were elected office-bearers of the Chamber for the ensuing year: President—Mr. David Cunningham, Chapelton, Ardrossan. Vice-Presidents—Messrs. Joseph

Harper, Snowdon, and Riddell, of Hundalee. New Directors—Messrs. A. Macneel-Caird, R. M. Cunningham, Shields, Ayr; Bethune, of Blebo; R. Scot Skirving, Drem; and James Johnstone, Moffat. Messrs. Henry Adamson, Alford, and John McCulloch, Glenhead, Stranraer, were elected new members.

Mr. MACNEEL-CAIRD delivered his retiring presidential address. He said: The political events of the past year have prevented any progress being made towards the legislative settlement of agricultural questions. The time at which the new Government came into office is a sufficient excuse for their not having dealt with these questions in the late session of Parliament. But that cause of delay is now at an end. There are men in the Government capable of dealing, and I believe willing to deal, with these questions, in a wise spirit. But it seems to be supposed that they have colleagues pulling the other way. And it may be that we shall thus have the spectacle of a Government paralysed by internal differences on questions of vital importance to the country. But I trust that it will not be so. And it is our part to show that the claims we support are reasonable, in order to strengthen the hands of those who are friendly to a reasonable solution of them. I propose on this occasion to refer specially to a subject which is of interest in England as well as in Scotland. As to compensation for tenants' improvements, the ordinary rules of our law on such subjects are not unfounded in reason. If an artist paints a valuable picture on another man's canvas, the principal subject—the picture—belongs to the artist, but he must pay for the canvas. If a man, in good faith, builds a house on land which turns out not to be his, the house goes to the owner of the principal subject—the land—but as a general rule, he must pay for the benefit he has got by the building. The greatest of Scottish lawyers taught, nearly 200 years ago, that if a man, even in bad faith, built on another's land, the owner was bound to repay him, to the extent to which he took profit by the work. He adopted this dictum of a great Roman jurist, "Natural justice suffereth not that we enrich ourselves with the spoil of others." And although in more modern times a wrongdoer's relief has not been sustained to that extent, the very judges who refused him that relief suggested that even a wrongdoer might have right to remove the buildings. But what we have to complain of is that if the man who builds or executes improvements has the misfortune to be a tenant-farmer, he is made an exception to all these rules. His good faith counts for nothing. The law, as it stands now, gives him no right to compensation. It refuses to him even the right to take away his materials, though it might perhaps give that right, as I have said, to a wrongdoer, whose possession was usurped or unlawful, and would certainly give equitable compensation to any person, not a tenant, who, with good faith, had made the same improvement on another's land. That relief would, of course, be limited to the extent to which the owner profited, the very limit which we propose to attach to a tenant's claim. The improvements created by a tenant's skill, capital, and industry are in substance and in justice, though not in law, the property of the tenant who makes them. No doubt they are attached to or combined (and in the case of drains and manures inextricably combined) with land which belongs to another. But the just solution of that state of things is not that the one right should swallow up the other without compensation, but that the owner of the land who takes such improvements should pay for them, according to the benefit which he appropriates; and that the tenant-farmer should thus cease to be oppressed by an exceptional law. That law robs the tenant of his property when he is evicted without compensation. And this species of injustice is, probably, productive of much greater injury to the community than even a robbery by violence, because it operates on a much wider scale; and by the fear of subjecting tenants' property to confiscation, spreads distrust everywhere, and defers great numbers of tenants from making the expenditure which is necessary for due cultivation and for the unrestricted growth of food. It also warns off much free capital which would naturally seek profitable investment in agriculture, if the law did not make it artificially insecure. Thus the injustice operates with great severity on the occupier, while the loss to the country from restricted production is incalculable. But if, by making the municipal law just, and allowing natural laws to act, capital were made safe to come freely to the enrichment of the soil, and the development of agriculture, a country peopled and wealthy as this is

—so many mouths to be supplied, and such abundant means to supply them, if you took away hindrances—this country, I say, would rapidly exhibit such a change, and such an expansion of growth, as is almost inconceivable to those who have not attended to the results which may be attained by the application of capital to land, with freedom and judgment. And who would lose by it? No doubt, under the present system, a landlord may now and then snatch an advantage by unexpectedly appropriating an occupier's improvements without compensating him. But that, though it rankles deep when it occurs, is necessarily exceptional. Most men beware of subjecting themselves to it. Every flagrant instance of it makes them more wary. Still cultivation would be worse, and tenants' improvements more rare than they are, if landowners generally were to use to the full the advantage which the law gives them. The main action of the law is really as a deterrent. Landowners as a body are thus, in truth, great sufferers by this and by every thing that hinders the enrichment of the soil that belongs to them. Their rents are just a share of the profit derived from the land. The greater the production and profits, the greater in the long run will inevitably be the share going to the landlord. None gains more surely than the landowner by the general prosperity of the country. From 1857 to 1870 the land rental of Scotland rose steadily 29 per cent.—£5,932,000 in 1857, £7,194,000 in 1870. If I had the figures down to the present time I feel convinced one-third at least has been added on the average in that short time to the annual rent of land over Scotland as a result of the general prosperity. And what could more increase the prosperity of the country, and by consequence the prosperity of the landowner, than a vast increase to the productiveness of the soil in whose profits he must inevitably share? The more also you take away disadvantages which oppress the occupier, and the more you enable him to profit freely by the use of his means and industry, the more will he find it necessary, and the more will he be willing, to enlarge the landlord's proportion of profit, when, even so enlarged, it leaves a better profit to himself. If I might venture to put into words what I believe to be the prevailing opinion of the best tenant-farmers in Scotland, it is not the rent that troubles them; give them just security, do away with the artificial hindrances which hamper their industry, and I don't think they will quarrel with the rent, or complain that it advances with the progress of emancipated agriculture, and the general prosperity of the country which that progress will promote. But I must deprecate the use in regard to this question of the vague phrase "Tenant-Right." It is a phrase of very uncertain meaning, even in Ireland, where it originated. In Ulster it means a tenant's right by custom to sell the goodwill of his farm though he has no lease; and not only may have made no improvement on the farm, but may have brought it to the most miserable and exhausted condition. I need not say here that that in no degree resembles our present claim. The incautious use of such a loose phrase has occasionally enabled a bold antagonist to escape without much discredit under cover of a general declaration against "Tenant-Right," who might perhaps have been ashamed to avow in plain words, or even to himself, the desire to confiscate the improvements made by his tenants without giving any allowance for them. The complaint is not that another tenant gets the farm over the head of an old tenant, not that the old tenant might not have had it by paying more rent than he chose to give, but that the landlord pockets a rent increased by reason of the old tenant's improvements, and evicts him without giving him a penny for the improvements, even where they cannot be denied. When a controversy of that kind arises, it may be fitly tested by this simple question: Was the evicted tenant fairly paid for his unexhausted improvements, or is the landlord (by availing himself of the unjust state of the law) enjoying a rent enhanced by these improvements, without having paid for them? If you apply that test it will disperse much of the haze which arises in such cases from contradictions and controversy. The claim which this Chamber makes is that the law on this subject should be made consistent with natural equity, so that the tenant shall have right on removal to payment for his improvements and unexhausted manures, ascertained when necessary by qualified valuers or arbitrators. Skilled men of practical experience would examine the evidence of expenditure (as one, but by no means the only check), they would also see the actual condition of the farm, inspect the works, and ascertain their efficiency, their fitness for the

holding, their actual results and durability, and would be quite able in practice to arrive at just conclusions. And I may say, using a few words on the subject which have already been in circulation among ourselves, that in practice these compensations will in general not be paid by the landlord, but will be ascertained and settled between the outgoing and the incoming tenant. The landlord can always, and will usually, make stipulations to that effect in letting his farm to a new tenant, unless he sees that he can get a better rent by paying the compensation himself. The measure of compensation ought never to exceed the letting value added to the farm by the tenant's improvements as at the date of his removal, taking into account all deteriorations which can be brought against him. The unstinted expenditure in manures, which a just system of compensation will encourage the tenant to make, and to continue till the close of his occupation, will be a new security to the landlord (of which he cannot be deprived) for payment of the rent, and fulfilment of the tenant's obligations. It is of high public policy that a state of the law should be amended, which, by causing insecurity, hinders the full use of capital to increase the productivity of the soil. To amend that state of the law in a wise spirit, with due consideration of all the interests involved, will result in a vast enlargement of growth, especially of food, and, by consequence, will add immensely to the annual income and wealth of the country, to the fund for the employment of labour, to the prosperity of manufactures and commerce, to the comfort and contentment of the people, and thus to the security of property, and the general welfare of the nation. There is a great work here which has to be done—it may be now, it may be after a time, not a long time. The claims of justice and policy united cannot be disregarded long. But be it soon or be it later, the statesman who having the power shall also have the will and courage to release agriculture from the trammels of unwise laws shall inscribe as their memorial in the hearts and history of the people, that they added to the productive resources of their country, and to the comforts of the people, not merely by millions, certainly by twenties of millions; and if they leave no flaw in the security thus given to the cultivator, it may be eventually by hundreds of millions a-year. They can now in a time of calm trim the vessel with deliberation and safety. Who so rash as counsel that they should wait for the hurricane, at the risk of bringing the overstrained masts by the board, when they loose command of the ship? As to the law of arbitration, this chamber having recorded its opinion that when the parties cannot agree arbitration is the fittest mode of settling the just amount of compensation, this leads me to say a few words on an allied subject which, so far as I am aware, has not yet been publicly discussed. The law of arbitration in Scotland is in some respects in a most unsatisfactory state. One point I may illustrate by a case which arises almost every day. A landlord and tenant entering into a lease, say for nineteen years, agree in the lease that all differences which may arise between them shall be settled by arbitration, but that agreement is of no legal effect unless they have actually named the arbitrator. And in a contract of such endurance, how can they beforehand name an arbitrator with any confidence that when his services are required he shall be alive, or within reach, or qualified, or willing to act? This rule is, moreover, so absolute that even if the parties, to escape from the difficulty, agree in designating an arbitrator as the holder for the time of a public office, such as the Sheriff of the county, the Dean of the Faculty of Advocates, or the Lord Advocate, the law will set the arbitration aside. Nay, though the parties have effectually named their man, so as to create a binding and perfect arbitration, if he should die, or permanently leave the country, or become disqualified, or decline to accept, the law will do nothing in furtherance of their agreement to arbitrate. In the face of that agreement either can drag the other into Court, and insist on having their differences settled by litigation. Well, but let us suppose the parties have got a step further—they have not only agreed to settle their differences by arbitration, and effectually named their men—two men mutually chosen, with power to choose an umpire or oversman, and these men have accepted and entered on their duties, but have unfortunately disagreed on the questions in dispute, and can't agree on an umpire (a very common case), the whole thing tumbles down like a castle of cards, and once more the parties must fight out their disputes in the Courts of Law. In short, there are as many pitfalls in the Scottish Law of Arbitration as if they had been contrived to create work for

courts and lawyers. And these pitfalls stand in the way not only of landlords and tenants, but of every person in Scotland who seeks to avoid litigation by leaving differences to the decision of neutral men. One remedy is not far to seek. Where parties have agreed to have questions settled by arbitration, that agreement should be enforceable, and the Courts should be empowered to name the arbitrators or umpire where the parties fail to do so. That remedy already exists in England. There are also great facilities given by special statutes for settling railway compensations and similar claims by a simple method of arbitration; and these, with some revival, might advantageously be made of more general application. I have thought it right to refer to this subject in connection with the leading object of this address, because it is obvious that no system of agricultural compensation could be satisfactorily worked without a simpler and better system of arbitration than we at present possess in Scotland. This is far from being a farmers' question alone. Mercantile men, and indeed all classes of the community, are affected by it, and I cannot doubt that if you see fit to take any steps for the amendment of that Law of Arbitration you will find very general support in it.

Mr. D. CUNNINGHAME (Chapelton), the new president, then took the chair, and intimated that the first subject fixed for discussion was the land tenancy laws in relation to the question of compensation for unexhausted manures and permanent improvements.

Mr. GEORGE HOPE (Borlunds) said it was many years since he came to the conclusion that compensation to tenants for unexhausted manures was only a matter of simple justice when they were compelled to leave their holdings. He had no doubt that land might acquire increased value without tenants having done much for them from the making of roads, &c. But that was not what was referred to by tenants. It was when tenants limed their land, and filled it full of manures, the effects of which remained in the ground, that they should receive compensation. This was a thing in which not only farmers, but the whole country were interested. If they held their hand in applying manures to the land for three or four years, it would take double that time before they could get the farm into the full cropping state again. They would get neither the same quantity nor quality of grain for several years to come. They had got a custom in Lincolnshire which he would like to see made legal all over the country—the payment for unexhausted artificial manures, manures from extraneous feeding stuffs, and permanent improvements, such as drains. Some ten or fifteen years ago he had the pleasure of driving with the Hon. Nisbet Hamilton for a very long distance through the county of Lincolnshire, and he did not think that in from fifteen to twenty miles he saw a single acre under the average. All the land was in really good cultivation, and there was not a single farm indicating that the lease was coming to a close, as was not unfrequently, and perhaps not unjustly, seen in this country. He had held these opinions for many years; he had arrived at them when he was a tenant-farmer, and now that he was a landlord, he must say that it was of the greatest importance that the law should be changed.

Mr. RIDDELL (Hundalee, Jedburgh) said that the land tenancy laws should be considered as at least affecting the interests of two parties—viz., the owners and the occupiers of land, and any change contemplated ought to be with a view of benefiting the parties referred to, and through them conferring a boon on the nation at large. Although many landed proprietors reaped great advantage from the money invested by their tenants' skill, industry, and general good management, yet, on the other hand, it could not be denied that proprietors were often unfortunate in making choice of tenants, men who allowed houses, fences, roads, drains, and the land itself to fall into decay, vastly diminishing its letting value. He did not hesitate to say that any change they might contemplate in the land tenancy laws ought to provide by law for compensation to proprietors whose land might be deteriorated in consequence of bad management during a tenant's occupancy. Then, and not till then, could they as tenant-farmers with consistency go in for compensation for unexhausted improvements, permanent or otherwise. As the law stood at present, there was little inducement to farm well, as it was only those farms that were highly cultivated which induced and warranted a rise of rent; indeed, some of our largest and money-making farmers allowed their farms to run out several years before the expiry of the lease, and then went to the factor or landlord, telling him the farm won't grow certain descriptions of crops without

lime, and unless they got a renewal of the lease the loss must be considerable. Compensation at the end of a lease for all unexhausted manures, &c., would go far to prevent all this; and if compensation were given to the proprietors from tenants who had deteriorated the land during the currency of their leases, it would render it unnecessary for proprietors to trade on the enterprise, skill, industry, and capital of those farmers who had increased the letting or market value of their farms—a practice prevailing to a considerable extent at the present time. Indeed, such alteration of the land laws as referred to would naturally lead to a better understanding between landlord and tenant, and also to identity of interest, a want of which in too many cases was much to be deplored.

Mr. JOHN McCULLOCH (Glenhead, Stranraer) said that the great difficulty in securing reform of the present law with regard to unexhausted improvements was the outcry that the landlords would suffer. He thought it could easily be made plain that the landlords would benefit more than anybody else, the community next, and the tenant-farmers least of all, for even at the furthest they only wished a part of the money back which they had laid out. It had been said that there would be difficulty in carrying out any system of compensation, but he maintained that a schedule attached to the lease might meet the case, and if not, then legislation would become necessary. They should also approach the subject in a temperate spirit, and give compensation to landlords for deterioration, while they in turn gave compensation for unexhausted manures and improvements.

Mr. WM. SMITH (West Drums, Brechin) said that this question belonged to a group which had been so thoroughly ventilated, not only in the Chamber, but throughout the country, that not much new light could be thrown upon it. They were, however, indebted to their late president for much information and aid in the explication of the subject. All they asked was that farmers should be able to reap the unexhausted product of their own capital and industry if they were required to leave their farms. Lord Huntly and other noblemen and gentlemen, who were willing to aid them in this movement, deserved every support and encouragement from them.

Mr. GEORGE HOPE said he was perfectly satisfied that Mr. Macneel-Caird had not overstated the immense increase of land produce which would result from the granting of compensation to tenants for unexhausted manures and improvements.

On the motion of Mr. HOPE, the following resolution was adopted: "That this meeting cordially approves of the broad general principles expressed in Mr. Macneel-Caird's address in relation to compensation for unexhausted improvements by tenants on leaving their occupations, and its belief in the general benefit which would arise therefrom, as already expressed in previous resolutions of this Chamber."

The next subject for discussion was a remit from the Perth meeting as to the Marquis of Huntly's Land Tenancy Bill.

Mr. T. M. NICOLL (Littleton, Kircubbin) said it was within the knowledge of many of the members of the Chamber that Lord Huntly was at present engaged in recasting his bill, and he thought the discussion should be postponed till the meeting of the Chamber in April, when the complete bill would be before them.

The discussion was accordingly adjourned till April.

Mr. MACNEEL-CAIRD proposed that the Chamber should record its thanks to Mr. Vans Agnew, M.P., for his action in introducing his Hypothec Abolition Bill. There was a proviso in that bill which he (Mr. Macneel-Caird) thought, however, disfigured it, viz., the clause which provided that its operation should apply only to new contracts. If the bill were passed in that shape there would still remain the slur upon the credit of farmers under existing leases which arose from the present law, and, unfortunately, the evil would not be confined to them, because manure merchants and mercantile men generally could not be expected to find out whether leases were current at the time of the passing of the Act, and there would be in their minds a lurking possibility of the Law of Hypothec taking effect on all farmers for 19 years to come. There was not the least necessity for the clause, and he therefore thought that the Chamber should direct Mr. Vans Agnew's particular attention to that clause, and ask his reconsideration of it.

Captain BETHUNE (Blebo) thought it would endanger the success of the measure if the Chamber insisted on regard not

being had to existing leases. This clause had always been embraced in Mr. Carnegie's bill.

Mr. McCULLOCH thought success would be unworthy of the name if the bill was passed in its present form. He seconded Mr. Macneel-Caird's motion.

Mr. SMITH (West Drums) said that the bill would have enough to do to pass in its present form, and they should do nothing which was likely to lead to its being thrown out, as he imagined Mr. Caird's proposal would do.

It was agreed to divide Mr. Macneel-Caird's proposal into two separate motions—1. That the Chamber thank Mr. Vans Agnew for the efforts he had made to secure the abolition of the Law of Hypothec, and express the hope that he would continue them in the next session of Parliament. 2. That there are objections in principle to the proviso limiting the action of the bill to new contracts, and the Chamber request Mr. Vans Agnew to reconsider it. The first was carried *nem. con.*, and on a division as between the second and an amendment by Captain Bethune that the recommendation was uncalled for, the motion was carried by a majority of 22 to 8.

The annual dinner of the members of the Chamber took place in the Royal British Hotel, Mr. Cunningham (Chapelton, Ardrossan) in the chair; and Mr. Shepherd (Gleghornie) acted as croupier. Mr. Hope, of Borlands, gave "The Houses of Parliament." In the House of Commons the agriculturists only required to press those important questions which had in the earlier part of the day engaged their attention upon the House in order to secure their being successfully dealt with.

Mr. RIDDELL (Hundalee) proposed the "Scottish Chamber of Agriculture." He adverted briefly to the good results which were likely to follow from the discussions that took place among members of the Chamber, and showed how these were calculated to bring about the elucidation of the truth.

The CROUPIER gave "The Highland Society." It was because discussions such as those which occurred in the Chamber were without the pale of the Highland Society, that the Chamber had been first instituted.

A "ROYAL" REPORT.—The Bedford meeting is fully described in reports on the live-stock (very poor, as they generally are), and on the implements and implement trials (excellent as they invariably are). The reports of the live-stock class at our annual shows are very rarely well done. There are not many writers capable of describing cattle, or of criticising or commending in a discriminating way the awards of judges. And the editor of the *Journal* has not got hold apparently, this year at any rate, of the proper deputy. There certainly are writers who have this power, and our weekly agricultural papers, who secure their services, are better worth reading on this subject, in the very week of the show, than is the *Journal* of the Society, issued months after its occurrence.—*The Agricultural Gazette*.—The Bedford meeting is reported on at length. Mr. G. P. Smith occupies over one hundred pages with the implements, and appears to have acquitted himself most creditably. It is to be regretted that no one equally qualified has been employed to report upon the live-stock department. The excellent article, a year or two since, by Mr. Henry Corbet, might, we think with advantage, have been followed up, so that the leading features of each gathering might be placed on record. As it is, the reports of the different juries afford very meagre information.—*The Field*. [It should be added, in justice to the Editor of an otherwise so good number of the Society's *Journal*, that he must not be held answerable for this stock report, which was taken out of his hands.]

TESTIMONIAL TO MR. DENT DENT.—Soon after the defeat of Mr. Dent for Scarborough a subscription list was opened and a sum of money raised, which it was agreed should be embodied in a massive silver candelabrum. It was also resolved to present Mr. Dent with an address acknowledging his services, and expressive of the regret of the electors that his connection with the borough had been severed. A meeting of the subscribers was held in Scarborough, when the candelabrum was exhibited, and the address laid upon the table to receive the signatures of the subscribers.

TENANTS' IMPROVEMENTS.

At the meeting of the Inverness Farmers' Society, held in Inverness, Mr. Matthew Elliot in the chair, the following subject was discussed: What are tenants' improvements? and how can such improvements, as well as unexhausted manures, be estimated, so as to form a reasonable claim by a tenant at the termination of his lease?

Mr. MOLLISON, factor (Dochfour), said the subject, no doubt, was important; and he was sorry that he was only prepared to make a few remarks upon it. He had not written a paper, and indeed had hardly time to think over it with a view to the present discussion. It was a question surrounded with difficulty and complexity; but that was one reason for discussing it in a society of this kind. None but practical men were capable of discussing it properly. A good deal had been spoken and written about it during the last year or two, but chiefly by those who knew nothing at all on the subject; while those who did know, and might have thrown considerable light upon it, and assisted to clear away difficulties, had not opened their mouths. He was not aware of a single sentence having been spoken, in a sensible, practical way, for the exposition and settlement of this question. They knew, however, that the difficulty was not a myth. There were such things as tenants' improvements and unexhausted manures. Compare the country to-day with what it was fifty or twenty-five years ago. The change was very marked. They had finer fields and more of them, finer crops and more of them, finer stock, finer implements, better fences, better buildings; and undoubtedly the bulk of the improvements had been effected by the tenant-farmers of this country. The weight of part of it, perhaps, fell upon the proprietors—of erecting the buildings, for instance; but he was convinced that three-fourths, or at any rate one-half, had fallen upon the farmer. No wonder, then, the question had arisen, Are farmers not to be paid for this? The farmers thought they ought to be paid for it; mercantile men, who had generally a keen appreciation of value for value, agreed that they ought to be paid for it; and he thought even proprietors were bound to admit that, where a tenant had executed a solid, permanent improvement upon the subject he occupied, he ought to be paid for it. He did not believe any proprietor would dare to hold up his face and say otherwise. But then the difficulty arose, How were they to be paid? How were they to estimate a reasonable claim at the end of a lease? It was easy to arrive at this point but not so easy to proceed further. The best way, he thought, of treating the subject would be to suppose a good broad general case, such as might occur on any farm; and in the next place, to look at a similar case as it would appear under the legislation suggested for the farmer's protection. First, then, suppose that a good fair subject was let, but in bad order—the land wet, and fences and buildings insufficient. The landlord would make no improvements, but told the tenant to take it and make the most of it. The rent say was £150. The tenant, being a good, industrious, practical man, sets to fencing and draining the land; then the stock increases, and he requires better houses; and at the termination of his lease he finds that he has improved the place very much. He goes for a renewal of the lease to the proprietor, who says he likes him very well, and asks what rise of rent he will give? The tenant, who knows the subject very well, and does not want to quit the farm, but at the same time wishes to make a living out of it, offers. The offer is not accepted, and the farm is advertised. The new tenant gives £250 for it—an advance of 75 per cent.; and the old tenant says to the proprietor, "Surely you are not going to pocket all this handsome profit! Are you not going to pay me for the improvements? You know I was not bound to improve; and are you going to turn me off without making any allowance?" The proprietor agrees; and they propose to submit the thing to arbitration. But the lease is put in, as a matter of fairness, to allow the arbiters to understand the whole case. He observed Mr. Mundell listening very carefully. Would Mr. Mundell act as arbiter for the tenant?

Mr. MUNDSELL: Either for proprietor or tenant, so far as you have gone.

Mr. MOLLISON: Well, he would put the case of the proprietor meantime. Leave unexhausted manures for the pre-

sent out of the question. The arbiter for the proprietor says—"Look at the lease just as showing the position of affairs. You get the farm at a fair rent, value for what it was at the time, and no word of improvement. You made these improvements, and no doubt they must have paid you. The very fact of the farm letting at a rise of 75 per cent. is strong presumptive evidence that you were paid for them;" and the proprietor may say—"If I had known that you were going to make me pay, I would have expected a bigger rent." Of course, it was quite within the power of both parties to have arranged that the tenant was to make improvements, and to be paid for what was exhausted of them at the end of the lease. In the supposed case no such arrangement had been made; and now he should like to wait and hear what Mr. Mundell would have to urge on behalf of the tenant?

Mr. MUNDSELL said Mr. Mollison had made a really able and practical speech so far as it went, and he had little or nothing, to say in reply to it. It was an important question to ask How have the tenant farmers of Scotland come to farm their lands as they have done? These men had made all the arable land in the country what it was. For himself, he had improved a place on the west coast, and even put up stone dykes, for which he did not receive a penny of compensation. He admitted the improvements paid him, or he would not have made them: at the same time he had improved other people's property, and got nothing for it. If factors could manage to put a tenant in a place that needed improvement they could do it, but it was unfair that the tenant should have no recompense. Mr. Mollison had explained his own view of the case justly.

Mr. ROSS (Brecknish) thought Mr. Mollison's supposed case shirked the real difficulties of the question. He had selected a case which was, of all others, admitted the fairest for the tenant as the law at present stood. Where a lease of nineteen years had been allowed to reach its natural termination, the tenant certainly could not make out a very strong claim for compensation, as he would, if an ordinarily prudent man, have taken pretty good care to execute improvements which would repay him before the end of the lease. So far they could agree with Mr. Mollison, except in the case of buildings which the tenant might have found it necessary to erect shortly before the expiry of his lease, and these he should either be paid for or allowed to remove. But all tenants did not enjoy the protection of leases, nor did all leases come to their natural end. Suppose the lease was broken from ill-health, death, or bankruptcy, or that the tenant had sunk so much of his capital in improvements that he had not sufficient left to carry on with. Was it not a hardship, indeed really unjust, that the law should allow the landlord to step in and reap the benefit of those improvements, to the exclusion of the tenant or his representatives? It was for such cases, and for the vastly more important case of England, where few leases exist, that a change in the law was so urgently called for. Mr. Mollison had also avoided touching on what most people regarded as the greatest weakness of our lease system—namely, the practice of exhausting the land towards the end of the lease. So generally is this the case, that the supporters of these compensation measures say, a Scotch farm during a nineteen years lease is in good productive condition for only about half that time—the first five years being spent in raising its fertility, the next nine or ten in keeping it in that state and the remaining years in impoverishing it. Perhaps by employing artificial manures, an outgoing tenant need not leave very much capital in the shape of unexhausted manures, but surely this was a very serious loss to the nation at large. At the same time, he must confess that, looking at the great differences of opinion existing both among scientific and practical men as to the permanent qualities of manures, he was not very hopeful of a satisfactory settlement of the question being arrived at for many years to come.

Mr. ANDERSON (Lochduh) said that in his day he had been as great an improver of land as any tenant in the North of Scotland. He had improved upwards of 300 acres in a few years. He was not bound to take in all that land, but he drained and trenched it at his own expense, and he was quite well aware that the proprietor on the other hand was not bound to recompense him for his outlay. If he had made a bargain

he would have been paid for the improvements. It just came, to this, that they must abide by their bargains. Of course, if a tenant required to erect buildings, he should either be paid for them, or allowed to take them away. But if a man entered on improvements, he did so for his own benefit, and he required to keep his farm in good order the last year, otherwise he would not be paid such a price for his crop, &c. Let them go into their leases in a proper and right way, and let there be no row at the end of a lease between proprietor and tenant. Mr. Mollison had spoken about a reference to arbitration. That was a most difficult matter. A tenant must have seen with his own eyes that the land would pay him, otherwise he would not undertake improvements. In his case the farm was advertised over his head, and now another tenant occupied the and he reclaimed.

Mr. HENDRIE (Castleheather) thought that they should consider their leases well before they signed them. He had been as foolish as others—very glad to get hold of a farm in any way. And if any one came to ask him about this farm or that, he just said—"Don't be so blind as I was; consider well before you put your name to the lease." He had done a great deal to improve his farm, but he was thankful to say that he had a good landlord and factor, who encouraged him in it.

Mr. SCOTT (Parks of Inches) thought that tenants' improvements were easily described. Draining, fencing, building, in short, whatever added to the value of the soil, formed an improvement, and he thought it was simple enough for two practical men, near neighbours, to estimate the value of such improvements, as of everything else.

Baillie SIMPSON thought that at least a tenant who added to the farm buildings should get something for it at the close of the lease.

Mr. JAMES ARNOTT (Ness Bank) thought the only practical cure was a reduction of rents, as it is well known that, as a general rule, they were at present too high. Farmers could then afford to make improvements, and run the risk of getting compensation at the end of the lease. They could also afford to sell their stock on more reasonable terms.

Mr. MACKINTOSH (Scatraig) described the improvements he was himself carrying on, and observed that a man should give no more for his farm than he could see his way to clearing out of it. Offer for the farm either with a view to improvements or without such a view. Tenants, he observed, sometimes added to the buildings, but sometimes also allowed them to fall out of repair.

Mr. FRASER (Balloch) thought that a tenant, in taking a farm, was bound to consider whether any improvements he proposed to erect would pay him. As a rule, tenants in this part of the country had considered the subject, and had executed the improvements very much to their profit. His experience was, that it was not in the old-made farms tenants lived comfortably, but on farms where there was land to improve. In the memorable instance of the Fentonbarns, he was told that Mr. Hope not only improved the land, but actually covered acres and acres of it with new soil; and there was a man who made a fortune on farming. Again, it was the greatest mistake in the world to say that a man profited himself by exhausting the land at the end of his lease; it was in the closing years of his lease that he got paid for the work of all the previous years. But no doubt the practice of the country was to farm so as to exhaust the land towards the end of the lease, and this might tend to injure the produce of the country. There was no such difficulty as was alleged in estimating unexhausted manures. A certain quantity, say of farmyard manure or bonemeal, was put into the soil. It was quite well known that one crop did not exhaust them, and surely the amount still remaining could, for the following crops, be estimated by respectable neighbours.

Mr. MOLLISON shortly replied. He thought more might have been said on the tenants' view of the question, and he agreed that no farmer could farm well without leaving unexhausted manures in the soil. But, on the other hand, the tenant under his lease was bound to consume straw, and chaff, and turnips, and to return these to the land. Then the proprietor might ask why, in common sense and fairness, the tenant should ask to be repaid for them? Bones or bonemeal the tenant would apply in the early part or middle of his lease; but they were all chemists enough to know that they would not get the full return from these by applying them at the close of the lease. The tenant could apply

manures for the last two or three years that would leave precious little in the soil. As regards farmyard manure, his mouth was shut.

Mr. FRASER (Balloch): Is there not a difference between straw used with artificial food and straw used without artificial food?

Mr. MOLLISON thought artificial feeding made the manure more active, and the return was quicker. Turning to the question of proposed legislation, Mr. Mollison argued that many of the proposals would do more harm than good. One tenant might be for box-feeding, another for stall-feeding, another for irrigation; and if the proprietor was bound to pay for their "unexhausted improvements," the fear of losing money would not operate to the same extent as a check upon the tenant. He quoted a paragraph from a speech by Mr. Arkwright, M.P. for Derbyshire, who was in favour of giving compensation for unexhausted improvements, but "these improvements should be made with the consent of the landlord." What was this but throwing dust in people's eyes? Plainly the matter must come to be one of contract after all, the landlord saying, "I will not do the improvements myself, but I will pay you for doing them." This was the practical course and he held that tenants could execute improvements at one-third of what the proprietor could do.

The CHAIRMAN said that the majority of the speakers had been in favour of bargains with regard to improvements, and this was also his own view. The passing of a measure to make compensation for unexhausted improvements compulsory would give endless work to the law courts.

IRISH TENANT-RIGHT.

A Tenant-Right demonstration has been held in the Town Hall, Ballymoney, which was crowded to excess with tenant-farmers, Mr. Thomas McEldery in the chair.

The CHAIRMAN having referred to the importance of the land question and the gallant fight which the tenant-farmers made at the last election to return Mr. Wilson, who was certain to be returned at the next election, called upon Mr. S. C. McElroy to read an address to that gentleman.

Mr. McElroy having read the address, and Mr. WILSON having suitably acknowledged the compliment paid him,

Professor SMYTH, M.P. (county Londonderry), moved the first resolution, as follows:

That, four years' experience of the Land Act having proved its inadequacy in some respects, and especially for the revival and preservation of the Ulster custom, it is, where it has been impaired, desirable that an amendment bill be introduced, which shall not only legalise the custom, as granting to the tenant by prescriptive right and public equity a secure tenure and freedom of conduct in selling his interest, but provide facilities for amicable adjustment of rent at intervals in conformity with the principals and unrestricted operation of the custom.

Mr. JOHN MEGAN seconded the resolution, which was unanimously passed.

The following resolutions were subsequently adopted:

Second—That it is the duty of the Conservative Government, as the avowed protector of the rights of property, to introduce a bill calculated to preserve to the tenant-farmers of Ulster their just inheritance, and thus establish on a durable basis those social and agricultural relations, the existence of which is invariably conducive to civil peace and material prosperity.

Third—That, as the progress of the Tenant-Right cause depends on the farmers themselves, they should persevere with all zeal in their efforts to obtain a satisfactory settlement, and when opportunity arises to elect representatives pledged to advocate and support their interests in Parliament.

Fourth—That the thanks of this meeting are hereby given to the landlords who, before and after the passing of the Land Act, have upheld the Tenant-Right custom upon their estates, and to such landlords in Antrim we express our special obligations.

Fifth—That the 3rd, 4th, and 7th sections of the Land Act having granted to the tenantry of the south and west of Ireland two important elements of the Ulster custom, it appears to this meeting that the right of voluntary sale of the property granted by those sections should be conceded by the Legislature, and such provisions made as would give them full security against capricious eviction and rack-renting, thus extending to them the benefit of the Ulster custom in its essence and practice.

"MR. THOMPSON, OF KIRBY HALL."

The journals and records of the Royal Agricultural Society of England would indeed be incomplete without some sufficient memoir of the late Sir Harry Stephen Meysey Thompson, better known to the agricultural world as Mr. Thompson, of Kirby Hall, in Yorkshire.

A certain coldness of manner and seeming chill reserve appeared to dull the warmth of a tender heart and a disposition not disinclined to a sense of genial humour. Nay, even some, who little knew the man, misconstrued unobtrusive modesty, and fancied that they detected a savour of haughtiness. There must have been rare qualities of mind to enable him, notwithstanding marked drawbacks of manner, to achieve, as a practical man of business, a singular success. Of the two great English Agricultural Societies he was a ruling spirit. Under his guidance the North-Eastern Railway Company became one of the greatest and most successful of commercial undertakings; and, moreover, he founded and guided the ever-extending United Companies Railway Association. Mr. Thompson's is a fine example of an honourable and unselfish ambition, by unsparing energy overcoming such drawbacks as natural shyness and reserve, and, perhaps, an invincible tendency towards exceeding minuteness. With tact to guide, with gentle wisdom to draw, and with sufficient power of expression to give effect to both, he was a patient man, of clear perception that went straight to his point; passionately fond of work—overwork—he delighted in setting wrong to rights, and establishing order where he found utter confusion. Always ready to help others to bear their burdens, he kept many irons in the fire, and yet allowed none to cool. A careful gleaner of opinion, consequently a good listener, he was never in a fuss or hurry, nor irritable nor boastful. The key to the knowledge of others was in his hands, for in early life he knew himself and recognised the essentially practical bent of his own talent. And "passing show," which he detested, he had above all things an ever-abiding sense of over-ruling Providence. Let Mr. Thompson's exact position be understood at the outset. He gained honours at college, but was never a literary man. He made a dive into the ocean of science, and brought up one scientific pearl of great price, of which more hereafter, but he was never a man of science. Science and literature he regarded but only as they conduced to his practical objects. In agriculture his position was between the professor of science and the man of practice—he stood midway—a beneficent interpreter. "The first attempts of the farmer and philosopher to run in couples were not encouraging" (these are Mr. Thompson's own words); "they conversed in unknown tongues." Heir to a fine estate, Harry Stephen Thompson was born at Newby Park, in Yorkshire, on the 11th of August, 1809. A clever, shy child, apt for work, he could read and sum at three, and knew something of Latin grammar at five. Being a delicate boy, his father sensibly thought that the absorption of knowledge was better than the now fashionable cram, so on his pony the boy trotted down every day to the parsonage, his pockets as well as his memory bulging with the familiar Virgil and Horace—never forgetting, however, to visit by the way and to fro a certain stock-yard, where he kept rat-traps constantly going; and a neighbouring barn-wall told of his characteristic energy, for it did many a tale unfold. As a boy, and through life, he was a fine shot and fond of shooting. When eighteen he was sent to a private tutor near London, to prepare for the university; and during two years he made so much progress that, in regard to an academical career, great

expectations were raised. He entered at Trinity College, Cambridge, in 1829, at the age of twenty, and found time for entomological study under Darwin; but the allurements of society and the attractions of the tennis-court were, as concerned studies, sad disturbing influences. He graduated, nevertheless, in honours in 1832—senior optime in the mathematical tripos.

Before settling down at Kirby, and, according to his father's wishes, entering upon the rural life of an English country gentleman, the young Thompson travelled on the Continent and in Scotland, and spent a summer in the South of France to perfect himself in French. In his foreign correspondence we pass over much *naïve* description, and not a little sunny humour. He says we can live in Holland for £10 a month, and buy there a good-looking riding-horse for £9 or £12. He swam across the Rhine where it was a quarter of a mile broad, the current carrying him down three-quarters of a mile; the time fifteen minutes. At Rome he had fever, and, with his horse, a bad fall. From Toulouse, in 1834, he writes that there is much agreeable society; as it is one of the retreats of the *ancienne noblesse*. He is working hard at French: all sorts of game abound, and he asks for his English gun. He was introduced to a great French agriculturist, Baron Malaret—a practical man. The shrewd old fellow keeps exact accounts; credits his working bullocks with their hours of work, and charges them for their food. The Baron is an example of what improved agriculture may do in France: chiefly by introducing the English system, he has tripled the value of the family estate. But Mr. Thompson says, "there is no fear of my becoming restless and unable to settle down to my duties as a future English country gentleman; the more I know of foreign manners and institutions, the more I appreciate home: there is no place like home."

The Yorkshire Agricultural Society—the legitimate offspring of the Society of Scotch Improvers, 1723, and of the Highland and Agricultural Society—was born in 1837, the first year of the happy reign of the Queen. The circumstances attending the birth of the Society are thus recorded by one who was then present. A country house party assembled at Kilwick-Percy, at that time the home of the late Mr. Denison; after dinner, Mr. Thompson remarked in reference to the subject of conversation—some local cattle shows, "Don't you think we could form a Yorkshire Agricultural Society movable from place to place throughout the county?" The next morning a small meeting was held at Pocklington—Thompson rapidly and clearly sketched a scheme—he obtained the aid of Lord Spencer and of others; the thing was done. Curiously it was at first contended that tenant farmers and farming landlords could never compete on equal terms. Thompson vigorously opposed this narrow view, and there was no restriction. The leadership of this important and most flourishing Society was virtually in Mr. Thompson's hands, until the year 1870, when the pressure of other work, and perhaps failing health, to the regret of all, led to his virtual retirement. We should here refer to that which all his friends will recognise as very characteristic. Mr. Thompson had an agreeable theory that "all truly British Institutions commence with a dinner," which sociable theory he much delighted to extend and to carry into practice both at Kirby and at his town house in Mansfield-street. His hospitalities—and he was truly hospitable—he liked to make conducive to his practical views.

The Royal Agricultural Society of England was founded

in 1835. Two eminent men, now no more, have in a remarkable degree influenced the fortunes of this national society—Mr. Pusey and Mr. Thompson. The agricultural life of both these distinguished men may find a fitting monument in its journals. Mr. Pusey edited the *Journal* from the first, and until his lamented and premature decease in 1855, when its conduct was confided to Mr. Thompson, who more or less is responsible for its management for a like period of seventeen busy years. A man of high character and sober judgment, Mr. Pusey was at once a philosopher and a man of business; a man in advance of his age. Practice with science, the motto of the Society, his characteristic and oft-repeated words, even he thought more desirable than profitable. If to the unreflecting these two pregnant words appear trite, the pondering student sees in them the key to the agriculture of all future time. It is fit, it is essential to draw some parallel, to suggest some contrast between men so united in kindred labours in the same cause, so distinguished in the same agricultural field of action. Indeed, in 1854, Mr. Thompson in his "Essay on Progress," virtually invites some such comparison. Mr. Pusey and Mr. Thompson were in no sense rivals: they were altogether complementary the one to the other. When the dying man relinquished the lamp of agricultural progress to the hands of another, it was with the full assurance that it would be safely and rapidly carried forward on the path that he himself had indicated from the first and carefully mapped. Pusey was a natural leader of men, endowed by nature with that indescribable essence called genius. Thompson, on the other hand, was a man of highly cultivated talent. What the one grasped by flash of instinct, the other followed patiently and laboriously with true British pluck and painstaking. Pusey boldly led the way by the force of dominating character; irresistibly Thompson pushed men on by the gentle and modest suggestion of superior knowledge of every subject and question in issue. Mr. Thompson was essentially a practical man. The good seed practically sown by those good husbandmen, Sir John Sinclair, Arthur Young, and others, bore good fruit in the shape of practical agricultural tours undertaken by Mr. Thompson, accompanied by Denison, afterwards Speaker, and subsequently Lord Ossington, Mr. Lawes, and others. Most of the farms worth seeing in Great Britain were visited, and much valuable information gained. At this time also, the writings of Baron Liebig directed attention to the practical application of chemical science; Mr. Thompson's thoughts turned towards the chemistry of agriculture.

In an ancient corner of the ancient city of York, where old beetle-browed houses with quaint carved beams overhang the narrow foot-pavement, there lived, in the summer of 1845, a chemist and druggist of capacity, a shy and retiring, but able and exact member of the Society of Friends—his seal a pestle and mortar, underneath the letters J. S.—Joseph Spence. He was also managing partner in the York glass-works. The Thompsons of Kirby were old customers. Spence knew nothing of agriculture but what young Thompson told him; and often he came to and fro. An agricultural laboratory was fitted up-stairs. Thompson suggested, amongst others, an experiment—the power of the soil to absorb and assimilate ammonia. A glass tube to be afterwards filled was made at the glass-works: it represented down to the drain a four-foot section of earth. Spence, much interested, worked early and late: he ground down turf to fill the tube. The result of the percolation of a solution of ammonia fairly startled them all: it was not filtration, but a new chemical action. Spence threw up his hands in astonishment, and called up Holden his assistant to see the unexpected result. Friend Spence! did it at that moment occur to thy practical mind that

mere money might be made of this discovery? No, not in the coin of this work-a-day world, but it is most negotiable in the universe of science. The eleventh volume of the *Journal* contains Mr. Thompson's modest account of his discovery: the paper is a model of lucid exposition. The guiding idea flashed upon him when observing the escape from manure heaps of quantities of ammonia. In the words, specially addressed to us, of a great living authority, "It is remarkable that this slight experiment contains the germ of what I should consider to be one of the most important, if not the most important of all the scientific investigations connected with the practice of agriculture." Mr. Pusey, President for the second time, was prevented from taking his place at Lincoln. The sixteenth volume of the *Journal* for the year 1855 contains the record of his early and lamented death at the age of fifty-four years; and so ends what we may venture to call the Pusey period of the Royal Agricultural Society. The *Journal* of the Society was now conducted by Mr. Thompson. The new editor added half-yearly valuable statistical tables. The Report to the Council contains the suggestive phrase, "international agriculture." In the next year, 1857, there is a curious reference to American public judging in the ring, to "prevent favouritism." There appeared in 1864 Mr. Thompson's exhaustive paper on the "Progress of the Royal Agricultural Society." If reprinted, this might well be entitled an *Agricultural Handy-book*. As president of the Society, the presidential address delivered by Mr. Thompson at the end of year 1866 comes as a fine close to the history of his long literary career in connection with the agriculture of England, as represented by the Royal Agricultural Society. He taught the lesson of his life—Press on!

As with agriculture, so with railways: in the one case there were old prejudices to be fought, old customs to be uprooted; so in the other there was culpable mismanagement, if not fraud; there was wrong to be righted, there was confusion to be reduced to order, and therefore, with characteristic energy and moral courage, Mr. Thompson, being a practical man, advanced to a practical attack. It is always the case, the cruel demon of greedy speculation was devouring indiscriminately the substance of the innocent and of the guilty—unworldly clergymen, widows and orphans, were sufferers as well as the mixed mob of gamblers—the dirty, the fashionable, and the vulgar. He moved the resolution which removed the late Mr. Hudson from office; the immediate object being to rescue the property of the shareholders by introducing sound and honest management, and by restoring to rival companies the blessings of peace. This labour at first was well described to us as "night and day work!" Mr. Thompson was not actuated by any motives of self-interest. Owing to his mistrust and by his instigation the greater part of the family interest had been removed from the suspected undertakings. As chairman of the North Eastern Railway Company, Mr. Thompson saw the good seed he had sown bring forth good fruit most abundantly: that which he undertook to lift from its state of abject desolation, became under his hands one of the most highly appreciated and greatest of English commercial undertakings. He proposed and organised, in 1852, a Railway Companies Association, of which he was chairman; but after several years it was torn asunder by the battle of the gauges and long territorial contests. A second attempt, however, which, like all truly British institutions, commenced with the characteristic dinner, was more successful, and has not only introduced moderate and give-and-take feeling between the companies, but also between the companies and the great public it is their interest to serve. He continued until almost the last to be chairman of this association. Suffice it here further

to say that when the railway history of Great Britain shall be written, the railway-direction career of Mr. Thompson may well fill many an instructive page, and every line will convey the impression of a policy pre-eminently successful, because it was thoroughly honest, and admirably straightforward. The political career, so much desired in early life, came, but it came late: at the age of 50, in the year 1859, Mr. Thompson entered Parliament as Member for Whitby. Seven years afterwards he lost his seat in consequence of a dramatic but unfortunate circumstance, for which in no way whatever was he responsible—during the election contest, his opponent, Mr. George Hudson, was arrested by his creditors. The originator of improvement schemes, the founder of the water works, Mr. Thompson did much to encourage art in the jet trade, and he will long be remembered at Whitby as a public benefactor. At the next election, in 1865, he was brought forward for the Eastern Division of the West Riding of Yorkshire; after a severe contest he was defeated by a narrow majority. The Parliamentary position Mr. Thompson speedily gained has been estimated and summed up by two thoroughly qualified political friends, to whom we are specially indebted. By no means an ardent politician, the cool administration of Lord Palmerston was not calculated to add fuel to any political fire that may have smouldered. On agricultural and railway subjects Mr. Thompson, from his conspicuous knowledge and accuracy, was soon recognised as an authority. As a speaker, with a mastery of detail, he was always clear and definite: he never attempted oratorical flights—his was a thoroughly House of Commons style, full, ready, and conversationally flowing. If in early life his inclinations had not been diverted, had he entered Parliament whilst yet his dispositions and habits were plastic, he would, no doubt, have risen high in the Government of the country. Coldness and reserve of manner were serious drawbacks in electioneering, more than compensated, however, by the good sense and tact which often induced compliance, and never failed to command respect.

“Home! there is no place like home.” We have followed Mr. Thompson from boyhood to youth; we have traced with care the more important highways of his public life; it remains for us just to indicate the lesser paths of duty, which he trod with so much benefit to his family, his neighbours, and the public, and it is as pleasant as it is essential to the completeness of our biographical sketch, to conclude with a rapid glance at the home life at Kirby. We have seen that the two great agricultural societies were founded in the years 1837-8; two years afterwards Mr. Thompson established his home farm, and devoted much time, and his surplus income, in extending the use of machinery, and in otherwise improving agriculture, and in promoting education, as well upon his own estate as in the management of the diocesan training-colleges of York and Ripon—and this at a time when those educational institutions had few supporters and scanty means. Afterwards middle-class education interested him; and during many busy years he found time on Sundays to visit his farm to teach the farm-lads. We may not do more than refer to his happy marriage in 1843, and to the numerous and promising family by which he was subsequently blessed. Charity, melting charity, claimed from his busy life many a well-spent hour. From 1845, for 20 years he acted as chairman of the House Committee of that admirable institution, the York County Hospital, and during his chairmanship the new hospital was built. The railway directorship, as we have seen, commenced in 1849. He succeeded at his father's death to the family estates in 1853; and six years afterwards Parliamentary business for a time somewhat interrupted

home duties. Early in life an acting justice of the North and East Riding of Yorkshire, in 1865 he served the office of High Sheriff of that great county; and, as we know, in 1867 he was President of the Royal Agricultural Society. We fancy we gather in Mr. Thompson's writings much that is autobiographical—he sketches a man so hungering for knowledge, that he is never satisfied until he could ascertain all the causes of failure. “The management of an imaginary farm” savours greatly of his own experience. Mr. Robson, hale and hearty, his bailiff from the very first, is still at Kirby to speak much of his late master and little of himself: he can tell of the exceeding minuteness that regarded every minute detail of the estate, of the household, and of the farm—no turnip sown, no sheep bought without his master's knowledge. As a landerl, Mr. Thompson is autobiographical when he says, “there exist personal ties which, if rudely severed, would be most inadequately replaced by additional rent.” Safe tenants may crop as they please—simplify agreements, and regard good stocking and thorough manuring. Give plenty of notice; so combine freedom for the incoming with justice to the outgoing tenant. Routine, he adds, cannot be broken through without a pang, which never, however, survives a favourable balance-sheet. In the somewhat flat country of the Vale of Ouse Kirby Hall is pleasantly situated, exactly in the centre of a circle of park and other lands, which have been cultivated and improved by Mr. Thompson. The garden-front commands a distant view of the grey towers of York Minster. To the north you may see wonderfully-improved park land—in June yellow with the buttercup. At no great distance, embowered in trees, there is the ancient parish church. Westward, following the home circle of cultivation, the new approach, crossing a serpentine lake, leads through a grass-field, on deep hazel loam, to the Kirby home-farm. Beginning with 250 acres, this home-farm in 1867 had grown to 670 acres, of which 300 acres was grass. At first he maintained a pure herd of Shorthorns, but this was sold in 1848; he always, however, had a well-bred bull. The sheep, of the Leicester breed, were also carefully selected. There is here a characteristic of the Kirby estate—a covered foldyard. In every direction may be traced the hand of the improver—he was no mere paper farmer—drainage, which he thoroughly understood, marling, enlarged fields. Towards the south point on the home circle of cultivation there is the new home-farm of 340 acres with its covered foldyard. Many of the buildings, with corrugated tiles, are only just finished. Some land here is poor clay, much cracked; two large fields have been recently laid down to permanent grass: thanks to artificial manure, the ground is pretty well covered, and there is clover. Still the general impression is, that on this bad land the good grasses say to the farmer, “Wait a bit.” There is close by an old pasture, of which its late improver was very proud—a triumph of skill in old grass cultivation. Previously the quaint old tenant of this “deafish” field used to say: “The grass came a week afore Barnaby fair!—June 22nd—and went a week after!” Difficulty has been experienced in getting good grass-seed—some has been lately got from the hay crop of Wensley Dale, some from the neighbourhood of Knaresborough. Circling eastwards, and entering the park from the east, there is a fine field of grass, laid down thirty years ago; thirty-two Irish cattle bought in May were in June feeding here, and many cribs about told of other food than grass. Passing by experimental grass-plots, interesting only as showing the interest to the last which the careful experimenter took in his latest practical study, we regain the front park—our point of original departure—to admire, beneath the well-cared-for plantations, 40 fat bullocks, as sleek, fat, and restful as a rich pasture and rich artificial food could possibly make

them. Stay—to complete our landscape we want a foreground figure. It is more than imagination that enables us to dash him in—an ancient tenant and neighbour—he will tell us that Sir Harry was respected and influential elsewhere; but, in addition, around Kirby Hall he was much and generally beloved. Health failed—gradually, very gradually. A sojourn in the South of France. A welcome return to Kirby. More illness, and, as before, tended with domestic devotion. Honours came. The Queen, by the hand of her Minister, conferred an

hereditary distinction. Commercial gratitude was shown in the shape of a magnificent testimonial. Political addresses gratefully acknowledged. But as he stood on its brink, and looked steadily into the black gulf—probably next to a mental onlook—an humble onlook—towards the promised land—he found comfort in the doubting retrospect of 65 years of a busy, a well-spent, and an unselfish life, which, on the 17th May, 1874, death came to close in peace.—From *Lord Cathcart's admirable Paper in the Royal Agricultural Society's Journal.*

MAIDSTONE FARMERS' CLUB.

INDIGESTION IN THE HORSE.

At a meeting, at the Star Hotel, Maidstone, on Thursday, Professor Pritchard, V.S., was announced to deliver an address on "Indigestion in horses, and the effect of the change upon their system on passing from dry to green food;" Mr. T. B. Lovett, president of the Club, in the chair, Mr. R. Waterman the vice-chairman.

Mr. PRITCHARD said he thought it would be well first of all to make a few general remarks about the digestive process, and to describe the change which food undergoes from its reception in the mouth of the animal, and its passage through the intestines, and to point out the difference between digestion and indigestion. Indigestion, as popularly received and understood, arises from some irregularity in the action of the stomach, some defect in that organ or the walls of that organ, or in the secretions and their actions upon the contents of the stomach. But if they were to look at the subject narrowly it would be found that indigestion might be produced in some other way than from these causes. To begin with the mouth, they would find that the food when taken into the mouth was masticated by means of the teeth, and mixed into saliva or spittle. This was a very important point. The food had to be crushed, and unless the teeth were in a condition to enable them to crush the food properly, and the glands were in a healthy condition, neither mastication nor salivation could properly take place, and if the food passed into the stomach in a crude state the digestive process could not go on properly. This showed the necessity of the teeth being in a sound condition. It was not generally known that the saliva bears a very important part in the digestive process; it mixes with and softens the food, and thus renders it easier to be crushed. The taste of the food is also affected by it, and it has also a chemical action upon the food. Some animals could swallow their food without hardly any mastication. A dog, for instance, could take its food and swallow it without any chemical change taking place in the food at all. The food having been crushed and softened down in the way described, it was made into a pellet, it was conveyed down the throat, and by the gullet into the stomach. Having got to the stomach, when the stomach becomes full, another process of digestion goes on. The stomach in the horse was very small in comparison to the size of the animal—not more than a sixth part of the size of the stomach of an ox. It would not have done for the horse to have had a large stomach, for he has to travel long distances, and if he had a large cavity like an ox, it would occasion very great inconvenience to him. The stomach has two coats—one a muscular coat and the other the mucous membrane. It was necessary that the food, when inside the stomach, should be well salivated by the secretions, and unless the food was moved about, it could not be properly saturated with the secretions or the gastric juice. If they were to place their ear on the left side of the ox when the first portion of the stomach was distended with food, they would hear this mixing of the food going on by means of the contraction of the muscular membrane. There was only one other animal that he was aware of that had a stomach like this, and that was a rat. The function, then, of the stomach was that of thoroughly mixing the food with the secretions of the living membrane, and it does this by means of the muscular action of the membrane coat. Within this portion of the digestive organs they have the softening process and the dissolving of the food by the chemical action of the gastric juice. Having undergone this process, it is not even

then in a fit state to be absorbed, for it has to pass again into the intestinal canal, where it receives other fluid secretions from the liver, pancreas, &c. So that other organs, besides the stomach, if they are in an unhealthy state, have the tendency to produce indigestion. The food, which when in the stomach is called chyme, passes from thence into the intestinal canal. This in the horse is remarkably long, compared with that of flesh-eating animals. The food which they eat contains, comparatively speaking, a small amount of nourishment, and requires a longer time for the nourishment which it contains to be abstracted. This is a reason for the intestines in a horse to be longer than in flesh-eating animals. The length of the intestines in a horse is about 9 ft., and an important change in the first portion of the intestine takes place before it passes the food into the first portion of the gut. It meets here a secretion called bile, and another secretion called pancreas, and by the action of these two secretions the chyme is converted into chyle. The liver of the horse is without a gall-bladder, and in this it differs from most other mammalia. Having been subject to the action of these fluids, the food afterwards passes into the form of feces. The extraordinary length of the small intestinal canal, which is 6ft. in length, is for the purpose of allowing it to roll about the abdomen and shake together, like the contents of a barrel when rolled down a hill, the fluids and solids which it contains, and thoroughly mix up and absorb the contents before they are passed into the large intestines. After passing the small portion of the intestines the remainder of the contents pass into the large intestines; it is there mixed with a portion of the fluid, which washes out what food remains for absorption before it finally passes away. Such is the manner in which healthy digestive action is carried on. Were he asked what indigestion means, he should reply that it not only meant irregularity of stomach, but any irregularity in any portion of the digestive system. He proposed to speak of indigestion under two heads—the first chronic, or of long standing, and acute indigestion, which may take place in a few minutes, and terminate in a very short time. He would take the acute form first. There were several causes which would give rise to this. First there was overloading of the stomach, and taking a quantity of what was known as indigestible food. From these two causes they had acute indigestion of two very different kinds. Suppose an animal gets to a quantity of wheat. This being a kind of food which the animal had not the opportunity of eating, he relishes it, and eats a large quantity, and thus overloads the stomach. This food having got into the stomach, and been mixed with the fluid there secreted, the food swells, and distends the stomach so that the muscular coat becomes absolutely useless, and its actions wholly or partially paralysed. Suppose a horse takes a large quantity of this kind, so that he is unable to mix the contents of the stomach properly, a small portion only of those contents is acted upon by the gastric juice. There is, as they knew, a great and intimate connection between the stomach and the brain. After eating a hearty dinner and drinking wine, a man feels inclined to sleep; this was because of the connection between the stomach and the brain. When the stomach of a horse becomes distended in the way he had spoken of, the animal appears unusually dull, and as the symptoms advance, he walks to the manger, or any other convenient place, and rests his head. The pulse, instead of being from 32 to 36 falls to 28, and even in some cases to 24 or 20; the eyes immediately become glassy, and the

pupillary opening becomes elongated instead of circular, this showing that the brain is being affected. If they put him to walk, the poor animal will stagger and seem to fall. These are some of the symptoms of acute indigestion. The brain to some persons seems to be affected, but the animal is really suffering from an attack of acute indigestion. There was another cause. Suppose an animal is taken from a stable, where he has been fed on hay and corn, and gets a large amount of green food, probably clover. From this he may get acute indigestion. When the food gets into the stomach in this way, fermentation sets in, gases escape, and the stomach becomes distended. But the symptoms are different to those in the other case. Instead of the animal being dull, sleepy, and careless, he feels a considerable amount of pain, not perhaps acute pain, as they see in ordinary gripes and colic, he rolls on the ground, kicks about, turns round and round, and his pulse, instead of being at 32 or 36, or as in the other case, as low as 20, runs up to 55 or 60, and as the malady increases even to a greater figure than this; the external surface of the skin shines, the flanks are distended. This arises from eating various kinds of food, such as mouldy hay, or hay badly got, or coarse dry clover, or oats covered with mould, bad oats, or kiln-dried oats—from any of these causes they might expect this form of acute indigestion. If horses are kept without water for a long time and then given a large quantity, this will also produce it as well as irregularity of feeding. In the first form—that wherein the horse suffers from cerebral symptoms—unless relief soon takes place, a different appearance altogether comes on, and if there is no change in from six to twelve hours, he becomes affected with what is called mad staggers. He paws the ground, and runs on to show all the symptoms of inflammation of the membranes of the brain or of the brain itself. The eyes are wild, and the horse kicks about: he runs his head against the wall, he kicks out violently, and knocks himself about as if he did not care what became of himself, and unless soon relieved the horse will die. In the other case the evil will continue until the walls of the stomach burst by the accumulation of gas, and so the horse dies. By vomiting a dog may get rid of the contents of his stomach, but it is very seldom that a horse can be got to vomit. Something must be got into his stomach which may operate on its contents, and make them pass in the usual manner. When a horse becomes affected as he had been describing, what should be done? In the case of stomach staggers, or the walls of the stomach being paralysed, he would recommend the use of strong stimulants, such as aromatic ammonia, with spirits of ether or ordinary spirits. He should also give a purgative and something to rouse the nervous system and to irritate the membrane, so as to stir up the secretions and enable the contents of the stomach to pass into the intestinal canal. When the stomach is in this distended state, if the horse were to fall down he would be liable to be ruptured, and rather than let a horse roll or stumble about when in this condition, he would even place him in slings. In all cases affecting the stomach and bowels they could not do better than keep the horse moving about on his legs, in order to prevent his injuring himself. In the other case, that of the presence of gaseous material in the stomach, it was difficult to deal with, and unless they could get rid of it medicine was of no use. To get rid of the carbonic acid gas they should pour into the stomach such agents as would change it into solid matter. Aromatic spirit of ammonia was one of the best things which could be used for this purpose, and hartshorn was very good, and so was also, in a solid form, carbonate of ammonia. This given in small and diluted doses, will gradually bring about the breaking up or the decomposition of the gaseous material; they can then drive it out of the stomach into the bowels, and so get rid of it. In the other case—the chronic form—the evil may go on for a considerable period, and the changes brought about may be very slow in their progress. Suppose a horse in the stable or out at grass is seen not to thrive, notwithstanding any amount of food is given to him. If they examine the coat, they will find it presents an unhealthy appearance, and the horse, as it is said, “stares” in his coat. The appetite is uncertain; he feeds well for a time, and then falls off; he becomes voracious, and eats any quantity of food, but without taking any notice of the quality. He will eat mouldy hay, or even his bedding sometimes. He had known horses, when in this condition, eat soiled and stained bedding, and even actually eat their own feces, just after eating a good quantity of proper food from a

manger. He knew a case where a horse ate plaster, and when out at grass horses had been known to eat loam or sand. The skin appears hidebound at such times, instead of being easily and readily moved about, as is the case at ordinary times. The action of the bowels is irregular, and the horse is often supposed to have worms. The cause of chronic indigestion may be from some defect in the mouth, or in the glands which supply the spittle; it may arise from some defect in the stomach, from want of power to contract and perform its functions, from an impaired condition of the liver, or the pancreas, or any portion of the lining of the intestinal canal. Suppose a horse has anything the matter with his teeth, and can only partially masticate his food. In this case a healthy chyle cannot be obtained, and all the symptoms of chronic indigestion are shown. In such cases, they might ask what chances are there of the horse's recovery? He should say this depends in a very great degree upon the length of time the animal has been suffering. If it has come on recently, he should change the quality of the food, giving a diet small in quantity, but containing a large amount of nutriment. He should give, first, a purgative to get rid of the material in the stomach, and then he should feed the horse on a good stimulating diet. He would not treat him so as to give rise to debility, for the horse would have become very debilitated, and they should avoid doing anything to increase that debility. Passing suddenly from dry to green food, affects horses in this way very much. Suppose if they were to make a change to grass, after the horse had been standing some time in the stable. If the grass were of such a kind as to afford a fair amount of nourishment, if it has been properly collected, and has not undergone fermentation, and does not produce over-distension of the stomach, the change would be of a very beneficial character; variety of food was beneficial to all animals. If they were to feed an animal in good condition upon grass, it would afford rest to him from his usual hard labour. When horses are kept for hunting or racing purposes, they must be fed on food which contains a large amount of nourishment, such as oats, peas, or beans. They had a larger amount of work to do than animals fed on less nutritious kinds of food, and if a horse was fed properly in his stable and his food regulated nicely, giving him a grass rest would bring about a change which sometimes would have a very beneficial effect. But care must be taken that the utmost regularity is practised, or very bad results may be brought about by the change. If, however, a horse is put into pasture which does not grow grass, or is fed on clover which has run to seed and has been a long time growing, they might expect indigestion, both acute and chronic. When a horse was turned out to grass too much care and judgment could not be used. If a horse had passed the first eight or nine years of his life in a stable, it would not, in his opinion, do much good out at grass; he might thrive for a time by the change, but his condition would be so reversed, and his digestive system would undergo such an utter change, that it could not be of benefit. Instead of having a small portion of nutritious food, without any trouble to obtain it, he has to walk over a large space before he can get food sufficient to afford a proper amount of nutrition. It would be like, as had been observed, taking a City alderman who had been accustomed to live on turtle and other light food, and putting him to live on workhouse diet. Then, also, the kind of pasture into which the horse was put had to be considered. If he had been accustomed to be turned out for a portion of the year, he should not be turned out where there was a small amount of grass, or where the grass was quickly grown. This last condition had a great deal to do with the matter. In Northumberland and Cumberland it was the custom to feed horses partially in the stables and turn them out to grass at night. But the grass in the northern part of the Kingdom was slow in growth, and contains a large amount of nourishment. Horses thrive generally when out at grass, and there were cases where it was advisable to turn them out. For instance, where horses had a sand-crack, turning them out to grass rests them and gives them time to recover. If they were to place such a horse in a nice soft pasture where there would be the opportunity of gentle exercise for the foot, it would be much better than keeping him in the stable, where, by the hardness of the place on which he stands, the action of the foot might cause the crack to open again. The horn growth was also increased by the action of the moisture from the pasture. Suppose, again, a horse had met with an injury whereby he had lost some muscle, gentle

exercise would bring it back again, and this would be best promoted by turning the horse out to grass. The Professor concluded by stating that he had had lately a severe attack of neuralgia, from which he was still suffering, and had he consulted his own convenience only he should not have appeared before them that evening. He expressed his desire to answer any questions that might be asked, and should be pleased to visit at another time the Farmers' Club at Maidstone.

The CHAIRMAN asked the Professor what food he would recommend for cart horses, to prevent the indigestion of which he had been speaking?

Mr. EDMETT asked if a horse which had been in the stable a long time, and been used to dry food, was turned out to grass, would not a little dry food given with the grass food be beneficial to him? He also asked if the use of the nosebag, and the dust getting through it into the lungs, would not be likely to cause indigestion?

Mr. BURKETT said he had been in the habit every summer of turning out his horses to grass for four or five months, and gave them also the usual amount of corn and other dry food which they had had when they were in the stable. The horses were turned out at the latter part of the day, when they had done their work. He should like to know whether his plan was advantageous or not.

Mr. WATERMAN said that some farmers were in the habit of turning out their horses for work at six o'clock in the morning, and working them till eight o'clock; then they had a rest and some food, and were afterwards kept on to work till 12, when they had another rest and a feed, and were turned out again to work in the afternoon. Others turned their horses out at six o'clock, and kept them working till two, a period of eight hours. Which plan did the Professor consider the best—doing the whole of the work to be done without rest, or letting the horses do it at two or three different times, as described?

Professor PRITCHARD, in reply, said the feeding of cart horses very much depends upon the quality and kind of work which the horses were called upon to do. Horses employed in iron work and in coal pits have more laborious work than in agricultural districts, and the kind of food which should be given depends upon the nature of the work which they have to perform. He was an advocate for cutting up hay for agricultural horses, instead of their eating the hay from a rack—of giving them as feed-stuff chaff mixed with corn, rather than hay and corn, also of mixing with their food a quantity of bran. Horses were in the habit of getting constipated bowels, and pains arising from colic, and to prevent this he advocated the mixture of a small quantity of bran with their food. In the iron and coal works, they were in the habit of giving their horses a few peas or beans, but to agricultural horses, or horses employed on ordinary road work, oats should be given. He thought when horses were about to be turned out from the stable to grass, the more gradually the change was brought about the better. If they were turned out for a few hours only, and so avoided a too-sudden change from one food to another, it would be a good thing. With reference to giving horses in full work the ordinary quantity of corn before turning them out to grass, he thought such a plan a good one, as then the horses would not be likely to overload their stomachs with green food, and they would reap full benefit of the change of food. But he should take care to allow the horse to have the whole allowance of dry food, which was necessary, before turning him out; because if he had the grass before the final feed of corn, the stomach would be likely to be overloaded with green food, and indigestion would probably follow. With reference to the question about the manner in which horses should be worked, he was of opinion that if a team of horses were worked eight or nine hours at a time, and then taken into the stable after performing their work, it would be more beneficial than if they were to do their work after resting two or three times in the day. In London this was the practice with owners of horses, and the plan was admitted to work very well. But there the horses were not usually out for so long a period as nine hours. He should not, however, recommend abstinence from food for that length of time. He was a great advocate for the nosebag, and he believed since its introduction became general, on the recommendation of Professor Coleman, stomach staggers were not so prevalent as they had been before. This he believed was due in a very great degree to the use of the nosebag.

On the motion of the CHAIRMAN, a vote of thanks was given to the Professor for his lecture.

GLOUCESTER ROOT SHOW.

JUDGES.—Roots: S. Priday, J. Witcomb, and D. Vick.

R O O T S .

SWEDES.

Twelve of any variety.—First prize, Earl Ducie, Whitfield Farm; second, C. H. Price, The Hayes, Newent; third, J. Copner, Hill Farm, Stonehouse. Commended: C. Cadle, the Hall, Awre. Six heaviest, no award.

TURNIPS.

Twelve white round.—No entry.
Twelve Lincolnshire red globe.—No award.
Twelve green globe.—First prize, C. H. Price; second, T. Robinson, Longford House.
Twelve yellow Scotch.—No award.
Twelve grey stone.—No entry.
Twelve yellow tankard.—No entry.
Twelve tankard (other varieties).—J. Copner.
Six heaviest.—C. H. Price.

MANGOLDS.

Twelve yellow or orange globe.—First prize, N. Jenner, Buckover Farm; second, I. Theyer, Zoons Farm, Hucclecote. Highly commended: C. Cadle and Earl Ducie. Commended: T. G. Parry, Highnam Court.

Twelve long yellow.—J. D. Crump, The Hawthorns, Corse.
Twelve long red.—First prize, N. Jenner; second, T. Morris, Maise-more. Highly commended: Capt. Lysons, Pontville, Bristol-road.

Twelve red globe.—J. D. Crump.
Six heaviest.—First prize, N. Jenner; second, T. Lowe, Hucclecote.

CARROTS.

Twelve red.—First prize, B. St. John Ackers, Prinknash Park; second, T. Lowe.
Twelve white.—First prize, Earl Ducie; second, J. Buchanan, Campden.

PARSNIPS.

Twelve.—First prize, B. St. John Ackers; second, W. Bannister, Barton-street. Highly commended: T. Parry and T. Robinson.

COW CABBAGE.

Three large.—First prize, Earl Ducie; second, J. H. Tyler, Tytherington.

KOHL RABI.

Twelve green.—First prize, J. Buchanan; second, T. Gambier Parry. Highly commended: J. Copner.
Twelve purple.—First prize, J. Buchanan; second, J. Copner.

KING'S ROOT SHOW AT COGGESHALL. — List of the Prizes: Champion orange globe wurzel.—First, Messrs. Dixon, Wickham; second, R. W. Hall Dare, Wrenningham; third, E. J. Ash, Chadwell, St. Mary's. Yellow globe wurzel.—First, Messrs. Grout, Totham; second, — Staines, Gosfield; third, R. W. Hall Dare. Red globe wurzel.—First, Messrs. Dixon; second, — Staines. Long red wurzel.—First, W. S. Goodchild, Glemsford; second, Messrs. Dixon. Long yellow wurzel.—First, R. W. Hall Dare; second, — Staines. Intermediate wurzel.—First, T. Yeldham, Stambourne; second, R. W. Hall Dare. Heaviest mangel.—First, W. S. Goodchild. Unrivalled swede.—First, W. Joyce, Waltham; second, Mrs. Honeywood, Marks Hall; third, T. King, Halsted. Skirting swede.—First, J. Hutley, Stebbing; second, J. Howell, Little Walsingham; third, — Bolton, Terling. Heaviest swede.—J. Hutley. White globe turnips.—First, W. Stubbins, Boreham; second, Mrs. Pyle, Sidmouth, Devon. Green globe turnip.—First, H. Smith, Leigis; second, G. Pettitt, Mount Bures. Green kohlrabi.—First, Central London District School, Hanwell; second, Mr. D. Robertson, Avely.

CARMARTHENSHIRE FARMERS' CLUB.

MANURES.

At the usual quarterly meeting in Carmarthen, Mr. D. Davies, Ystradwalter, president, in the chair. The raffle took place, when the following prizes were distributed: Horse-rake, Mr. W. W. Prosser, Altyferin; chaff-cutter, Mr. Thomas; weighing-machine, Mr. Davies, Tpyicea; knife-stand, Mr. J. Rees, Llwynyffortune; cart-ropes, Mr. D. Harries, Abersanu; dung-fork, Mr. T. Davies, Wernddu; Mr. Thomas, merchant; Mr. P. Lewis, butcher; hay-fork, Mr. D. Jeremy, Cwmddu; Mr. T. Rees, Ivy Bush; Mr. Davies, Waunllane; Mr. Humphreys, Coed; Mr. Thomas, Penlan; Mr. Davies, Cncoed. The winner of the horse-rake had to pay £4 towards the funds of the Club.

Dr. HOPKINS then said: I have been called upon somewhat suddenly to introduce the subject of Manures. Manure is a very large subject, and one intimately connected with every transaction in farming. We are almost connected with it during the whole of the year; and in one way or another, it comes up for discussion at every meeting of our Club, unless we except that of breeding of cattle, and our farm produce. Manure is composed mostly of two constituents, represented by two divisions—the organic and inorganic—all manures are divided between these two, and it will be for you, gentlemen, and I see many here well capable of taking the matter up from a practical point of view, that I do not intend to do more than introduce it to you. It is for you to decide the manures best calculated to the cultivation of your lands. There are many gentlemen in this meeting who, I am sure, will follow up my few remarks. I shall first speak with regard to the advantages of manure as the main pillar of farming. We have various ways of plying manure. Take organic first, it is dung, or farmyard manure. We all know that farmyard manure is the best, that is, if we can get it; but in this country we are unfortunately unable to procure a sufficient supply. Whether large or small farmers can farm profitably, before they can do so well, they must have plenty of manure. I therefore would suggest, where that is deficient, as unfortunately it is in too many cases in this country, that greater care should be taken of the liquid manure arising from that already existing, by the erection of tanks to save all that now passes away to where it is not required. I think too little attention has been paid in nearly all the farms of this country, to the use of liquid manure; I must state that here, too little attention has been given to the draining from farmyards, and the saving of such. Another portion of organic manure is the neglect of plashing our hedges, and getting hold of all sorts of vegetable remains, such as the clearing out of ponds and ditches, because it is a fact that what was once a vegetable will become a vegetable again; I assert that there has not been sufficient attention paid to the scraping out of old ponds and ditches, and to the use of other vegetable remains at present at our service; they have been too often neglected in this country. Considering the thinness of the soil with us, the use of every adjuvant is indispensably necessary—the great consideration is to make as much manure as you can, which, as I told you before is the main pillar of farming. Another thing which is very valuable to us and a great deodiser and absorbent is peat. It is nearly within every one's reach, and when dry is a great absorbent of liquid manure, and should be placed at the bottom of every farmyard to absorb that which would otherwise be lost. Having been in water for so many years, it is not nearly so valuable as a manure until it has been animalised if you have tanks or any other convenient place, in which you can add the liquid manure so as to produce that effect, I say you cannot make a finer manure than with peat. It is really pure carbon, or charcoal, and as I said before has the power of charcoal of deodorising. I am not going to detain you by any lengthened remarks, because there are many practical men of talent to follow me, and it would be impertinent on my part to dictate to you as to which is the best plan; that I leave necessarily as an open subject. But now I come to the inorganic manure; at the head of all which is lime, then we have phosphates and superphosphates, burnt clays, common salt, and ammoniacal salts, soot, &c., &c., and it is for you to say, how far one supersedes

the other in your different localities; how far they will meet your necessities and supply your wants. Taking cattle or sheep for example, these ingredients will be found of eminent service in rearing and feeding. Burnt clay you will find is an exceedingly beneficial manure upon the poorest of land where peat is to be had to char it; if you burn one with the other it makes an excellent and active manure. A little work has been published by an celebrated Professor under the French Government of how to farm without manure, and if you read it you will find this. I must say the essay is a very scientific and valuable addition to what we know of farming; you will find there that the analysis of farm produce such as beet root, peas, beans, and the leguminous plants, abstract certain salts from the soil which if returned to it by the grower will make it as fertile as before for the same or any forthcoming crop. If you grow mangolds, wheat, and other produce from the soil, you will find that it robs it of certain ingredients in excess, which you as farmers will have to return to the soil, so as to reproduce the fertility of which it had been deprived. It is for you to return to the soil that of which you have taken from it, and give it back to put it in the position in which it was before you meddled with it. Farming is nothing more than an exceedingly rough system of gardening, where if you do not rotate the crops you will have to resupply what I told you before, you deprive the earth of. All we can do is to adopt the best plan that our circumstances will permit. Potash is like ammonia or lime; a great fertiliser in minute quantities and in the work published by the French Government, you will find how these are to be supplied. Please let me tell you, gentlemen, this is not hypotheses but founded upon most careful experiments, conducted in the most elaborate manner. Because you often hear men say, "I think this and I think the other," when in reality they know next to nothing about it, for these experiments have been carried on in the science of chemistry without affection or fear of any scrutiny, so as to render the greatest amount of advantage to the agricultural public in general. I now leave to my followers the filling up of any omissions on my part, and to those gentlemen who have commissions to urge the respective merits of their favourite measures, and to show them to be worthy of your notice.

Mr. BRODIE did not profess to know much about the scientific side of the subject that had been so ably introduced to them by Dr. Hopkins; but if it would do any good one way or other, he would tell them what he really did himself. He might tell them that he had not been successful in his first means for supplementing his farm yard manures. He had used animalised carbon, and had found that it was not worth a penny. He had dropped down now to a plain and simple mode of manuring his farm. This scheme of his did not require any scientific knowledge; common sense, he might tell the Doctor, was just as good as chemistry. Besides, in this scheme there was another advantage; he was not the least careful who he dealt with; he would as soon buy from Mike Sullivan and Co. as from J. B. Lewes and Co.; as soon from anybody else as from H. T. Proctor and Co. Perhaps Dr. Hopkins or some of them would not believe him when he announced his plan; but in truth it was merely this: he crushed his own bones. ["A very good plan" from Dr. Hopkins.] Bones he bought all the year round, in different quarters, as he had said. These bones he allowed to ferment; he did not even dissolve them. They came to the roots of the plants, to the help of the land, as well that way he found as if they were dissolved; not having the appliances about for dissolving the bones thoroughly he took this method and was satisfied with it. In any other way of dealing with these bones he found that often the acid in them that was of use was all but lost; at all events, the bill was always to pay, which could not well be a point of importance in the eyes of the farmer. He believed his plan was a good one. He went in, of course, after so crushing the bones for careful mixing. He hoped nobody would adopt his plan and outstrip him in success.

Mr. WARREN would only supplement Dr. Hopkins's remarks as to manures that were very much neglected, by remarking

that those who live near the sea left most valuable manure to be unappropriated, and so go to waste. Admirable crops and large crops were grown with such manure he assured them; it contained potash and soda and other salts. He thought the manure to be thus obtained should be more utilised than it was.

Mr. D. T. MORRIS explained that when it was known that Mr. Pughley was unable to be with him it was suggested that a few notes that had been put together on the subject he should read to them; but he was pleased that the arrangement had been carried out as it had been. He would still, if it pleased the club, read to them the notes of the paper to which he referred. He then read as follows: With your permission I beg to offer a few remarks upon farmyard manure, more particularly that of horse-dung, which I verily believe many farmers in this and the adjoining county do not value nearly as much as they ought to. The dung of farmyards generally is the produce of hay, straw, turnips, and so forth, and is used, as you are all aware, as provender or litter upon the farm. When cattle are housed, it is invariably carried ad put in a heap on some high place—sometimes in large heaps—consequently when heavy rain comes it washes away all, or nearly so, of the fertilising properties it contains; therefore, I would suggest that to retain the liquid a place should be made purposely for holding it—say two or three feet deep—and if the ground is not of a clayish nature, let it be cemented so that the ground should not absorb the liquid, as the latter contains the principal fertilising ingredient. This tank or cistern should be so constructed as, in the event of an overflow of liquid, another tank should be placed for the surplus; and, when this is full, let it then be taken in a cask upon wheels and allowed to run over the surface of the field, the dung, after a time, being well mixed and taken to the field and spread upon the land when in tillage; the dung, covered by the earth, soon passes through its course of fermentation and becomes decomposed and mixed, or combined with the matter of the soil. Where the dung produced is very rich and decomposed, as where cattle have been feeding in stalls on juicy and nutritive food, it may not require much turning over to fit it for use; yet even in such a case it is generally beneficial that it be turned over before being used, the effect being to ferment the mass not only sufficiently but equally, and to mix its different parts together. Now, referring to horse dung particularly, I may here remark I am often grieved when going into a farm-yard to see a large heap of this steaming away. Possibly you may not all be aware that the steam you see and smell is the fertilising properties of the horse dung, and the means by which the farmer may return these is to put the stable dung into a square heap, and in every twelve or eighteen inches rise place a layer of gypsum, fine earth, or ashes. Then this evaporation condenses and falls back in the dung, and when the manure is got out, instead of being dry and mouldy, with no fertilising qualities, it will be like bread thickly buttered, with all the ingredients horse dung contains. I should also observe that when the stable opens upon a common yard the dung should not be allowed to accumulate in a heap about the stable, but be spread abroad upon the general heap. A square wall built in the yard to contain the dung would be advisable, so as to prevent evaporation through the sides. Professor Muspratt says, "it is better to take dung into the field fresh from the stable and plough it into the ground than throw it in a heap and allow it to evaporate." This I can easily understand, as you have then all the fertilising properties of the horse dung in the soil. Low also says, "that horse dung is more susceptible of quick fermentation than that of oxen," and this is why I should advise dung to go through the process I name. After fermentation is over there should be a thorough mixing previously to its being put upon the land. Preparing manure in this way you will find one ton worth three of that where the evaporation has escaped. Perhaps there are some here who imagine the solid excrements of a horse that is badly kept have the same fertilising properties as those of a horse well kept; most decidedly not, for the better you keep your horse the better he will do your work, and the dung will be worth three times as much.

Mr. HARRIS said the point he would more particularly press on them than any other, perhaps, was the importance of looking after the farm-yard liquid manure, which so often was allowed to run waste. He quite agreed with Mr. Morris in what he had said as to the horse manure, and the prevention

of loss or waste from evaporation. One thing had been said in which he did not agree; that was Dr. Hopkins' remarks relative to peat. He differed from the Dr. in this question *in toto*. Peat was one of the worst so-called manures they could have. It would not pay any one, he believed, to spend five shillings on it. There was, for one thing, more labour required regarding it than it was all worth. He certainly would not advise any one to speculate in peat as a manure. He believed there ought to be no farm-yard without a building for the accumulation and mixing of farm-yard manures; all the farm-yard manure, which was the best they could have, should be received into this tank. Much of that valuable manure was at the present time neglected and overlooked; and if it was all utilised, and its value fully appreciated, there would be almost no necessity for artificial manures. The expense of haulage, which was very great, he alluded to briefly as a great difficulty in the way of the farmer perfectly manuring his land. Nitrate of soda was one of the most marvellous things he had ever seen; it had, however, to be used with caution and care.

Mr. THOMAS (Derllys) believed when he got the intimation of a paper by Mr. Pughley on Manures, that he and Mr. Morris would come forward as the advocates of an entirely new manure. He had heard them talking of a new manure that was to be got at the works; sulphate, or hydrate of copper it was, if he mistook not, which being mixed with earth, made an excellent manure. He thought Mr. Pughley, had he been here, would have been more taken up with chemical manures than any other. The farm-yard manures they knew a little about, but chemical manures they lived to learn about. They, in using these chemical or artificial manures, were—at all events most of them were—groping in the dark, and did not know what they got. Especially after such short crops as they had had this year, any information or suggestions Mr. Pughley could have given them would, he had no doubt, have been acceptable and valuable. Many things were very much neglected, as they had heard. One of the neglected things was to be found in this—that they had never provided any safeguard for the farmers, any means of ensuring that in what artificial manures they bought they got their money's worth. The best firms were represented, no doubt, in this town, by men of good standing; but, after all, he thought it was the duty of this club to guard the members against being taken in by the sellers of artificial manures. This could only be done by arranging for analysis of these artificial manures.

Mr. LEWIS spoke strongly in favour of peat as an absorbent and fertiliser; he likewise agreed that in the slaughter-houses of towns like Carmarthen there was a great waste of very valuable manure. In Llandilo Mr. Thomas had the whole benefit of the slaughter-house, and he even complained of the manure being too rich; he advised him to mow sooner than he did.

Mr. HARRIS (Llandilo) referred to a manure he had used, that was like some that had been mentioned, of little worth—he meant a manure that was called economical. He was now using a much superior mixture—superphosphate and bone, mixed half-and-half. Farmyard manure, of course, he attempted to secure in as large quantities as possible.

Mr. BROADMAN said the subject was a large one, but it could be narrowed down by remembering that farmyard manure was the mainstay of the farmer, and that all artificial manures were supplementary to it, and were required because of the limited quantity of it that could be procured. He advised thorough economy in farmyard manure, especially liquid, and stated the arrangements he had on his farm used for the preservation of it all. He had everything under cover, thus avoiding the loss of liquid manure, and the decrease in value of the other kinds through rain or the effects of the sun. He explained, likewise, the careful mixing he made of the different manures. By the system he adopted he had manure worth from 7s. to 8s. per load. Coming to artificial manures, he remarked that he had tried nitrate of soda alone, and was not pleased with it. He was thoroughly convinced of the propriety of the scheme advocated in a work published under the auspices of the Royal Agricultural Society, in which it was set forth that the mixing of the mineral and other manures made a difference in the effect of the manures on the land, doubling if not sometimes trebling it. Nitrate of soda and mineral superphosphate were calculated to keep the land in as perfect a state of productiveness as anything he knew. Referring to the way in which the manure was piled where there was no tank or pit on the farm, he thought there was great room for

improvement; they piled up their heaps in these half-square and half-oval forms. By this method, he held, the rain water was allowed to get into the heap and destroy the fertilising powers of the manure. He recommended the manure to be heaped up in the shape of a house, the thickest part in the middle, and earth to be then heaped on the top of that. He was sure the more science they applied to the cultivation of the soil the greater would be their reward. He mentioned to the members a very excellent book he had recently come across, Professor Johnson's Agriculture, Chemistry, and Geology, which treated of the application of manure, and the way to preserve it.

Mr. JAMES (Carregceggan) pointed out the importance of giving every kind of land the manure suitable for it; he was sure any money carefully spent in this work, or in the price of manure would pay them better than any bank.

Mr. THOMAS (Moreb) spoke very strongly in favour of slaughter-house manure, of which he had a fair trial at Llandilo. He found the few fields he held even too richly fed; he was prevented, however, by his landlord from taking more than one crop a year, so that he made sure of getting a thundering good one when he did cut. He agreed with the majority of the speakers, as to the value of farmyard manure, the advisability of saving it, and on many of the minor points as well.

Mr. J. L. PHILLIPS laid particular stress on mixing the manure they intended to lay on the land with earth or water; he repudiated the idea of the necessity for a tank; it was only necessary to have a pit at the farmyard for the purpose; it would allow of all manure being there mixed sufficiently. Nothing was of more importance than the thorough mixing through and through. They could not expect good manure from anything but well fed animals; it would not do to saturate straw with dirty water and call it manure. He condemned at some length the application of lime to the land when it was not required; when applied under such circumstances it was not manure, or food to the land, but poison. Referring to artificial manures he came to speak of "the Economical," after warning them that in trying artificial they should not strive after or look for anything else than a fair article for fair price. This "Economical" they were told of was advertised as having a backing up of 2,000 testimonials, one of which was from his friend on the right, Mr. W. E. B. Gwyn, Plas Cwrt Hir. That manure was supposed to be a substitute for guano; it certainly was nothing of the sort; it was quite worthless. Mr. Phillips believed peat was a good manure, and that the member who had spoken of it as no manure at all was perfectly wrong. He suggested a pit with good mixing and the use of absorbents, so as to avoid the expense of a tank. The rain water could, he showed, be thrown off.

Mr. GWYN agreed to a very great extent with Mr. Phillips' remarks. On his own farm all the manure was well mixed as it was carried out every day. The suggestions as to peat, made by Dr. Hopkins, he considered excellent; and among the unutilized means at the hand of every farmer, some of which had been pointed out by Dr. Hopkins, he thought the refuse from hedges and ditches was not sufficiently looked to. He intended himself, in the coming season, carting 300 or 400 cartfuls of that for the purpose of mixing with light soil; it made a capital manure. Referring to the Economical Manure, he had tried it, and had, it was true, sent a testimonial to the dealers that it was not worth much.

Mr. MORGAN, Llwyn, supported warmly the proposal for the protection of the members by the club, through the appointment of an analyst. He was certainly in favour of peat as a manure, and proved its value by several illustrations. He held that the mixing of all manures in a pit, which should be covered with earth, one of the best absorbents we could have, was a capital plan. He had tried the Economical, but he had not intended to say anything about it unless somebody else spoke first; he thought nobody else could have been such a fool as to meddle with it.

The CHAIRMAN having thanked Dr. Hopkins on behalf of the club, and summed up the discussion,

Dr. HOPKINS, replying on the discussion, said that Mr. Harris made a great mistake in saying that peat was not a manure and no use; and he (the Dr.) was glad to find that every one also seemed to share the opinion that he had enunciated in his opening address to the effect that peat was a very beneficial manure, and especially so when mixed with animal

substances. Peat was nothing less than the decays of the vegetables of ages, mostly grass and water plants, the remains of which consisted nearly of pure carbon or charcoal, known to be an enormous fertiliser, and even when put upon red land, unaided, proved a considerable fertiliser. With regard to the observations which had been made as regarded clay, he would say that even brick dust when placed on vegetables, especially the vine was of itself a great service as a manure. As an illustration of his meaning, he might say, and he thought he would bring it home to every practical farmer, that when a bonfire had been made upon land so as to clear the surface, the crops there were three weeks earlier; a more plump, and a finer colour, and could be seen at a distance before any other portion of the field, although the ashes had been carefully scattered about. In addition to what had been said of the heaps of manure, the best plan that had hitherto been proposed had been the making of a tank in the centre of the farmyard for receiving the liquid manure, into which a pump could be fixed at a very small cost, and by which means the liquid manure could from time to time be pumped over and upon the heaps, so as to increase the strength of the manure to the utmost extent. Then again he might remark that those gentlemen who farmed in the vicinity of towns where bituminous coals were burnt, could not do better than purchase the soot, which might be easily obtained at not more than about from 4d. to 6d. per bushel. This could be sown broadcast upon wheat or grass lands with great success and advantage, and made a fine and powerful manure.

COUNTY BOARDS.—Whilst the Central Chamber of Agriculture has passed a resolution in favour of extending District Highway Boards through the country, and making the Highway Acts compulsory, some of our local Boards have been making ineffectual efforts to dissolve themselves. There can be no doubt that in the Eastern Counties the new system is extremely unpopular; but does it follow that we should return to the old system, with all its neglect and irregularity? Let us hope not. The complaint against the new system is that it is too expensive. This is chiefly because the District Surveyor receives a high salary for doing very little beyond issuing directions and keeping accounts, whilst the Waywardens do the practical work of Surveyors as the Parish Surveyors did under the old system. How would it be to have an Inspector of Highways for every County, County Boards County Rates (aided by Government support, if we can get it), and Parish Surveyors, as of old? Under that plan the expense of employing a Professional Surveyor would be spread over a larger area. One man can inspect a very extensive mileage of roads in the course of the year, and it is said that the District Surveyors now do little more than inspect the roads. The Parish Surveyors would, of course, act under the control of the County Board, and would be compelled, if unwilling, to keep their roads in proper order. Complaints could be made to the Inspector, who would report to the Board. It may be objected that if there were a County Rate, Parish Surveyors would be careless of expense. Well, perhaps they would not be so parsimonious as they commonly were under the old system, but the ratepayers, who would elect them, would take care to choose men not likely to be extravagant, and the Board, too, would check inordinate expenditure.—*The Essex Standard*. From the county report of our own East Essex correspondent as given in another place, we gather that "the proposal of the Central Chamber of Agriculture that highway districts should be made compulsory throughout the country, will be most unpopular in the Eastern Counties. Two of our district boards have for some time been ineffectually attempting suicide, but the magistrates—no doubt members of the Humane Society—insist on saving their lives. But the magistrates should have nothing to do with the matter. We want County Financial Boards to take charge of the highway and other business."

THE IRISH FLAX TRADE.—At the meeting of the Ballineen Farmers' Club, Colonel Bernard, the chairman, said he had received a letter from Mr. Anderson, of the Belfast Flax Association, from which he regretted to observe that trade in the North of Ireland was still dull—a circumstance that would account for the comparatively low prices obtained for flax.

CONFERENCE OF POOR-LAW GUARDIANS IN THE WEST.

The annual Conference of the Poor-law Guardians of the South-Western Counties took place at Sherborne, under the presidency of

Earl NELSON, who said he had failed in getting any one to read a paper that day, but what they really wanted was not so much a statement of fact as discussion. It was often remarked at these meetings that there was very little method in them. It was true they began perhaps with medical relief, or friendly societies, and then passed to the loan system or sanitary officers, and then to poor-house accommodation; but every speech was sure to end in the question with which their discussions were mostly filled—the question of out-door relief—and people who were outsiders looked upon it as a jumble, and did not understand it. It was very easy to give a reason why that must be the case, and at the same time to defend the committee for having proposed at all the conferences the question—What accommodation is essential in a workhouse to enable the guardians to carry out the provisions of the Poor-law and to meet the present requirements of the Local Government Board? They were all pretty well agreed that the object of the Poor-law should be to encourage thrift, and to discourage pauperism by using the workhouse as a test for real destitution, and by doing away as far as possible with out-door relief. It was no use to notice matters, and to talk about people's "independence." There was no real test but "the house." Every one was willing enough to let their parents receive medical or out-door relief, or to receive it themselves, as long as they were left in their own dwellings; and therefore without the house-test they were encouraging a pauper spirit and they were discouraging thrift and independence. Most of them had heard of the man who was about to emigrate to New Zealand, who, after making all inquiries as to his chances of obtaining land and getting on, finally decided he would stay in this country "because there is no workhouse in New Zealand." But what he (Earl Nelson) felt was, that although the house-test was so essential as a general rule with their present workhouses, yet without a better classification than they had now it was really too severe a test in many cases; and the knowledge of that fact, that it was too severe, was the cause why it was so seldom thoroughly applied. With single persons, and with illegitimate children, the matter was plain enough; they of course would go into the house. But with married people with a family the test was too severe. What did it amount to? The complete breaking up of home and family life. It was such a break-up that the chance was lost for years afterwards of a man having a settled home. There was the sale of his little furniture, and altogether the circumstances were of a most depressing character. They must not forget that family life, which they thus destroyed, was at once the greatest civiliser and encourger of self-respect and independence. In too many unions there was the certainty that the children would be brought up with a pauper spirit; and that the more decent girls above school age were degraded by being mixed up with the foul-mouthed companionship of others. That was one of the things they ought to discuss, how they could best classify the inmates of a workhouse so as to avoid those evil results. Some people said "Oh! we won't put a poor girl with women who have illegitimate children; we will put her with the married women." Now his belief was from the married women, when they were freed from the restraint of husband and family and were angry at being there—he believed there was as much evil to be learnt from them. Therefore it was one of the points that required a great deal of discretion before they said exactly what the rule was to be, as to where those untouched children should be placed. Because of those things they were not to discontinue the house test, but they were to take care the houses were properly classified as far as they might be. It was necessary to notice the condition of the poor-house itself. That was the root of the thing, and it would be very wrong of the guardians to press the test unless they were doing all they could by sanitary measure to reduce the number of causes which brought people into poverty. They should take care to organise a system of medical clubs, or other clubs, to find in sickness apart from the Poor-law, to give some opportunity to people to be saved from drifting into pauperism. In some places the loan system had

been very successfully tried, and he maintained they were bound to start it if they applied the house test rigidly. They were bound to give people the opportunity, if they liked, instead of breaking up their families, to give security and take a loan. Then, as he had said, they must see that the house was properly ordered. He would ask the chairman of the Wincanton union, if he was present, to introduce that subject to them, and to state how far his rules had been carried out. The noble earl proceeded to refer to several classes of paupers to whom the house-test should be applied, amongst them being wives deserted by their husbands, the families of prisoners and persons of drunken and notoriously bad habits, and the wives of militiamen. With regard to the last named class he said Government, if they would have married militiamen, should pay them enough to support their families, and should also take care that the money was sent to their families, otherwise the ratepayers had to make up the deficiency. [A VOICE: Instead of the taxpayers generally]. He then reverted to the difficult subject of preserving workhouse children from the leaven of the pauper spirit, and concluded by calling attention to a plan which had been recently suggested, by which there would be separate houses for children and for aged and infirm paupers.

Mr. GORDON, the secretary, spoke of the advisability of originating an asylum for the Western Counties for idiots. He did not mean for harmless and chronic lunatics, as their removal from the county asylum would seriously prejudice the usefulness of those institutions. He also alluded to the immense number of lunatics maintained out of the rates, whose relatives were in a position to pay for their maintenance. That was a subject worthy of their consideration.

Mr. DODDINGTON said that militiamen received about 15s. a week, including their bounty, and therefore their families ought not to come upon the parish. By a recent regulation they could draw money so as to send to their families.

Mr. FLESTING (Mere) suggested that the unions should be grouped either in counties or in divisions of counties; that the present buildings should be utilised, and that one should form a hospital, another a convalescent home, a third a reformatory, and so on.

Mr. JARVIS (Mere) believed if small unions could be grouped together they could be worked much more economically than they now were.

Lord FORTESCUE said his opinion was that the workhouse should be used, not only as a test, but as a safe shelter for the aged and the infirm. The difficulty of getting persons to nurse others than their relatives was increasing, and they had had to pay 5s. or 6s. a week for a nurse to a pauper. Unless they had some assurance there were persons of good character to look after infirm patients, they usually insisted on their coming into the workhouse. He thought it exceedingly rash to give out relief where friendless and kinless old and infirm persons could not secure nursing. With regard to grouping of workhouses, it seemed to him a wonder that in large places—the metropolis for instance—grouping had not been effected long ago. He understood that the difficulty with respect to vagrants would have been got rid of years ago if the Government had displayed more firmness in the matter and had not shown such sympathy for the vagrant. In fact, they required wards for him instead of remitting him to the police station. He quite agreed with what had been said about old men and women; he thought out-door allowance for them was best. He did not think it desirable to form a convalescent home in connection with the Poor-law.

The Rev. W. SAVAGE (Wilton) said there was one class he should like to see turned out of the unions, and that was the idiots. Very often their habits were so filthy and dirty that they made the older paupers most uncomfortable. With regard to workhouses, he should like to see them made stern test-houses for the idle and dissolute, and as comfortable as possible for the aged poor. The windows were generally like those of prisons. He should like the old invalids to have a sitting room on the same floor as the sick ward.

SIR C. B. GRAVES SAWLE thought the grouping of unions would answer in agricultural colonies, but not in populous districts.

The discussion was continued, some of the guardians expressing an opinion that there should be county accommodation for idiots. A guardian of the Bridgewater Union said that that house they had adopted the boarding-out system, and had found it answered well.

After a two hours' discussion, The CHAIRMAN asked if any gentleman desired to say anything on the question before them—What accommodation is required in Workhouses? A discussion followed, after which the Chairman summed up, observing they could not go fully into several of the subjects that had been raised, but some of the suggestions had been most valuable. He might take it for granted that they were all against any large additions of expenditure, and were agreed their present system might be relieved by the boarding-out system, which in his union had been a great success. He was of opinion one special idiot asylum for a district would be a great advantage. With regard to grouping, if it only amounted to turning one house into a district school he thought some relief would be afforded. If it were possible to abolish the vagrant wards they would have greater room for classification. He should have been glad to hear how good masters and good house committees got over their difficulties with regard to classification, and broke through red-tapism in particular instances.

It was agreed that Mr. Gordon, the secretary, should represent the conference in the general committee which will assemble in December. It was further agreed the five representative members should be Colonel Cox, Dorset; Mr. Broadmead, Somerset; Earl Nelson, Wilts; Earl Fortescue, Devon; and Sir Charles Sawle, Cornwall. It was settled the next meeting should be held at Plymouth, under the presidency of Earl Fortescue.

The CHAIRMAN read the rules of the Wimborne Union with regard to out-door relief. No relief is to be afforded to—1. Non-residents. 2. Deserted wives. 3. Wives and families of convicted prisoners. 4. Single women, pregnant or with illegitimate child. 5. Wives of militiamen. 6. Children between six and fourteen not attending day-schools. 7. Those whose families are capable of supporting them. 8. Drunken, improvident, or notoriously bad characters. There were some other regulations, such as no midwifery order to be granted but by way of loan, except in certain cases.

Various other topics were then discussed, during which Lord FORTESCUE proposed that all relief in emergency, medical or otherwise, should be considered as relief on loan. This proposition was seconded, but was not pressed to a division.

The CHAIRMAN asked what they should do where an applicant for relief received pay from a friendly society? The usual way was to cut his club pay in half. He suggested they might treat the whole pay as for his wife and family, and relieve the children fully.

Mr. WILSON said his board had decided that money received from clubs should be treated as other property, and they had found no inconvenience.

Some conversation took place upon making sons support their parents.

The conference next year is fixed for the second Tuesday in November, at Plymouth.

A LABOURER'S EVICTION.—The case of *Hitters v. Allfrey*, tried at the last Spring Assizes in Reading, has just been before a full Court at Westminster. The action was brought by a labourer against Mr. Allfrey, of Wokefield-park, for being turned out of his cottage without due notice, he being a yearly tenant. At the trial, the jury found for the defendant; but several points of law having been reserved, Lord Coleridge, the judge, asked the jury to state what damages they would give if the decision on the points raised were reversed, and they stated £5. The decision on all these points has been reversed, and the verdict is accordingly entered for the plaintiff; but as the £5 damages do not convey costs, application for costs is to be made. The verdict itself, however, is not yet to be considered settled, as it is understood that the defendant will appeal to the House of Lords. Mr. C. Henderson, of Reading, is the solicitor for the plaintiff.

BATH AND WEST OF ENGLAND SOCIETY, AND SOUTHERN COUNTIES ASSOCIATION.

The monthly meeting of the Council was held at the Grand Hotel, Bristol, on Tuesday, the 27th Oct.: Sir J. T. B. Duckworth in the chair. There were also present Messrs. R. Breunridge, J. Gray, and J. C. Moore-Stevens, vice-presidents; C. T. D. Acland, J. D. Allen, H. Badcock, J. T. Boscawen, C. Bush, R. H. Bush, R. R. M. Daw, T. Danger, A. F. M. Druce, T. Duckham, T. Dyke, C. Edwards, W. R. Gilbert, F. Gill, J. Goring, A. Grenfell, H. M. Holdsworth, H. P. Jones, H. A. F. Luttrell, H. St. John Maule, R. Neville, S. P. Newbery, G. Radmore, J. C. Ramsden, G. Simpson, W. Thompson, R. Trood, C. A. W. Troyte, E. U. Vidal, H. Williams, R. Wippell, H. Spackman (Official Superintendent), and J. Goodwin (Secretary and Editor).

Payments to the amount of £1,172 11s. 2d. were sanctioned by the Council, and a list of District Agents, recommended for the purpose of increasing the list of Members in their several localities, was provisionally approved.

On the motion of Mr. Jonathan Gray, seconded by Captain Acland, the following Report of the Arts Committee was received:

Your Committee have to report, with very sincere regret, that Mr. Edward Simeoe Drewe, who for so many years has acted as Chairman of the Department, has felt constrained by continued indisposition to retire from the office; but they venture earnestly to hope that Sir T. D. Acland, Bart., M.P., may be induced to act as his successor. The retirement of Mr. R. R. M. Daw from the office of Hon. Secretary is an additional cause of regret on the part of your Committee. For the long term of fourteen years he has discharged the duties of the office with exemplary zeal, efficiency, and courtesy; and apart from his generous offer to initiate his successor in the duties of the office they would feel considerable anxiety with reference to the future. The time, however, has now arrived when they deem it expedient that the various departments of the Society should be consolidated, and they recommend that the Secretary of the Society be directed to undertake the duties of Secretary to the Arts Committee at such increase to his salary as the Council may think fit. Your Committee, after long and anxious consideration, have arrived at the opinion that the Arts Exhibition, in its several branches, should be held, as usual, next year, at Croydon; and they have to request of the Council a grant of one hundred pounds towards the Art Union as in former years.—EDWARD W. WILLIAMS, Chairman.

A special vote of thanks was passed by acclamation to Mr. Drewe for his services; the Council expressed their gratification that Sir T. D. Acland, Bart., M.P., consented to act as Mr. Drewe's successor; a committee was appointed to consider the extra amount of salary to be paid to the Secretary; and the Council granted the usual sum of £100 towards the expenses of the Art Union at Croydon in 1875.

Tenders for the printing of the Society's catalogues, and the supply of refreshments at the annual meetings, in both cases for one, three, or five years, were directed to be invited by advertisement; but the contract of Mr. Keene, of Bath, for the Society's general printing, was renewed for the term of five years.

The stock and poultry prize sheets, and the implement regulations for the Croydon meeting were brought up, and, after some minor alterations, were approved and ordered to be printed: Monday, the 31st of May, being the day fixed for the commencement of the meeting.

The Council, while recognising the desirability of having a railway siding communicating with the show-yard at Croydon, declined the responsibility of contributing towards the expense of its construction; but left it to the enterprise and discretion of the local railway companies to act as they may think proper in their own interests and those of the public.

The following new members were elected:

Lord de Mauley, Langford, Lechlade.
The Hon. Hedworth Jolliffe, Charlton, Radstock.
W. S. Gore-Langton, Newton Park, Newton St. Loe.
R. Fowler, Broughton, Aylesbury.
J. Outhwaite, Banness, Catterick.
Redgrove and Bowden, Croydon.

Rigg, Wrotham, Sevenoaks.
 H. Roberts, St. James-street, Bath.
 T. Rose, Melton Magna, Wymondham.
 H. S. Waller, Farmington, Northleach.
 Kennet Were, Sidmouth.
 A. E. Wyatt, Strawberry-hill House, Lympstone.

A SHOW AT HOLKHAM.

The Committee of the Norfolk Agricultural Society has decided to recommend that the meeting of next year should be held at Fakenham in preference to Dereham. These two towns being the only applicants, the decision given to the former in preference to the latter will be generally acceded in. One place, however, probably through forgetfulness or doubt, has been passed by, which will be thought, for various solid reasons, past and present, by the agricultural interest, not only of Norfolk, but of all England—as that at which of all others, at this moment, the Norfolk Agricultural Society should hold its anniversary. That place is Holkham Park, the birthplace of that system of husbandry which raised the character of the tenantry of England by the example of its great leader, and by the practical effects which that example produced up to the time when the Holkham Sheepshearings terminated. It is slightly beyond a half-century from that time when the turn of the Western Division of the county again arrives. Year by year since the Society has made an annual migration to the different divisions of the county, its celebrity has risen in the increased numbers and excellence of the stock exhibited, and in the quality, novelty, and superiority of the machinery shown, while the numbers who have flocked to the show, not only of proprietors and tenantry, but also of the cultivators and their families, have increased in a way which has astonished even those who were the most ardent for the change of system—a change which has proved most beneficial to the labourers, and profitable to the Society. The last meeting at Holkham was held in 1821, and as Mr. Coke then gave a *résumé* of the improvements which had emanated from that agricultural meetings, the opportunity would now present itself to compare the advance made within the last half-century with that made during the Holkham annual gatherings. And it is the more desirable that this opportunity should be given from the fact that the Essay for which the Earl of Leicester has offered a prize is to be the result of a personal knowledge of the progress and practice actually made within the specified time. Now it is in Holkham Park that not a little of agricultural advance in cultivation on the Holkham Estate, as well as in the immediate district, will be found. There would, perhaps, be few persons there in 1875 who saw or can know what Holkham and the farms and stock immediately around it were, but the tenantry and the landowners would be able to see and judge by comparison with the above-named *résumé* what it has become under modern improvement, and that union of capital, energy, and science, with practical skill, which has reclaimed nearly one thousand acres from the sea, and made it a prolific and valuable addition to the estate handed down to its noble proprietor, who has proved himself, by his devotion to agricultural pursuits, a worthy son of that great pioneer in agricultural advancement—Mr. Coke, of Holkham. Looking at what has been accomplished on the Holkham Estate, I venture to urge on the Committee to re-consider their recommendation, and, if it be not adverse to the wishes of Lord Leicester, that Holkham Park should be once again the scene of the triumphs of agriculture in Norfolk. We might then hope that the Royal Patron, in common with the landed proprietors and the tenantry, will feel it to be their “duty, not less than their interest, to connect society by one grand bond of harmony” in Holkham Park in July, 1875, as in the days when the first week in July saw the famed assemblage of that time congregate on the domain.—*The Norwich Mercury*.

THE ROYAL AGRICULTURAL SOCIETY OF IRELAND.

The monthly meeting of the Council was held at the office, Upper Sackville-street, on Thursday, October 29th, Sir Allen Walsh, Bart., in the chair. The other members present were Viscount Powerscourt, Hon. Bowes Daly, Major Borrowes, L. Waldon, L. Cust, H. Harris, E. Purdon, D. Millward, J. Robertson, Rev. R. W. Bagot, H. J. MacFarlane, S. F. Adair, C. Connor, P. Riall, H. H. Woods, J. M. Roysse, W. Donnelly, C. U. Townsend, C. Cobbe, R. Chaloner, and J. Simpson.

Major BORROWES, agreeably to notice which he had previously given, moved: “That the wording of conditions for tenant-farmers at present limited for competition to tenant-farmers whose Poor-law valuation is under £ per annum’ be altered to ‘Tenant-farmers holding land under valuation £100 a year,’ and the same intention be carried out in all the rules affected by same wording.” The object, he said, in bringing forward this matter was, that at the last meeting of Council several objections were made against exhibitors whose holdings were over £100 a year valuation. It had been proved that tenant-farmers had competed who held land value for £500 or £600 a year, and, therefore, they were not the class of agriculturists whom it was originally intended should carry off these prizes. By limiting the rule to tenant-farmers holding land under £100 a year, they would effectually stop such parties carrying off prizes.

The resolution was seconded and adopted, with a trifling alteration.

The next matter for discussion was Mr. Macfarlane’s notice of motion, as follows: “That the objection of Mr. M. A. Maher, in reference to the decision at Wexford council meeting, by which his thorough-bred sire Gunboat was disqualified, be re-considered.”

Mr. MACFARLANE said he was not sure whether they had the power to re-consider the matter, and therefore he approached the question with some difficulty. Mr. Maher’s object seemed to be to have the character of his horse—

Mr. CANNON rose to order. They should have the decision of the chairman on the point as to whether or not they could go into the question at all. On looking at the rules a few days ago he observed that no protest on veterinary grounds could be rescinded. That was set forth in page 28, and was under rule 34.

Mr. MACFARLANE moved the following resolution: “That the V. S. at Wexford show, on whom devolved the duty and responsibility of reporting as to the freeness of Gunboat from any hereditary disease, appears to this Council not to have sufficiently informed himself as to the nature of the enlargement on the haugh of Gunboat on the seat of spavin, and the judges, in consequence, could not award him the prize or Croker Challenge Cup; and this Council regret that the rules for competition prevent the decision arrived at by the Wexford Council being now re-opened in favour of such a superior sire as Gunboat.”

The CHAIRMAN said the resolution had not been seconded it fell to the ground.

Mr. MACFARLANE handed in the following notice of motion: “That at the future shows of this Society such steps be taken, and arrangements made, as will ensure the fullest consideration of an appeal made by any exhibitor against a decision on veterinary grounds.”

Mr. TOWNSEND mentioned that in the month of August last he brought under the notice of the Council the desirability of offering prizes for the best managed farms in the county or province in which the shows of the Society were held. This course had been adopted with great success in England, and could not fail to be useful if followed in this country. He moved the appointment of a committee to report whether it would be advisable to offer prizes as in England, how this could be best accomplished, and what steps should be taken to provide the necessary funds.

Mr. MACFARLANE said he had much pleasure in seconding the motion, believing as he did that this was a most valuable thing to accomplish. He also took additional interest in the matter, because he had received a letter from a friend who was disposed to give a prize for the most superiorly managed farm in the four counties with which he was identified. The gentleman in question wrote to him, to give him some outline as to how the prizes should be awarded.

The resolution was put from the chair and adopted, and the following gentlemen were appointed as a committee to draw up a report on the subject: The Rev. R. W. Bagot, Sir Allen Walsh, Bart., J. Robertson, D. Millward, E. Purdon, J. M. Royle, P. Riall, C. Cobbe, L. Cust, C. Cannon, H. J. MacFarlane, Colonel Vesey, and C. Uniacke Townsend.

On the motion of Mr. MacFarlane, seconded by Mr. D. Millward, a resolution of condolence was passed to the Duke of Leinster and his family on the death of his father, who had been most active in the administration of the Society, and for over sixteen years its President.

Mr. W. W. D. Pollard Urquhart, Kanturk, Castlepollard, was admitted a member of the Society.

THE TIP TREE LETTERS.

There is great scope for the profitable investment of capital in the reclamation of many millions of acres of waste land which now disgrace this wealthy country. In this neighbourhood much of the once barren heath has been converted into useful arable land. The Duke of Sutherland is most commendably reclaiming the vast wastes on his estate in Sutherland, and wisely using steam as the motive power. The non-use of steam power is a misfortune for British agriculture. It must ultimately become an important element of increased production and profit. In Scotland, where 300 years ago a law was passed to compel landowners to build a school in every parish, there has long been general education, and consequently steam power has there for very many years been appreciated and availed of in agriculture.—J. J. MECHI.

TO THE EDITOR OF THE MARK LANE EXPRESS.

SIR,—Mr. Mechi, in his wild letter in *The Times* of Tuesday, in his talk about the many millions of waste acres, merely *cuckoos* Odger. Again, it is notorious that steam is far less used in Scotland than in England. Ask any agricultural engine builder, and he will tell you there are a few fixed thrashing engines in the Lothians, but hardly a portable in all Scotland, where steam-ploughing is a long way behind England. The letter is intended to give the impression that English Agriculture has remained stationary, and is written to please outsiders and consumers.

Yours,

A MIDLANDER.

Permanent pasture employs a *minimum* of labour and capital, and is a great obstruction to the production of human food.—J. J. MECHI.

SIR,—I am renting a farm in Somerset, composed of 486 acres permanent pasture and 148 arable. The capital employed in farming it is £10,000; the manual labour during last year amounted to £1,143, and the human food produced was 60 tons of prime cheese and over 50 tons of pork, besides corn, which realised £711. There is nothing exceptionable in the land, nor was the season I have chronicled propitious, for in the spring the cows were suffering from foot-and-mouth disease (in consequence of which nine died), and the summer was far too dry for grass to abound on fairly stocked land. Whenever Mr. Mechi leads us into the green fields we cannot forbear a smile at his expense.

Yours,

Winchester.

J. STRATTON CHILCOMBE.

[In *The Times*.]

CONTAGIOUS DISEASES (ANIMALS) ACT.

Memorial forwarded by the local authority for the county of Norfolk to the Privy Council:—

To the Lords of Her Majesty's Most Honourable Privy Council.

The memorial of the Justices of the Peace, as the Local Authority for the County of Norfolk, in quarter sessions assembled, the 22nd October, 1874, sheweth.—That your memorialists are decidedly of opinion the costly experiment which has now been tried for upwards of twelve months in Great Britain, of attempting to stamp out pleuro-pneumonia by slaughter of all cattle found to be affected with that disease and compensating the owners, must certainly fail, unless such slaughter and compensation are extended to Ireland. That the county of Norfolk is the largest winter grazing county in England, and that the great majority of cattle there fed are imported direct from Ireland. That although Irish cattle generally arrive in an apparently healthy condition, several have been attacked with pleuro-pneumonia shortly after arrival; thus showing that the disease must have been contracted in Ireland, or upon the journey into Norfolk. That your memorialists are aware a rigid inspection of cattle coming from Ireland has recently been established at the ports of embarkation; but they are satisfied such inspection is powerless to prevent the exportation of a disease where the period of incubation extends to weeks, and sometimes to months. That your memorialists have good reason for believing that outbreaks of pleuro-pneumonia in Ireland are not in all cases reported to the authorities; and they are strengthened in that opinion by their own experience, previous to compensation being allowed, of the unwillingness of stockowners to give notice of the disease. That since the Animals (Amendment) Order of 1873 has been in force in this county, upwards of 1,200 cattle have been slaughtered by order of the inspectors of the local authority, in consequence of being afflicted with pleuro-pneumonia, but without in any way arresting the progress of the disease. The compensation payable to the owners of such cattle out of the county rate considerably exceeds £5,000. Your memorialists therefore pray that, in conformity with the unanimous recommendation of the select Committee of the House of Commons, compulsory slaughter with compensation for pleuro-pneumonia should be extended to Ireland, or, if that be found impracticable, that the Animals (Amendment) Order of 1873, as now in force in Great Britain, so far as relates to compulsory slaughter, should be at once rescinded.

DEATH OF DALESMAN.—Mr. Chaplin has just lost this well-known horse, at a time when he was becoming especially valuable. Daleman, bred by Baron Rothschild in 1863, was by King Tom, out of Agnes by Pantaloon. After a not very brilliant career on the turf he was purchased by Captain Barlow, in whose charge Daleman became distinguished in the show-ring, being, perhaps, the best horse for the purpose who ever won the Royal Agricultural Society's premium, as he did at Hull in 1873. At Manchester, however, Daleman had actually been put below such animals as Carbineer and Laughing Stock—an outrageous mistake, as we pointed out at the time, and of course he beat Carbineer at Hull, as we had predicted he must when they met again. Daleman was sold by Captain Barlow to Lord Spencer, who took him to Ireland, and then in turn to Mr. Chaplin, in whose possession he won at Hull. Daleman was himself a capital sample of the thoroughbred hunter, as the sire of some good hunting stock, while from very few blood mares there came Lowlander, one of the best race-horses of the day at heavy weights.

THE ASSESSMENT OF MINES.

In the Court of Queen's Bench, Westminster, before Justices Blackburn, Mellor, and Lush, an appeal was heard against the rating of South Caradon Mine by the Assessment Committee of the Liskeard Union. The appellants, who were represented by Mr. H. Lopes, Q.C., M.P., and Mr. Pinder, were Richard Kittow, Thomas Kittow, Christopher Childs, John Laurence, and John Raby; and they had been rated to the relief of the poor as the occupiers of surface land at South Caradon Mine, with the houses, buildings, machinery, tramways, and plant thereon. The rate having been objected to, the present case had been stated for the opinion of the Court. It seemed that by a deed made on the 6th May, 1862, the Rev. G. P. Norris and Mary Ann, his wife, the owners in fee of the land in question, granted to Richard Kittow and Thomas Kittow, and Peter Clyma, since deceased, power and authority to dig and search for metals and minerals throughout the land for a term of twenty-one years. The operations under that licence had been carried on by a company under the cost-book system; and the company had, in accordance with the provisions of the deed, erected houses, buildings, and sheds on the land, and fixed all the machinery and plant requisite for the general working of the mine. All the buildings were on the surface land, and this, together with the other land of the mine, formed the subject of the rate. The appellants were the surviving grantees under the deed, and shareholders of the company, of which Thomas Kittow was purser. The question to be decided was whether the appellants were occupiers of the property, and liable to be rated? Mr. Lopes contended that there was no occupation of the soil beyond what was actually necessary for working the mine; that there was no rateable occupation at all; that everything that was conveyed by the deed was a mere privilege or licence; that no exclusive occupation was intended to be given by it; and that if there was a rateable occupation, the appellants were not the occupiers. The deed conferred a mere incorporeal hereditament, and did not in any way deal with the actual soil. The appellants had not the exclusive possession of the houses and buildings which had been erected; and if they had, that would merely authorise the rating of the land on which they stood, and not the rating of the whole of the surface land of the mine. The grantors had actually reserved to themselves the power to drive adits and make water-courses within the very limits of the mine.

Mr. Justice Blackburn: None of which have, in fact, been acted upon.

Mr. Lopes contended that the substantial intention only of the deed must be regarded. Everything that was rated was subservient to the mine. Under the Act which would come into force in January next a mine, *qua* mine, would be no longer rated, but the dues or royalty; and the rate so assessed would be payable half by the occupier and half by the landlord. The Act also provided that the occupier was to be the pursuer, whose name should be on the rate-book, and expressly said that the dues being rateable, neither the surface nor anything appertaining to the mine should be rated. Assuming that the occupation in the present case was rateable, were the appellants the occupiers?

Mr. Justice Blackburn: If they are not, who are?

Mr. Lopes submitted that he was not compelled to show that.

His Lordship considered that doing so would be an important step in the case.

Mr. Lopes argued that neither of the appellants was in the occupation of the houses; they had no interest of any kind in the soil. The mine had probably been in existence for two thousand years, and up to the present time no rate had ever been levied upon it.

His Lordship: Then it is time that one should be put on. We will hear argument, but cannot be influenced by assertion.

Mr. Lopes had no intention to make an assertion which was not justified by the facts.

His Lordship, without calling upon Sir H. James, Q.C., and Mr. Poland, delivered judgment in favour of the Assessment Committee. A dictum of Mr. Justice Bailey had given rise to the idea that because a mine was not rateable the other things along with it were not. That was a mistake; and where there was an exclusive occupation of land, though it was for the purpose of assisting to work the mine, the land so occupied was rateable. He would assume in favour of the appellants that the deed itself contained nothing but a licence; nevertheless, *de facto*, those acting under it had been permitted to erect houses, buildings, sheds, steam-engines, and machinery, and to make tram and other roads. The appellants were in occupation of those things by their servants, and they were rateable for that at all events.

The other judges concurring, the appeal was dismissed.

THE PRICE OF SHEEP IN TASMANIA.—The sheep farmers of Tasmania seem to occupy the proud position of possessing the flocks to which the sheep farmers in the other colonies look for stud animals to improve their breeds. Our Gibsons, Taylors, Kermodes, Fields, Archers, and Tooseys, are names as familiar in the other colonies, in connection with the highest class breeds of sheep, as they are in Tasmania, and others of our sheep farmers are fast treading on their heels. The great suitability of our climate is being turned to the best account by a careful selection of pure stock, and an equally careful attention to their flocks, till the very fact of a sheep being Tasmanian imparts a certain additional value. We are led to make these remarks by the very satisfactory result, so far as yet ascertained, of a sale of pure sheep at Melbourne, that was looked forward to with considerable interest throughout Victoria, and even in the other colonies. An advertisement by Messrs. Powers, Rutherford and Co., the well-known auctioneers, occupied a column in the Melbourne papers with a list of high-class sheep entrusted to them for sale. Among the owners of stock advertised for sale, we find names well-known in Victoria, but the greater number were Tasmanian, including Messrs. W. Gibson and Son, James Gibson, W. H. Gibson, P. D. Toosey, W. Archer, Wm. Field, James Brock, Geo. Wilson, W. Doderly, and R. Jones. Our Melbourne correspondent's telegram informs us that Mr. William Field's pure Leicester ewes were sold at prices reaching up to £21 10s. We were shown a private telegram, received on Saturday, by the Hon. James Whyte, which stated prices received by Mr. James Gibson, unprecedented in the colonies. Mr. Gibson advertised "his far-famed stud, pure merino ram, 'Sir Thomas,' one of the grandest sires in the colonies, and in every respect a most perfect sheep." That Sir Thomas' qualifications were not over-stated was shown by the price realised. Seven hundred and fourteen pounds (£714) for one sheep! Mr. James Gibson also offered for sale 150 stud rams by Sir Thomas and Goldendrop, and other rams the progeny of Sir Thomas. The first 26 offered averaged £53 per head. One word as to the Scab Act. That piece of legislation has been found fault with as harsh and unjust. Perhaps it has made careless sheepowners pay for their carelessness, but had there been no Scab Act, would Sir Thomas have been allowed to enter Victoria, or, if allowed admission, how far would he have fallen short of £714?—*The Hobart Town Mercury*.

THE SHORTHORN SOCIETY.—Expression is just now being given to a very strong feeling of dissatisfaction at the treaty for the purchase of the *Herd Book* having fallen through; and it has been suggested that the new Society should forthwith make arrangements for publishing its own *Shorthorn Register*, in which, of course, there would be room for improvement on the present cumbersome system of preserving stock pedigrees.

A SATISFIED FARMER.

Having learned a trade in boyhood (though born on a farm near Boston) I worked at it until, in 1834, I then concluded to "go west" in search of better fortune. A journey of fifteen days brought me to Buffalo, and in the winter of 1835-6 I purchased 130 acres of land at 25 dollars per acre, which, as it was a time of general inflation, was regarded an extremely high price. I paid 500 dollars down, and borrowed money to make further payments in the spring. The farm was mostly woods, with a poor log house; about fifteen acres cleared and fenced, and about three miles from the village. Not a very inviting residence. I took possession in 1836; hired a man and set him to clearing, fencing, &c. During the following winter I got off some wood and timber. About this time the great bubble burst with a tremendous crash, and business all closed up. I waited patiently till the spring of 1838, but nothing turned up for me. I was not quite ready to encounter the cares of the new home, being all unacquainted with farm life, but after looking the subject squarely in the face, decided to make the attempt, though not without some doubt and mis-giving. But necessity overcame all objections, for which I have ever been thankful; and I proceeded at once to build a small shell of a house, 18 by 26 feet, enclosed with good sound matched boards, without plastering or paint. My wife contrived to paper neatly, with the various kinds of newspapers, which answered the double purpose of keeping the cold out and educating our children. We were now about to take possession of what we expected in due time, to make a comfortable home; yet under the circumstances, the outlook was not very encouraging. Our family consisted of myself, 44 years old, wife, 40, and five children—the eldest a daughter about 13, three sons and an infant daughter, not a very formidable force to begin with on a new farm. My capital was small, not exceeding 500 dols. cash; a credit always available when wanted; furniture sufficient to make us comfortable; strong, willing hands, and a young, growing family. I hired a man, took off my coat, and went to work in earnest. The year previous I had made some little progress in clearing, fencing, &c., which, by-the-way, cost 15 dols. to 20 dols. per acre. Our first available cash crop was 100 cords of wood, at 1 dol. 12 1/2c. per cent., and what little could be retailed in the village at 1 dol. 25c. Oak timber—but little, however, of that—at from 70 dols. to 80 dols. per cubic thousand; very little money in either after paying expenses. The first permanent improvement was a "bank" barn 40 by 100 feet, with stables under the whole. Next, a good substantial stone house, suitable for all purposes of comfort and convenience. In 1848 to 1850 I had paid up the first purchase and bought thirty acres adjoining, for which I was to pay 25 dols. per acre, which was paid in due time. About this time my eldest son became of age, and proposed looking for something better. He did so, and spent several months, and returned fully satisfied, and went to work with the understanding if the boys wanted farms our united efforts would be more available than separate. This was all the arrangement made with my sons, who were expected to remain at home and take their chance on the farm, and here commenced our co-operative farming. We then had four sons, the second studying for a profession; the third, fourteen years old, who was expected to remain on the farm. In 1852 and 1853 we had made good progress, and were getting on quite well. In August, 1853, we were checked by the burning of our barn, with all our wheat, hay and most of our farming tools. Here I would remark that, in addition to our former capital, a windfall came into the family of 2,000 dols., which assisted in rebuilding the barn, which we commenced at once on a more approved plan, 56 by 76 feet, with basement stables for some thirty head, and good root cellar. Now, as opportunity offered, from this time to 1857, we purchased 410 acres of land, for which we were to pay some 21,000 dollars. This for a time insured a tax of 3 dollars per day interest. The next purchase was a house and lot in the village, for 1,200 dollars; then a little more land that adjoined us, which we coveted and purchased; then, from 1861 to 1865, we bought 171 acres more, which cost about 11,000 dollars, and was the last purchase of real estate. In 1866 my sons were both

married. The younger settled in his new home, which cost about 7,000 dollars, and the eldest took possession, in the spring of 1867, of his building, estimated at about 10,000 dollars. It now became necessary to make a division, and we proceeded to do so, with the following result: The farm on which we commenced in 1838, contained 120 acres. Previous to our division we had sold 15 acres, for which we received an advance of about 700 dollars.

	Dollars.
We had added by purchase, 610 acres, making in all 740, for which we had.....	36,778
paid a fraction less than 50 dollars per acre	
Permanent improvements, buildings, &c. on homestead	7,000
For the first son married and settled about	7,000
For the other, in spring of 1867	10,000
Loss by fire	4,000
Educating two sons professionally	3,000
Two substitutes for army	1,400
House and lot in village	1,200
Stock and tools	4,600
Cash on hand, permanent improvements, &c. ...	4,500
Total	79,478

Now for the result as far as the boys are interested. They have performed their part faithfully and perseveringly to the end, and should be well paid. They leave for their new homes with good warranty deeds for 560 acres of choice land, with all fixtures and appurtenances thereto belonging, stock, tools, and well and handsomely located, worth at least 75,000 dols. If my sons, when they became of age, had wanted and obtained situations as clerks in some respectable, well-established business, they should have received for their services, each, 3,500 dols. per year, to have balanced their receipts from the farm, and then they would not have had comforts and privileges as at home, with few exceptions, besides the exposure and influence of city life, and probably been no better, if so well educated for the common business of life. Now let the boys who are looking forward to that end, remember that nothing really valuable can be obtained without well-directed, persevering effort, and that a well-developed brain is very essential to that end; that mother earth always pays liberally and promptly for well-direc'ed labour, and that seed-time and harvest have never failed. As the subject of temperance is being so fully and freely discussed, I will say that in early life I adopted the motto, "Taste not, touch not, the unclean thing." When I commenced farming, I was told that harvesting could not be done or a building raised without its use. I have, however, done all my harvesting, raised several large barns, some of them requiring the services of one hundred men, and carried out all our operations on the farm without its use, to the fullest extent. I am aware that some of my brother-farmers may be a little incredulous as regards my statements, without some further explanation. I would say that our forests were disappearing, so I was induced to purchase largely of heavy woodland, on which was a very good limestone quarry, suitable for building purposes and for lime, all of which we made available for both purposes. We converted some 400 or 500 acres of this timber into cord-wood, &c., and from 1854 to 1868 put into market from 1,000 to 1,500 cords yearly. We cleared and cultivated as we proceeded, and in so doing we kept as many men and teams as would pay all the time. Our winter crop was the most productive and profitable, yet the farm furnished the means and results, as before stated. Now, as I am about to bring my long, rambling story to a close, I will only add that in this record of my farming operations I have endeavoured to show results and not particulars, and that a good practical mechanic in middle life might change his business, if he has a desire and taste for farming, and in the end be successful. As a whole, he is better qualified, can plan, lay out, and execute better. I have raised good crops of the various kinds, and some not so good. In 1863 I had ninety acres of wheat which promised a large return, but after thrashing six days with ten-horse power, I got only 600 bushels. If the midge had let me alone

the first thrashing should have yielded more than 2,000 bushels. Here we were short 3,300 dollars. The straw from forty acres, seventy-three tons, sold for 730 dollars. But

similar losses happen alike to all, and who but farmers will feed the insects and birds?—*An Octogenarian, in the New England Farmer.*

THE AGRICULTURE OF ALGERIA.

One of the best of the French generals is now engaged in administering the affairs of Algeria, a country where soldiers in the highest grades of the army with doubtful politics, or suspected lack of zeal for the existing state of affairs, whether Orleanist, Republican, or Bonapartist, have been made to pass a period of honourable banishment. The sombre weird-like scenery, with the flitting Arabs and the life on the plains or hills, is said, however, to work a fascination upon all who have passed their time in African service; and to the influence upon the *morale* of the privates and officers whilst serving there was attributed some share in the disasters that recently befell the army of France. By competent observers it has been thought that the mission of colonisation has been fulfilled, and that sentiments too depreciatory of French occupation have been entertained. The restoration to civilisation of this former empire of the Mediterranean is a task worthy of a nation that is more than any other impressed with the desire to rival the great actions of antiquity.

The portion most favourable for cultivation stretches in a belt along the sea coast, and is protected from the intolerable heat of the desert by the ranges of the Lesser and Greater Atlas, whose sides are clothed with magnificent forests and their summits capped with snow. The Tell, as it is called, contains not less than thirty millions of acres, of which about ten to twelve millions are planted with the cereals. Here the principal markets are held, and the inhabitants of the interior resort thither at certain seasons of the year, to join in the harvesting of the grain, and to purchase or exchange their varied productions. The land, although very fertile, remains untilled in many places, for the want of settled occupiers, the natives being of a migratory character. It is usual to plough and sow in October, and if the rains fall in abundance during April a good crop is tolerably certain, and the harvest takes place at the end of May or the beginning of June. The plough is the same as that used in Spain and Provence, but not shod with iron; it is drawn by cows and asses, very rarely by horses, yet with such an imperfect implement the crops are generally excellent. When reaped, the grain is trodden out by cattle or horses, and after being cleaned, by throwing it up against the wind is deposited in subterranean caves or magazines. The wheat mostly grown is the *Triticum durum*, this hard wheat of Algeria being much esteemed in European markets for the manufacture of macaroni, vermicelli, and other *pâtes*: the gluten which forms the essential element for the transformation into macaroni exists in greater quantities than in that of other countries, even in that of Taganrog and Sicily. The variety of barley cultivated by the natives, and which the Europeans have adopted as the most productive, is the *Hordeum no-custicum*; but other kinds have been sown with success. There being no oats grown, it is used as food for mules and horses, but the poor classes eat it too: it is also grown as forage, either to be cut green, or made into hay. Algerian barley is well adapted for the manufacture of malt liquors.

Amongst the mountains of the Atlas, which extend to the interior and terminate in the Sahara, there are immense plateaux, where agriculture is an absolute impossibility, but the breeding of sheep supplies the colony with one of the great sources of wealth. Before the Conquest, the

Arabs reaped hardly any advantage from their flocks, save their own subsistence, as they were to a great extent cut off from a market on the sea coast by the rapacity of the intervening tribes. For some years after the Conquest, 2s. or 3s. was considered a fair price for a sheep; even five or six years ago, one could be purchased at the market near Algiers for from 9s. to 11s.; now a similar beast fetches from 16s. to 20s., and when sent to Paris by rapid steam transport it realises from 32s. to 40s.; and in summer more than 20,000 sheep are thus sent to France every month. The sheep are of two kinds: one small with a thick large tail, the other of much larger size, chiefly found in the country of the Getulæ. The fine Tunisian breed are not to be met with. The cattle usually are black; their milk is inferior to that of European cattle; that of the sheep and goats—the latter animals being numerous—is most used in making cheese and butter. The Arabs seldom diminish their flocks by killing them for food, but live on their milk and wool. The common beasts of burden are camels, dromedaries, asses, and mules. The horses are not always, nor even often of the pure Arab breed, not altogether well shaped, being lanky and round shouldered, small and not ill-formed, ear erect, and they are hardy, fleet, spirited, and docil. Those of Oran are considered the best: they are used for riding, and like the camels are reared and live in the tents with their masters.

The average head of cattle is a million and a-half. The cultivation of cereal crops will ever stand at the head of Algerian agriculture. There is a perpetual outlet for its superfluity. England alone would take what Algeria has to spare; and where these provinces made to rise to their utmost limits, they are believed capable of producing 220 million bushels of cereals annually. The French are at present making strenuous attempts to colonise, by offering inducements to the former residents of Alsace and Lorraine, and an exposition of industry has been projected to take place in the autumn of next year, that will prove a source of attraction to the visitors from other countries. The difficulties which the European population have to encounter in their dealings with the natives are almost insurmountable, and often result in uprisings and rebellions, which greatly retard the progress of the country. The habits of the Arab are such that being a man of pre-eminently few wants, he can well afford to sell his labour at a low figure, asking 1 f. 50 c. per day, when the European demands 2 f. 50 c. But the Arab's highest motive is avarice: he refuses himself substantial nourishment, the result of which is a visible failing of physical power. He is unable to continue any one kind of work which will require the consecutive employment of any single set of muscles for more than a couple of hours at a stretch; and unfortunately there is no combination of agricultural labour which will admit of constant change of occupation. His absolute ignorance also becomes a stumbling block to a proper execution of a task, as well as his unutterable laziness. By those who have seen him at work he is described as being awkward with the pick, more awkward with the hoe, whilst his habit of going barefoot effectually prevents his working with a spade. The plough he holds loosely with one hand, while with the other he goads the bulls, whose business it is to drag it over the soil. When we consider that the Arab's paradise is to bask in the sun, and smoke and wrangle, we

can well imagine to ourselves the labourer he makes. The European colonist must, therefore, turn watch-dog, and stand over his Arab labourer, if the task that he has

set himself to do in the restoration of the ancient border lands of Carthage can ever be made capable of accomplishment.

COUNTY BUSINESS AND COUNTY BOARDS.

At a meeting of the Winfrith Farmers' Club a very general opinion was expressed that "with regard to the landlord and tenant bill and various other subjects, such as local taxation and the malt-tax, differ as they might do thereon, they would not be fairly represented until they had a Minister of Agriculture." And at a meeting of the Norfolk Chamber of Agriculture, only two days afterwards, a strong majority, in a full meeting, was in favour of the establishment of County Boards, altogether apart from Quarter Sessions, "to manage matters relating to bridges, lunatics, weights and measures, with jurisdiction under the health act, and of course under the contagious diseases of animals act, as well as with the roads to look after." The resolution termed this a County Committee, but Mr. Sewell Read spoke directly to the more familiar title of a County Board for the administration of county rates.

There is a straightforward simplicity of action, as here recommended by the Norfolk Chamber, which comes in favourable contrast to the more fussy and less weighty proceedings of similar associations. In so many words, there should be county roads maintained by county rates, and managed by county committees, further empowered to undertake other matters, independent of magistrates' business, or, to put it plainly, out of magistrates' hands. And yet it is very doubtful whether this way of cutting the Gordian knot by the Alexander of Agriculture will have the approval of the Central Chamber, as clearly for this reason: the magistrates or landlords are at heart loath to lose any of their local power, and, as Mr. Hutchings puts it, "the Chambers are overshadowed and their freedom crushed by the influence of the landlords." There can be no possible mistake as to the position taken by the leaders of the county party. Mr. Henley, the very Mentor of the Commons, and long the chairman of a bench, has maintained that "they have managed their affairs very smoothly;" while Lord Hampton, the Telamachus of the Lords, has declared that "there is nothing to complain of in the internal management of the affairs of our counties, no extravagance, and no mismanagement;" Sir Mathew Ridley, that "the financial business in every county of England by a numerous body of gentlemen has long been performed to the advantage and satisfaction of the public," and so on. All this was said some years since, but it will be certainly interesting to hear now what Lord Hampton, Mr. Chaplin, and other heads of the school may say on their next appearance in Salisbury Square.

There was read, also some years since, at the Farmers' Club a paper advocating the establishment of County Boards, which was so far adopted by the Club that a copy of it was at once sent to every member of the Upper and Lower Houses; and in this a petition was quoted which went very much to say that which Mr. Read said in Norwich, as well as what some other people are saying all over the country. Thus, the petition served to show how "the amount of county taxation has very much increased;" how "taxation without representation is entirely at variance with the principles of a free constitution;" and, wherefore, "your honourable House will be pleased to enact a measure for the separation of the financial from the judicial duties of county justices, and to

appoint county finance boards, in which the ratepayers may be fairly represented, for the management of county finances." Mr. Read's advice or argument ran precisely in this course, but we think it will be found that he spoke more after the manner of the London Farmers' Club than the London Chamber of Agriculture.

At any rate here is an opportunity. No one who has studied any of these questions will care to deny that local taxation, the highways, and cattle diseases would be all the better for efficient, or in other words duly recognised local direction. We shall venture to assume that no farmer will dare to oppose any proposal for the establishment of County Boards; as on the other hand it will be good to see how many are prepared to openly support such a movement. Highway boards, Cattle-disease Committees and so forth will be very poor shifts or substitutes for that concentrated control, of which some people are already fightingshy. At a meeting of the Central Chamber in the Spring it was distinctly stated that since his accession to office, Mr. Sewell Read had thrown cold water on the cause, that he was muzzled, and so on. Since then the honourable gentleman has explained that he has been doing all he can to advance agriculture with the Government, and now he broaches, or revives a proposal which should be the very foundation of something more, as affording to the farmers more power and more representation. For this very reason we repeat the movement will be distasteful to many of the landlords who have either avoided or declared against it. Of course, we do not know whether the Chamber will go for County Boards on Tuesday, but if such a principle be avoided or smothered in mere verbiage, then Mr. Read to right himself should give notice of a distinct yea-or-nay motion on the subject, if only in order to ascertain who is now muzzled, who is throwing cold water on the cause, who is prepared to thoroughly support, carefully stay away, or sit tongue-tied under any county member's opposition to County Boards.

A report on a Government Department for Agriculture will be presented on Tuesday; but one should lead up to the other, and a central office without local machinery would be manifestly imperfect. Of course an Agricultural Department and a Minister of Agriculture, as talked of at the Winfrith Club, should mean much the same thing; but of late this has not been very becomingly put about. Since the site of the foreign market was selected the Government, whether as represented by Mr. Forster or the Duke of Richmond, or the staff, or, further, through the City of London, has never done anything right. Time even has not tempered the discomfiture, and in Dorsetshire but a week or so since the meeting heard how the Corporation paid a premium for the site of the London market to the proprietor of a skittle-alley, and how this man was a friend of the solicitor of the Admiralty. But then it is only human nature that people should be looking after premiums, and if the game of skittles was won it was probably lost. But this is scarcely the line to take over a Government Department. In any case the first and most available step should be towards the establishment of County Boards, as it is only to be hoped that the council of the Chamber will not feel it necessary to refer this matter to a Committee of Inquiry.

THE MAINTENANCE OF HIGHWAYS.

At a meeting on Monday of the Devon and Cornwall Chamber of Agriculture at Liskeard, the MAYOR in the chair, in introducing the subject, remarked upon the many questions connected with agriculture which required to be discussed, with a view to elicit opinions and arrive at the best conclusions. The subject of large and small farms was one of these. The exigencies of modern farming rendered improved implements necessary, and these were costly, and could be only afforded by those who farmed a large quantity of ground. On the other hand he often saw very large farms under very indifferent cultivation, large tracts of ground enclosed by hedges, it is true, but in a state very little better than sheep runs; and certainly it would be very much to the advantage of the community if these farms were cut in two. With respect to highways, they must have good roads; but the question was who was to pay for maintaining them, and how? Good roads were costly things, but they paid themselves in diminished horse-power required, and smaller saddlers', blacksmiths', and wheelwrights' bills.

Mr. HENRY STEEL (Bicton) in proposing the first resolution, said that the speedy abolition of turnpike trusts was a foregone conclusion. In many places it had already been done, others, like that of Liskeard, the trusts had been renewed for only a limited period—seven years. But it must be a wasteful system in which one-third the proceeds of the pikes were absorbed in cost of collection, and it was a great annoyance to be stopped every now and then to pay a small sum at a gate. Certainly such a system is quite opposed to the reforming spirit of the age. At present any district could join a highway board under the Acts of 1862 and 1864, and this had been very generally done, especially in the West of England. But he urged that they should be made universal and compulsory, and that as soon as possible. The cost of maintaining the roads has been certainly greater under highway boards than before, but the condition of the roads was infinitely better, and a few would like to return to the condition of things existing before 1862. The Highways Boards Acts were capable of amendment it was true, the system of audit should be improved, and the date of the expiry of the office of the waywardens should be made so co-terminous with the expiry of the financial year. But on the whole, they had worked so well that he desired to see them at once, if possible, supersede the turnpike trusts. He therefore moved—“That it is expedient that the remaining turnpike trusts be abolished as speedily as possible, and the formation of highway boards be made compulsory.”

Mr. S. ROSEVERE seconded the motion, pointing out the unfair way in which the system of turnpikes operated, and the waste which resulted from such a mode of collection.

Mr. LUSCOMBE opposed the resolution. He could not see what it mattered to the farmers what the cost of collection was so long as they had not to pay for it.

Mr. TREMAYNE, M.P., reminded the last speaker that when the amount raised by tolls did not suffice for the repair of the roads, the magistrates were empowered to raise a rate to supplement it; and in some places, St. Austell for instance, this was actually done.

Mr. N. ROSEVERE supported the resolution. He was able in his neighbourhood to use the turnpike road without paying toll; but this was not equitable to the public generally; and dealing with the matter on a broad principle a rate would be more just and advantageous.

The Rev. R. MARTIN, of Menheniot, pointed out that when the turnpike roads were thrown on the rates it would be very unfair to burden the parishes through which the turnpike roads happened to pass with the cost of maintaining them.

It was explained that under the scheme proposed by the Chamber the cost would be borne by a general rate, spread equally over the whole district.

Mr. TREMAYNE having given the motion his support, it was put and carried, with only three dissentients.

Mr. PRYN, of Callington, moved, “That there be only one class of roads (private roads excepted), and that all roads be maintained from the common fund raised by the highway boards, as at present constituted.” He urged that the work

of maintaining the roads could be carried out much better by highway boards than by county magistrates in quarter sessions. He did not see why the whole work could not be done with one staff of officials and surveyors and clerks, and he believed in the long run it would cost them less for rates than for turnpike tolls. They ought to look at the matter patriotically, as to what was best for the whole country and not for individuals.

Mr. G. DEWDNEY supported the motion, urging that it would be more economical and in every way beneficial that all the roads within every highway district should be under one staff and maintained from a common fund. He enforced his remarks by citing the experience of his own district, where they had taken over thirty miles of turnpike-road.

Mr. SOBRY explained the meaning of the motion, the wording of which he thought to be obscure.

Mr. PROUT urged that in the proposed taking over the turnpike-roads and throwing the burden of them on the rates, it should not be forgotten that many farms had been rented on the basis of the supposition that no such burden existed or would be placed on the farms, and a higher rent was paid in consequence of this immunity. To saddle such farms with additional cost would be unfair, unless allowance were made for it.

Mr. S. ROSEVERE had come to the conclusion that two distinct classes of roads should be maintained, and not all roads be merged into one class. On the chief roads thousands of persons travel who derive more benefit from those roads than the persons who would pay rates to support them. At the same time there was something in the argument that the repair of the roads could be effected more economically by one staff of officials than by two, and it had occurred to him that this might be done, and yet the payment of that repair be derived from different funds—one for the first class, and one for the second class roads.

Mr. N. STEPHENS said that it appeared to him to be a sound principle that “those who danced should pay the fiddler,” or, as in this case, that those who used the roads should pay for the use of them. Now the fairest way to do that would be to devote to the repair of the road a tax on carriages and horses—a graduated scale of taxes would be most equitable. But as the horse-tax had been abolished by Government, for which he was very sorry, he would apply to this purpose the tax on carriages, for certainly he did not see why those who had no vehicles, and did not use the roads, should contribute to their maintenance as much as those who did use them.

The motion was then put and carried, only two or three hands being raised against it.

Mr. PRATT, of Buckland, moved “That the funds now raised by licences on carriages be transferred to the county treasurer, in order that they may be distributed *pro rata* among the Highway Boards.” They had heard that the amount at present raised by taxes on carriages was £520,000. He contended that while Government received so substantial a sum as the result of taxes on carriages, the burden of the whole cost of maintaining the roads should not be borne by the rate-payers, but this half-a-million ought to be handed over for their relief. A tax on carriages he thought a very good tax, as it was a tax on luxuries—they saw many luxurious equipages rolling along their roads—as distinct from a tax on industry. Government, through Mr. Clare Read, had asked them as practical men to chalk out for them some way in which this great and important question should be dealt with. The council of the Devon and Cornwall Chamber had arrived at this in their solution of the difficulty; the Central Chamber had arrived at a different conclusion, but perhaps it might hereafter change its opinion, when they saw what the views of the country chambers were. It was felt at Callington, when this subject was last discussed, that if the highways were all transferred to the Boards, and maintained by rates, many who now paid for the roads, and who ought to pay, would be altogether relieved of the taxes. This would be remedied by the adoption of the proposal which he had the honour to move.

Mr. PROUT seconded the motion. He contended that if the tolls were removed, the assessed taxes on carriages should be devoted to the purposes to which the tolls were formerly

pnt. That, indeed, was the only way they had of getting hold of some persons who used the roads, and who did not pay rates. There were many lodgers, for instance, who took their drives in hired carriages, and how, except in that way, were they to be made to pay their share for the injury done to the roads? If assessed taxes on carriages were still paid, it was immaterial to those who paid whether the amount went to the repair of the roads or to the Government. They had been told that the taxes on carriages amounted to about a quarter of a million, and the total receipts of turnpikes to about two millions. Surely it was not too much for Government to pay them back from the imperial exchequer the quarter part of what the turnpikes had realised, and this was just what the taxes on carriages had produced.

Mr. STEPHENS asked what reason could be adduced for maintaining the tax on carriages which did not equally apply, maintaining the taxes on horses?

Mr. GROSER (Plymouth) had not intended to take part in the proceedings, but as a member of the sub-committee of the council which had drawn up these resolutions, it might be well that he should point some of the difficulties with which they had found the subject to be surrounded. It had been laid down as an axiom by Mr. Stephens that the user of a road should pay for its maintenance, and that therefore the assessed duties on carriages ought to be maintained and applied to the repair of roads. But who was the user of a road? Everyone was, in fact, a user for whose use anything was drawn over the roads. A householder, although he himself owned no vehicle, required supplies, say of coals. They were drawn for his use, not in his own carts, but in the vehicles of the coaldealer. But the consumer was really the user of the road, for he paid for the cartage and all the expenses attending on the cartage. If the cart in coming to him passed through a turnpike-gate the cost of traversing the turnpike-road was paid by the purchaser of the coals in the shape of tolls. If the turnpike-gate were abolished and the cost of the repair of the roads thrown on the rates, the consumer of the coals would still pay, not in the form of tolls, but in the form of rates. No assessed tax on carriages, therefore, was necessary to make him pay; but if there were an assessed tax on the cart that brought coals to him, although nominally paid by the dealer, the consumer would really pay it in the form of an enhanced price charged for his coals. So with all other commodities, although, perhaps, in a less marked degree. Again, it had been said by Mr. Prout that an assessed tax on carriages or turnpike tolls were necessary, in order to get at the lodger who rode out in hired vehicles, and did not pay rates. But surely that was not so. The livery-stable from which the lodger's vehicle was hired would be rated, and pay its quota for the repair of roads. The amount so paid as rates would increase the livery-stable

keeper's expenses, a fact he would be sure to remember when making his charge to the lodger for the use of the carriage. The same would be true, but not more true, of any payment in the form of assessed taxes. The user, be he ratepayer or lodger, would one way or another be "got at," and would pay his share. Again, Mr. Pratt had depreciated taxes on industries, and said that an assessed tax on carriages was a right one, because it was a tax on luxuries—the use of luxurious carriages on roads. But he (Mr. Groser) thought they would find that if they were to have roads kept up by the rates, assisted by taxes on vehicles, that vehicles used for industries must be taxed as well as others. He would illustrate what he meant by referring to the case of mines, although clay works or manufactories would be equally to the point. Supposing a mine were opened in the middle of a moor, and a tramway were made to convey material to and fro. Would they say that such a tramway, used for the enrichment of one set of adventurers, should be maintained from the highway rates? Of course not. If, instead of a tramway, a private road were made, still they would say that the cost of that road, cut up by the mine carts, should not be paid from the rates. But if the mine were started close to an existing highway already maintained from the rates, and it were cut up by the incessant cartage from the mine? What then? It would still be a public road, but it would be a road used to an excessive degree for the private benefit of one set of speculators, who would hope to realise a profit from the use of that public road for their own purposes. No ordinary assessment to the poor-rates would touch them adequately, for, perhaps, the mine would not be paying dues on which assessment could be levied. Some special form of taxation; perhaps an assessed tax on carriages would be necessary. But then the farmers must be prepared to have their own farm vehicles, which were at present exempt, taxed also, for they did the same thing, although perhaps in a less marked degree. Yet this would be a tax on industry, and undoubtedly in the abstract all taxes on locomotion were undesirable. It was a national advantage to have good roads, great arteries of communication, and Government might fairly be asked to assist by a contribution. Whether that contribution should be by continuing and making over an assessed tax on carriages for the purpose, or by making a direct *pro rata* grant from the imperial exchequer, derived from the ordinary sources, was a question of detail; he should, on the whole, prefer the latter. He apologised for speaking at so much length, but he desired to show that the matter was by no means a simple and easy one, which could be settled by a few axioms, and that other considerations were involved than those which appeared on the surface.

The motion was carried unanimously.

S T O C K S A L E S .

SHORTHORNS AND CLYDESDALES AT KEIR.

The property of Sir W. STIRLING MAXWELL, M.P.

BULLS.

Lord Errant, roan, calved 16th August, 1873, by Mr. Booth's Banner Bearer.—Sir W. Gordon Cumming, of Altyre, 63 gs.

Banner Keeper, roan, calved 16th Sept., 1873, by Mr. Booth's Banner Bearer.—Viscount Strathallan, 35 gs.

Fawsley, roan, calved 2nd Feb., 1874, by Keir Butterfly 9th.—Mr. A. Scott, Towie-Barclay, 61 gs.

Master Towneley, white, calved 24th Aug., 1873, by Keir Butterfly 9th.—Mr. Menzies, Tallochville, 34 gs.

Cherry Prince, red, calved 12th Jan., 1874, by Keir Butterfly 9th.—Mr. Fleming, Coates, 25 gs.

Dalzell, red, calved 22nd June, 1874, by Mr. Booth's Banner Bearer.—Mr. Currie, Halkerton, 38 gs.

Flower Lad, roan, calved 24th Dec., 1873, by Keir Butterfly 9th.—Mr. Michell, Greenyards, 28 gs.

HEIFERS.

Banner Lass, red and white, calved 3rd May, 1873, by Mr. Booth's Banner Bearer.—Mr. Cruickshank, Sittyton, 25 gs.

Lady Melville, red, calved 27th July, 1873, by Red Duke (29731).—Mr. Cruickshank, 38 gs.

Rose Flower, roan, calved 2nd Nov., 1873, by Mr. Booth's Banner Bearer.—Col. Williamson, of Lawers, 70 gs.

Isabella, roan, calved 10th Sept., 1873, by Mr. Booth's Banner Bearer.—Mr. Campbell, Kinnellar, 29 gs.

Banner Maid, red, calved 26th April, 1874, by Mr. Booth's Banner Bearer.—Mr. Cruickshank, 50 gs.

CLYDESDALES.

Bay filly, two years old, by Sir R. Bruce.—Col. Williamson 131 gs.

Brown filly, two years old, by Conqueror.—Mr. Riddell, Kilbowie, 55 gs.

Bay filly, one-year-old, by Mr. Riddell's Old Times.—Mr. Riddell, 82 gs.

Bay filly, one-year-old, by Prince of Wales or Old Times.—Mr. Riddell, 43 gs.

Brown filly, one-year-old, by Flower of Monteith.—Mr. Riddell, 35 gs.

Brown filly, foaled 22nd April, 1874, by the Keir horse Derby.—Mr. Campbell, 41 gs.

Bay filly, foaled 13th May, 1874, by the Keir horse Derby.—Mr. Whyte, Clinterty, by Aberdeen, 44 gs.

Brown filly, foaled 30th May, 1874, by the Keir prize horse Newstead.—Mr. Marr, Cairnbrogie, 47 gs.

Bay colt, foaled 27th April, 1873, by the Keir horse Newstead.—Mr. Riddell, 92 gs.

Bay colt, foaled 16th April, 1874, by the Keir horse Derby.—Mr. Smith, Castlemains, 61 gs.

Bay colt, foaled 19th May, 1874, by the Keir horse Derby.—Mr. Riddell, 30 gs.

Brown colt, foaled 6th May, 1874, by the Keir horse Derby.—Mr. Marr, 50 gs.

Brown colt, foaled 9th May, 1874, by the Keir prize horse Newstead.—Mr. Swan, Moat Mill, 31½ gs.

Grey filly, foaled 21st May, 1874, by the thorough-bred horse Mesmer.—Mr. W. Forrest, Allanton, 18 gs.

Sixty sheep, Leicester tup lambs, ranged from £1 to £4 15s.; average, £2 1s. 3d. 34 ewe lambs, in lots of two, brought from £1 to £4 15s.; average, £2 0s. 9d. 6 east ewes fetched from 17s 6d. to £2 7s. 6d. Two fancy black sheep (tup and ewe) brought £4 15s. each. A number of pigs from prize breeds sold at prices ranging from £1 10s. to £6 17s. 6d.

MR. MARR'S SHORTHORN BULLS AT UPPER-MILL, N.B.—The total proceeds of the sale amounted to £1,113, giving an average price for 31 animals of £35 18s., which is £6 1s. 6d. per head more than the prices of last year.

LORD CHESHAM'S SALE OF JERSEYS AT LATIMER, ON OCTOBER THE 29TH, BY SEDGWICK AND SON.—Lord Chesham has for many years paid great attention to the Jerseys as a dairy stock. Mr. Fowler

supplied good animals long since, and there were also purchasers at the sales of Mr. Selby Loundes, Mr. Dauncey, and Mr. Duncan's stocks. Lord Braybrooke, whose Jersey herd has been in existence for man's allotted three score years and ten, dipped into the Latimer by using Chesham, and a son of his went to Lord Dacre, who bred the Baron; this bull took first prizes at the Royals at Cardiff and Hull, and left some capital whole-coloured calves; but breeders were not for him, though his strength and masculine character would still make him useful as a stud bull. Mr. Wright, butcher bought him at 25gs. The cows were shown in a corner of the Park near the Dell Farm. Several were old and blemished and an impression prevailed they were a cull lot. Still on the whole there were some very good specimens, and they made respectable prices. The whole colour, which was a "French grey," was got by importing whole colours from the Island, but the produce came out with white marks, and Lord Chesham thinks the climate and soil had some influence. A portion only of the herd made a total of 833 guineas. There were 33 cows and heifer-calves, for which 744 guineas were realised. Of the other cows, Sunshine was purchased for 63 guineas for the foreign market, by Mr. Thornton, and Slender, by Mr. W. H. Smith, M.P., for 50 guineas, while Dormouse, one of the Dauncey's, now going out of fashion, made 40 gs. to the famous Mr. Mutton, of Brighton. In addition to the cows and heifers there were ten bulls and bull-calves, of which two were withdrawn. The other eight fetched but 89 guineas in all.

THE LAW OF DISTRAINT FOR RENT.

During a rather wild discussion down in Cornwall the other day on the tenure of land, two important points were touched on which do not often receive so much attention as they should do in any consideration of this now popular subject. Mr. Symons denounced the law of distraint for rent and advocated its abolition; and Mr. Grose said the system of tendering for farms was a very bad one, for as a rule, the landlords took the men who bid the highest prices. In Scotland, certainly, a movement against hypothec is forcing itself upon the legislature; and, as we said last week, here in England we suffer from hypothec at least in a degree, or, as Mr. Symons puts it, from the law of distraint for rent.

There can, indeed, be little question but that the indifference evinced by the majority of landowners and their agents as to any proposed improvement in the system of tenure may be traced to one or the other of these two causes. Were the prior claim for rent discountenanced, of course the practice of offering farms by tender would also drop through. One, in a word, depends on the other, as, however careless the landlord may be about the tenant's security, he is tolerably sure to keep a sharp eye on his own. With the law of distraint prevailing, the owner is naturally not so particular either as to the character or means of the occupier as he would be did he stand in the same share-and-share-alike position with other creditors. His guarantee under any altered state of things would be the actual ability in purse and person of the man with whom he treated, as it would be all to the higher of the contracting parties' interest that the other started on fair terms. This is so clear, that it becomes a question whether, as in Scotland, the movement in favour of the right to the tenant to his own investments and against the landlord's prior claim for rent should not be worked simultaneously? As it is, the applicant for a farm is pretty generally at the mercy of its proprietor, who, through his steward, dictates his own conditions; and "if you do not choose to take it, somebody else will." It is highly probable that somebody else, who is not so careful in looking to his premises, may be in no respect so desirable a tenant, although he will be ready to agree to anything. On such a showing he is too often accepted simply because the landowner is

ensured by the legislature against loss. If the new occupier continue to keep on so much the better, or if he fail he will not be allowed to go beyond his tether. An argument is occasionally offered that while the law of distraint exists a tenant will have more time to make use of the money, or as Mr. Major put it at Bodmin, "if the law of distraint were done away with my tenants would pay quarterly instead of yearly." The receipt, however, of a farm rent only once in the twelve months is surely very exceptional, if the payment of one half-year only when another is due be more common. Of course, such a plea as this—the use of another's capital—applies almost altogether to the needy man who would be swept away with its abolition as he has been if not created encouraged by the law of distraint. Under a more equitable and wholesome tenure the loan of half-a-year's rent should be no very weighty consideration, as the direct influence of any alteration would be the enlistment of men who could find their own money. As Mr. McNeel Caird said at the Scottish Chamber last week, "With the best tenant-farmers in Scotland, it is not the rent that troubles them; give them just security, do away with the artificial hindrances which hamper their industry, and they will not quarrel with the rent." In a word, we should by removing these artificial hindrances establish a better class of tenants and a better system of farming.

In a strictly commercial sense nothing could sound much worse than the law as it now stands. Men get into possession of farms mainly because they are willing to make bad bargains, and the owner and the occupier play a game at chances. But the risk here is not equal; for the landlord is playing with the money of other people, as he pays himself in full first out of a pool to which others have contributed, so soon as the tenant cannot put down his own stake. This game is called the Law of Distraint: while in another variety of the same amusement one of the players stakes his money without any rule which will ensure him a fair opportunity of ever getting it back again. And this game is known as Blind Confidence. In fact, in either case the landlord takes a very similar position to that of the Emperor of China, who when he

sits down to whist exercises the privilege of never naming trumps until he has seen his hand.

Palpably there are great difficulties in the way of any reform here; as nothing would promise to create more indignation, either in the House of Commons or at the Chamber of Agriculture, than any proposal for the abolition of the law of distraint. The tenant-right cry is

terrible enough in a landlord's ear, but the very mention of any tampering with his prior claim would be something overwhelming. Still we do not despair of his being educated up to the one or the other; and as Scotland is fast following us on the way to a tenant-right, so must we watch her attack on the abuses of hypothec.

BARLEY OR WHEAT MALT.

A very remarkable change is about to take place in the history of agriculture, consequent on the change in the value of English wheat and barley. This may be partly owing to a deficient crop of barley, but still more to the total inadequacy of other sources of supply. On the other hand, the importations of wheat have been so liberal, and our own crop also so large, that the best red wheat is selling below the best malting barley, the one being quoted at 48s., and the other at 46s. per qr. Formerly the relative normal value of barley seldom exceeded two-thirds that of wheat, and it must have been a bad crop indeed that would bring the two products near upon a par, or change to any large extent their relative values on the market. Such, however, are the transpositions produced by, first, the increase of the population, and secondly, the duty-free importations of all kinds of articles of consumption. Amongst these the new market prices of wheat and barley are in every respect the most remarkable, when we consider the *intrinsic* value of each, and that the open market of the whole world furnishes supplies. Such, however, is the scarcity of malting barley, that, with all our sources of supply from both the old and new worlds, so great is the increased demand for beer, that our brewers are again using enormous amounts of sugar or molasses as the readiest and most economic article offering itself.

But the mere 2s. per qr. plus on barley does not represent all the difference between the actual relative values of the two products. The weight of the best red wheat may be reckoned at 64lbs. per bushel whilst that of the best barley is no more than 57lbs. making a difference of 7lbs. per bushel, or 56lbs. per qr., which, if the weight of the wheat is assimilated to that of the barley, will reduce the value of the one to the extent of 6s.—that is, 456lbs. of wheat sell for only 38s. per qr., whilst the same weight of the best barley fetches 48s.—an anomaly in commerce which never occurred until the present season.

There is, however, another question to be considered in the matter—namely, the materials of which the two products are composed, and how near the quality of wheat-malt approaches to that of barley-malt. This is a most important part of the subject, and one that can only be solved by experiment and chemical analysis. The amount of saccharine matters is greater, we believe, in wheat than in barley, and the specific gravity is greater. If such be correct, a denser kind of liquor will be the result, and, therefore, a greater facility of producing intoxication; but this is partly conjecture, which, perhaps, some of our readers may be able to confirm or confute. We have certainly no reliable data to enable us to give an opinion on this part of the subject; still, it is important, because on the quality of the product in beer, and the quantity a certain proportion of wheat-malt may yield of given strength, depend any continued use; as, of course, there is further the flavour to be considered.

We have started this question, because in France a good deal of wheat-malt has already been made, and the maltsters appear to be going into the trade rather largely;

some also in our own country, whilst wheat is so low and barley so high in price, are disposed to try it. The question then remains, Is it probable or possible that wheat will continue at so low or barley relatively at so high a price as to enable the maltsters to use wheat for barley? This is a matter which only time can determine, but towards the solution of which we may throw out a few hints. First, it is tolerably certain that the growers of barley abroad are large competitors for producing the best malting barley; and secondly, it is as certain that the United Kingdom cannot, either at home or abroad, supply one-half of the demands of her own breweries. Thirdly, can the cultivation of barley at home be increased by substituting that grain for wheat or other grain? Fourthly, is the importation of foreign wheat likely to continue and increase? and are the cultivators and merchants of Russia and America so satisfied both with present prices, and with the certain prospect of a market for any amount they may have to spare, so as to induce them to cultivate wheat expressly for the English market at all times and under any fluctuating in price?

The last query would look to be very easily answered. The value of land in those two countries is small, and readily attainable, while the cultivation of wheat, the principal produce, is grown in so primitive a manner, that there is always an excess of the home demand; and since England has become a customer to be depended on, the supply of wheat has, from the United States, been increased in proportion to the expected demand. In both Russia and the United States, however, a good deal depends upon the charges for carrying the grain to the ports; especially is this the case in America, where during the last year some of the railways charged the value of two bushels for the conveyance of one bushel to the nearest shipping port.

CASTLE-DOUGLAS HORSE FAIR.—The show of horses numbered about 200, and was the finest that has been seen at Castle-Douglas at a Martinmas fair for many years. Good horses were in fair demand, but inferior were difficult to sell, and brought prices from 3 to 5 per cent. lower than those current at the Rood Fair. Few farmers were seeking horses, and the most of the business done was among dealers. Messrs. R. and A. Johnstone showed a splendid stud of 60, and sold 30. They sold a beautiful four-year-old, purchased from Mr. Hunter, Leathis, to Mr. H. Crawford, at £110; two to Mr. Carselaw, Mearns, at £190; a mare at £70 to Sir Wm. Maxwell, of Cardross; a two-year-old colt to Mr. Brown, Ingleson, at £80; a horse at £95 to Mr. Yuille, Glasgow; and upwards of twenty others at from £10 to £75. Mr. T. Currie disposed of the whole of his stud of seventeen. He bought a grey mare from Mr. Rigg, Banks, at £140, which he resold to Mr. Thomas Clark, Mearns, at £150. He sold a two-year-old colt at £65, a chesnut mare to Mr. Riddell, Kilbowie, at £85, three to Mr. John Brown, Biggar, at £70 each, a one-year-old filly to Mr. John Crawford, Beith, at £43; and others at lower prices. Mr. M. Teenan had also a fine string of draught and harness-horses, and sold a number at prices similar to the above.

THE MANCHESTER AND SALFORD FAT STOCK SHOW.
IN THE POMONA GARDENS.

With a fat stock show already established in Manchester just about Christmas time, it is a question whether this earlier exhibition was ever required, as certainly the result does not say much for the experiment so far. In many of the leading features of such a meeting it was a most unmistakable failure. There were in all eight Herefords entered to compete in five classes, and these were so generally indifferent that not one first prize was awarded; and the judges consequently refused to admit of such a thing as a "best Hereford." There were in all three Devons entered, and in the outset the management proposed to throw over these classes altogether by returning the exhibitors their fees, but eventually the animals were allowed to come on, when Mr. Senior's ox, which has now been knocking about the country for the last two years, won. In fact, amongst the cattle the only creditable display centred over the Shorthorns and the Scotch or Scotch crosses. Messrs. Freshney, from Lincolnshire, made their mark with a Shorthorn ox, bred by Mr. Wells, of Withern, which was not only the best of his class, and the best Shorthorn but the best of all the oxen or steers; the actual awards in his class being strengthened by commendations to Mr. E. J. Howard, Nocton Rise, Lincoln; Mr. A. H. Browne, Doxford, Chathill, Northumberland; and Mr. Thomas Elliott, Hindhope, Jedburgh. Only one commendation, to Mr. J. H. Stephenson, was appended to the three prizes in the three-year-old class; while the open class of cows included two or three well-known show animals, Mr. Wells' cow now beating Moss Rose, as we contended she should have done at Northampton; but Mr. Wright's heifer, first at Northampton, was first again here, as she has also been in Lincolnshire, and, as we have written of her, always sure to be heard of in good company. There was a fair show of polled Scots, with Messrs. Martins' ox as the champion; but only two or three Highlanders and a good specimen of the Shorthorn and Poll cross shown by Mr. Adamson from Alford, backed by Mr. Statter's cross-bred cow, pronounced to be the best cow or heifer in the show.

There were only two exhibitors of Southdown sheep, two of Oxford's, none of Hampshires, and none of Lincolns. Lord Walsingham took all the three prizes against his veteran opponent Lord Sondes, who was highly commended for both pens; while the Merton flock will not be represented at Birmingham, as the extra premiums for Southdowns have this year been struck out of the Bingley Hall list. A solitary ewe did duty for the Cotswolds, but there was really a respectable entry—as things went here—of Shropshires, where Lord Chesham was still invincible, although Mrs. Beach was so close up that a referee had to be called in. The competition in the pig classes was often very limited, noticeably enough one of the best filled being that of Berkshires, which seem to be taking root in Lancashire and Cheshire.

There were further premiums for corn and roots, with an exhibition of implements, often enough of an almost ludicrously "miscellaneous" description.

PRIZE LIST

JUDGES.—R. Woods, Osberton, Worksop; W. Cropper, Minting House, Horncastle; F. Lythall, Offchurch, Leamington; T. H. Hutchinson, Manor House, Catterick; T. Dodds, Wakefield; J. Lynn, Stroxton, Grantham; J. Fisher, Carrhead, Leeds; W. Lort, King's Norton; B. Baxter, Elslack Hall, Skipton; H. V. Grantham, West

Keal Hall, Spilsby; J. Downham, Bury; W. Hewett, Chester; J. Bradley, Leeds; J. Hicken, Dunchurch, Rugby; R. T. Smith, Whitechurch; T. Rigby, Winsford, Cheshire; A. Mills, Heywood; R. Tait, Manchester.

CATTLE.

HEREFORDS.

Ox or steer of any age exceeding three years and three months old.—First prize, withheld; second, £10, S. Miller, The Court, Abernule; third, £5, R. Everall, Woolston Hall, Leeboetwood.

Steer, not exceeding three years and three months old.—First prize, withheld; second, £10, R. Heighway, Lea Cross, Shrewsbury; third, £5, R. Wortley, Aylsham.

Steer, not exceeding two years and six months old.—First prize, withheld; second, £10, R. Heighway.

Heifers.—Third prize, £5, R. Wortley.

SHORTHORNS.

Oxen or steers of any age exceeding three years and three months.—First prize, £50, T. and J. B. Freshney, Saltfleet, Louth; second, £10, T. Lund, Monk Bar, York; third, £5, T. H. Ferris, Manningford, Marlborough.

Steer, not exceeding three years and three months old.—First prize, £20, R. Wortley, Aylsham; second, £10, E. Wortley, Ridlington; third, J. Outhwaite, Baines.

Steer, not exceeding four years old, bred and fed by a tenant-farmer.—First prize, £15, J. Cran, Kirkton, Laveress; second, £10, J. Nicholson, Willoughton Grange, Kirkton-in-Lindsey; third, £5, J. Nicholson.

Cows.—First prize, £15, Earl of Faversham; second, £10, W. T. Wells, Withern Hall, Alford, Lincolnshire; third, £5, O. Bennion, Cresswell, Stafford.

Heifers.—First prize, £15, R. Wright, Nocton Heath, Lincoln; second, £10, T. Statter, Stand; third, £5, E. Liddell, Morris Hall, Northam, Northumberland.

DEVONS.

Cup, 50 guineas, for best Devon, T. L. Senior, Aylesbury; second prize, £10, R. H. Harris, Earnhill, Forres, N.B.

Cows or heifers.—Second prize, £10, T. L. Senior.

SCOTCH BREEDS.

Polled oxen or steers of any age.—First prize, £50, J. and W. Martin, New Market, Aberdeen; second, £10, Sir W. G. Gordon Cumming, Altyne Towers.

West Highland oxen or steers.—First prize, £20, and second, £10, T. Statter.

Cows or heifers.—First prize, £15, Sir W. C. Trevelyan; second, £5, T. L. M. Cartwright, Melville House, Lady bank, Fife.

PURE-BREEDS AND CROSS-BRED ANIMALS.

Oxen.—First prize, £50, H. D. Adamson, Balquhorne, Alford, Aberdeenshire; second, £10, T. L. Senior.

Fat steers under three years old.—First prize, £20, W. M. Combie, M.P., Tillyfour, Aberdeen; second, £10, J. Cron, Kirkton.

Fat cows or heifers.—First prize, £20, T. Statter; second, £10, J. and W. Martin, New Market, Aberdeen.

EXTRA STOCK.—Bull, cow, or heifer, of any age, breed, or variety, and not necessary to be fat stock.—First prize, £10, G. Fox, Hare Field, Wilmslow (Leenan); second, £5, and third, £3, T. Statter.

Cup of 50 gs. for best ox or steer, Messrs. Freshney (Shorthorn).

Cup of 50 gs. for best cow or heifer, Mr. Statter (cross).

SHEEP.

Cheviot wethers, three years old.—First prize, £15, Th Duke of Roxburgh; second, £10, J. McGill, Rotchill, Dumfries.

Cheviot wethers, not exceeding twenty-three months old.—First prize, £10, R. H. Dwire, Barney Mains, Haddington, N.B.; second, J. McGill.

Southdown wethers, not exceeding twenty-three months old.—First, second, and third prizes, Lord Walsingham.

Shropshire wethers, not exceeding twenty-three months old.—First prize, £15, Lord Chesham; second, Sarah Beach; third, F. Bach, Craven Arms, Salop.

Shropshire wether.—First prize, Lord Chesham.

Pen of three fat Oxfordshire wethers.—First and second prizes, G. Street, Maulden, Amptill; third, N. Stilgoe, Aderbury, Oxon.

Sheep not qualified to compete in other classes.—First prize, W. and G. Bird, Taunton; second, The Duke of Portland.

Cross Breeds: Pen of three fat wethers.—First prize, J. Christie, Whittingham, West Morris, Haddington; second, N. Stilgoe.

Cotswold ewe.—Silver medal, J. Wheeler, Long Compton, Shipston-on-Stour.

Southdown ewe.—Silver medal, Lord Sondes, Elmham.

S. Iroshire Ewe.—Silver medal, S. Beach.

Ewes of any pure breed.—Silver medal, R. H. Harris, Earnhill, Forres Border (Border Leicester.)

PIGS.

For the best collection of breeding pigs.—Champion cup, the Earl of Ellesmere, whose pens obtained 119 points, against Mr. P. Eden's pen of 117 points.

Large breed: Pen of five pigs of one litter, exceeding three and not exceeding six months old.—First prize, £10, and second, £5, P. Eden.

Pigs of the middle breed, five of one litter, exceeding three and not exceeding six months.—First prize, £10, P. Eden.

For collection of breeding pigs, being the *bona fide* property of the exhibitor.—A cup, value 25 gs., the Earl of Ellesmere.

Pen of three fat pigs of one litter, not exceeding ten months old.—Prize, £10, P. Eden, Cross-lane, Salford.

Pen of three fat pigs of one litter, not exceeding 15 months old.—First prize, £10, and second, £5 P. Eden.

Fat pig, exceeding 15 months old.—First prize, £6, the Earl of Ellesmere; second, £4, Colonel C. Towneley, Towneley, Burnley.

Breeding pigs of the Berkshire breed: pen of five pigs of one litter, exceeding three and not exceeding six months old.—First prize, £10, H. Hamfrey, Kingsthorpe Farm, Shrevenham-Berks; second, £5, J. Wheeler, Long Compton, Shipston-on-Stour; third, £3, A. Stewart, St. Bridge, near Gloucester.

LAND TENURE.

At a meeting of the Cornwall Chamber of Agriculture held in Bodmin, Sir Colman Rashleigh, Bart., M.P., who was voted to the chair, announced that he had received letters from John St. Aubyn, Bart., M.P., Mr. John Tremayne, M.P., and Mr. Jonathan Rashleigh, expressing regret at inability to attend. Mr. Tremayne added—"It is a subject to which the attention of Parliament will shortly be drawn; and it would have been an advantage to me to have heard the opinion of my constituents." He (the chairman) agreed with his colleague in thinking that the subject, and in fact the whole question of land, was one which must occupy the attention of Parliament very shortly—probably in the coming session; and he also fully agreed in thinking it was one on which it was desirable that he should hear the opinions of his constituents. He was glad that the matter had been taken up by such an able agriculturist as Mr. Oliver, but he would not yet express an opinion in regard to it. He should be very sorry to make up his mind, or to declare prematurely his opinions on such an important matter as the subject of land—not only the tenure of land, but the transfer of land and the present laws relating to the land. They were matters, in his opinion, requiring the greatest possible consideration, especially at the hands of those who had the honour of representing the large landed interests of the country. He should listen to the remarks made that day, and from the remarks made there and elsewhere he should make up his mind as to what course to take as their member of Parliament; but it would be wrong and premature for him to express any opinion at all until he had heard the subject talked over and argued out.

Mr. OLIVER read the following paper: Few questions are of greater importance than this which I have chosen for your consideration, and designated *The Tenure of Land*. This question, which has been so frequently ventilated of late, is evidently in a very unsatisfactory state; a circumstance to be universally regretted, since wills resulting therefrom are not confined to landlords and tenants, but extend to the community at large. "The first condition in every State is the plough," and something must be wrong in any State, particularly one possessing abundance of capital, if it cannot be profitably employed in cultivating a fertile soil like that of Great Britain, while so much inferior food is annually imported from abroad to feed its inhabitants. Such, however, is the state of this country at present. One cause of the commiserable condition of agriculture, when compared with other industrial pursuits in this country, is undoubtedly the undue burdens laid on the landed interest in the shape of rates and taxes, which ought to have been considerably reduced when the Corn-laws were repealed and the British agriculturist had to meet "all comers" with his hands tied. In the absence of that relief, however, a great stimulus would be given to agricultural progress by an understanding between landlord and tenant, calculated to afford security to capital invested in improving the land; since many capitalists, now that agricul-

ture is become such a fashionable occupation, would readily invest in cultivating land belonging to other people, having no opportunity to purchase; but they are generally too shrewd to do so without security, feeling that the profits arising from agriculture would be small under the most favourable circumstances. Much has been said here from time to time respecting the legal points affecting this question; I will not, therefore, waste your time by dilating on them, nor in taking you back to that primitive state of agriculture when occupiers of land had nothing to offer the owners but suit and service; but will as briefly as possible, with the view of promoting discussion, point out some of the many inconsistencies connected with the tenure of land. *Landowners*.—The first persons to be mentioned are landlords, by which I mean extensive owners of land; and amongst them, like mankind in general, there are good, bad, and indifferent, varying in character and position. Some do their duty in the station it has pleased God to place them, by taking an interest in their own affairs and trying to make all with whom they are associated prosperous and happy, remembering that "Property has its duties as well as its rights;" while others appear to treat those matters with indifference. Some are wealthy and affluent, while others are poor; consequently, incapable of doing the good they would. But life is uncertain with all; hence the necessity of preparing for these changes which death might produce, when another Pharaoh might come in who knew not Joseph. The place of the first-mentioned worthy might be filled by some well-meaning, but arrogant military officer, taking no interest in rural affairs and expecting the same amount of homage from his tenantry as he has been accustomed to receive from the troops under his command, which must lead to unpleasantness, and probably impede the progress of agriculture without previous security of tenure. *Leases*.—Leases are generally provided for the purpose of security or protecting the interest of both landlord and tenant in Cornwall, but unfortunately many of them are ill-adapted to the age in which we live, being in many instances mere copies, with slight alterations, of those made by lawyers, having no knowledge of agriculture, perhaps centuries ago. I once heard the principal clerk in an attorney's office say that he had frequently pointed out to his employers the inconsistency of these leases, but the reply he invariably received was, "If we make alterations we shall probably make mistakes; so it is better to let matters remain as they are." Each tenant was therefore expected to sign and pay for this antiquated document, irrespective of the character and situation of the farm; and I fear that such cases are not uncommon in this enlightened age. Lease making under these circumstances is very profitable to the lawyer, and I know of no other reason why men of straw are so frequently taken as tenants in preference to men of capital. It is true the former sometimes offer more, and fictitiously augment the rent-roll while they rack the farm. Lawyers are qualified to receive rents and draw leases, but not

to lay down rules for the management of farms; that should be submitted to a practical land agent. Now a practical land agent is a very important personage in connection with this question. He should have a thorough knowledge of agriculture, the construction of farm buildings, and the draining of land. Tenants would not then be required to adopt systems of cultivation in the fickle, humid climate of Cornwall which would be suitable to the dry Midland and Eastern Counties; buildings would be more judiciously constructed on some domains, and drains would not be made so shallow under his supervision as to become choked with the roots of vegetables. Land agents should be affable in manner, so that tenants might at all times make known their complaints; and possess sufficient independence to decide justly any disputed question that might arise between landlord and tenant. We have many such men in Cornwall: would that we had more. My observations are not, however, confined to this county. Wherever such men are in office, I invariably find liberal landlords and improving tenantry; but when empirical tyrants occupy this important position the reverse is generally the case. "Birds of a feather flock together." Agriculture is not so profitable an occupation as to enable the farmer to stand up against oppression; on the contrary, it is so precarious as to require great forbearance and encouragement. Many enterprising tenants have sustained such losses through adverse seasons at the commencement of a term, that they would have been ruined had it not been for the kind forbearance of their landlord, brought about by the instrumentality of a confidential land steward. *The letting and holding of land.*—There are different modes of letting land in this country. The first I would mention is one frequently adopted in various parts of this kingdom, where landowners look upon their tenants as members of their family, and transmit to them the land occupied by their ancestors at a fair yearly rent, adopting the motto, "Live and let live." No comment is required on this happy state of things. I envy the parties concerned. Yearly tenancy, however, in the general acceptance of the term, subject to six months' notice to quit, is objectionable even when the tenant is allowed for unexhausted improvements; as when this uncertainty exists men are not so likely to effect improvements as when they have a long term under a lease. Besides, where that system prevails, parties frequently take farms for the express purpose of getting what they can out of them, and leaving at the end of a year or two—a system pernicious in its effects, and one that ought to be discouraged. Yearly tenancy is not without its advantages, however, over a lease, when a person for the sake of convenience takes a farm that does not suit him, which frequently occurs. The system which I have long advocated for the occupation of land is a liberal progressive lease, with compensation on quitting for unexhausted improvements, by which I mean such improvements as are calculated to enhance the renting value of the farm, at which no landowner can justly complain. When farms are offered to be let for a term of years I strongly recommend that the rent be named: the system of letting by tender is objectionable in many respects, as persons frequently offer rents which they never intend to pay, and when they get possession stipulate for a lower sum than was offered by a more deserving tenant, and one that owner would have preferred. Others through ignorance offer rent beyond the value of the farm, which places the land agent in an awkward position, the temptation being too great for many landowners. Moreover young farmers become discouraged by this unjust and undue competition, and seek other occupations at home or abroad.—*Leases:* Many clauses in existing leases are prejudicial to the interest of landlords, tenants, and the community at large. The first I shall mention is that prohibiting the sale of hay and straw, and other produce of the land; this might have been produced prior to the introduction of artificial manures and railways. One can hardly suppose that the intelligent landowners of Cornwall will now stand so much in their own light, as to allow the vast number of horses employed in this county, where abundance of hay, straw, and roots are grown to be supplied with fodder and litter from other counties. Can they be ignorant of the fact that land in populous districts where tenants are at liberty to sell these commodities lets at higher rent in consequence, while with few exceptions the landlords of Cornwall prohibit their sale. How often does one see near a railway station ricks of straw rotting in the field, the residue of which is not worth 10s. a ton as a manure, while it could readily be disposed of at 50s.

a ton. No agriculturist knowing his business will now cultivate land without manuring it, and manure is abundant. In order then that land may fetch the maximum rent, or yield the greatest amount of produce, those absurd restrictions must be removed from leases, its occupiers be at liberty to buy in the cheapest market and sell in the dearest. Restrictions in the cultivation of land should be few, as seasons will beat any man's judgment, but tenants should be amenable to landlords on quitting farms. Some leases, although apparently liberal, are subtle and delusive. A circumstance came to my knowledge a few years since where a tenant was simply bound to farm according to the rules of good husbandry, but subject to a fine of £10 an acre if he failed to do so. In consequence of the land being over-run with rabbits, unpleasantness arose between the tenant and keeper, so that the tenant decided on quitting the farm, when, in accordance with his lease he was charged £200 for the mismanagement of 10 acres of land which had become foul through rabbits destroying his cultivated crops. A more daring attempt of might to over-charge right never came under my notice. The tenant, however, successfully resisted it, though at considerable expense. The accursed vermin, rabbits, have caused more discord between landlords and tenants, and have been a greater bane to agricultural progress than all other things. My object in reading this paper is to show that a long lease with compensation for the tenant on quitting, is calculated to afford greater security for invested capital than a yearly tenancy. It is not intended, however, that this lease shall interfere with existing laws affecting the interest of landlord and tenant or those that may in future be enacted, any clause in a lease contrary to these laws should be ineffectual. For instance, no clause should prevent tenants from destroying hares and rabbits, as they by law belong to him. I have avoided touching those questions so ably introduced at this Chamber by my friend Mr. Snell, cordially agreeing with him, that the proposed Landlord and Tenant Acts will not be worth the paper it is printed on if the twelfth clause be struck out. Many minor questions respecting leases might be considered, but I greatly prefer having the opinions of gentlemen present so capable of expressing them, and with these brief remarks I conclude.

The CHAIRMAN saw present the land-steward to Sir Charles Sawle—Mr Stokes—whom he should be glad to hear.

Mr. STOKES said that in his unfortunate profession he got many kicks and no half-pence. He never granted a lease without consulting his land-agent, and then going through the points which related to the particular farm. There were now, however, many lawyers who studied agriculture, and were good farmers. He did not believe they would ever get the landlords of that county to do without leases; for though there was no doubt that the tenants were honourable men, who might be trusted implicitly, yet he had known tenants who could not be trusted. He believed in many leases there were clauses which were unnecessary, and which were never carried into effect. The words, "according to the rules of good husbandry," were very vague, and only lately he had occasion to re-open the question and decide what those rules were. He believed there were now very few yearly leases. He would like a little information concerning the disposal of hay and grass. Where there were good landlords covenants were not of much use.

Mr. OLVER said the more liberal the covenants under which land was let the greater would be the rent. Straw might often be disposed of to the advantage of the tenant, who might pay a higher rent, and be allowed to accommodate neighbours who wanted straw. When they saw the immense quantity of manure which was carried back to replace the straw that had been taken away, they could not but think the change was a profitable one. A lease should be a practical lease, and a lawyer without any knowledge on the subject was not the person to draw up a lease. Two years before a tenant left a farm certain conditions should be agreed on, so that the incoming tenant should have something on the farm when he came.

Mr. ALLANSON thought that in popular questions like this the majority was not always correct, for people were often led by zeal without discretion, selfishness without reference to justice, and a jumping to conclusions without analysis. He believed that they had not so much to complain of as they thought, for in the past forty years he had seen more instances where the landlord had cause to complain of the tenant than

the tenant had of the landlord, though he did know of a few cases where there had been injustice on the part of the landlord. Leases were not intended to be carried out, and it was a difficult thing to get a fair, common-sense lease. If the leases did not interfere with them as tenant-farmers, they ought to be satisfied. There was a good deal of moonshine and sentimental work connected with the question. The tenant-farmers of Cornwall were not worse than the yeomen. That showed they were good farmers. He believed that, as a body, they were satisfied with the landlords, who for the most part were just men. During thirty or forty years he had known a few run from their word; but if they were to have a change in consequence of this, he might as well have a legal document in every transaction he had. He believed that nineteen out of twenty had no fear of their landlords acting dishonourably towards them. If they had a 90 years' lease he believed they would not farm better than they did now, nor would they farm better than they did now if they had a lease made out to their own liking. He was, therefore, at a loss to see what change was wanted. The six months' notice to quit was, he confessed, a mere farce. When they talked about Tenant-Right he believed that it would be a long time before they saw a measure which would be satisfactory to landlord and tenant. If the bills that had been submitted to Parliament were passed he believed there would be no end of litigation. By the late bills they could take money from a good tenant, but, if he were a bad farmer, they could get nothing from him. The land which was good 40 years ago was good now, and the bad was still bad; the surface might be improved or deteriorated, but the subsoil would remain the same. He believed that the tenants as a body had confidence in their landlords, who were fair men.

Mr. HENRY SYMONDS denounced the law of distraint, and advocated its abolition. He wanted to know why there were leases at all, if, as was said, they were virtually nullities.

Mr. MAGOR said, so far as he was concerned as a landowner, he should be willing to do away with the law of distraint if his tenants would pay him quarterly instead of yearly. He believed in a long take. He advocated the union of landlord and tenant in endeavouring to secure good cottages for the labourers, and to give them a good education, which would make them not mere machines, but men of good sense, who would know how to work their way through life. The tenant-farmer was not sufficiently secured. A man, when he went out of a business had money paid him for the goodwill, but the farmer had not. He believed in the tenant receiving compensation for unexhausted improvements. There was a difficulty in the way, but it might be managed by arbitrators being appointed by a board of agriculture.

Mr. WESLEY GROSE was at a loss to know what man would be such a thundering fool as to invest his capital in land if he had not got a lease. Two-thirds of the nonsense in the leases should be left out. The lawyers should write half as much as they did now, and charge half the price.

Mr. COLLINGS denied that lawyers were actuated solely by money-making motives. He could not believe that what was taken away in the shape of hay and straw from a farm would be compensated by the return of manure.

Mr. GROSE said the system of tendering for farms was a very bad one. As a rule the landowners took the men who bid the highest prices.

Votes of thanks were passed to Mr. Olver and to the Chairman.

MR. SEVELL READ'S BUDGET.

Mr. C. S. Read, M.P., has just addressed his constituents at the Market Tea, Diss.

Mr. READ said that the kind reception which he had met with that evening showed him that he had not forfeited the confidence of his constituents. It was, he thought, a great compliment to the tenant-farmers of Norfolk that one of their number should be in the Ministry. Some of his kind friends had said that they had not heard so much of him lately in Parliament, or seen his name so often in print; perhaps he was like the old lady's parrot, which when it did not talk was considered to be thinking all the more. If he had not spoken very much in the House of Commons, he had voted much more frequently than he had ever done before. He had voted some 130 or 140 times during the past session; this was double the number of times he had ever voted before in any one year, although he had always been a tolerably attentive member. He had made a calculation, and he found that he had to traverse eight miles in order to vote 140 times, and the voting also occupied some 35 hours, so that his time had been well and properly spent. The late hours of the House and the work of the days were, in fact, more than he had bargained for. He once read a tale of a man whose hair became white in the course of the night. One Session had turned his own hair iron-grey; and he believed that if he went on for another Session he should find his health rather worse than it was at present. However, a good heart would carry him through. He had no Government secrets to communicate, for the best of all reasons—that he did not know any. As regarded the next Session, he did not think that there would be anything sensational in the legislation attempted. Should a Bill be introduced to give legislative protection to the capital of the tenant, he was quite sure that the just rights and interests of the landlord would be properly regarded, although this was not the case with the Irish Land Bill. He believed, however, that there would next Session be a useful amount of what might be termed domestic legislation, which really was very much wanted. Sir Henry James told his constituents the other day, at Tannington, that the Conservatives were not good administrators, and that even in regard to a Turpinke Bill, the Liberals would conduct it with greater precision, and a much better style, than the Conservatives. However, as such matters were generally arranged by the permanent officials, he did not

think that there would be much difference found in the conduct of business either by the Conservatives or the Liberals. As he could not talk much about the future, perhaps he might be allowed to say a word or two on the past, and he thought that the most important matter of the Session was the Budget. Now, if he had been the Chancellor of the Exchequer—and perhaps it was fortunate for the country that he was not—the sort of Budget which he had sketched out for himself was somewhat like this: He should have repealed half the Malt-tax, and by this the country might have lost £3,500,000 in the first year, perhaps not so much in the second year, while the remission of taxation might have recouped itself in time; but then, if he had done this, he should not have repealed the Sugar duties, and the repeal of those duties was a wise and beneficial measure, for the public were hardly aware of the extent of the restrictions which those duties imposed upon traders and merchants. As far as regards local taxation, he should have done exactly what the Chancellor of the Exchequer actually proposed. He should have left a jolly good surplus to be dealt with as might be deemed expedient next year; but he feared that taxpayers objected to pay taxes merely to make a surplus, and it must be remembered that a Chancellor of the Exchequer was always badgered from morning till night by deputations anxious to have a share of any surplus which might exist. He should have taken the duty of tradesmen's horses, as horses were just as necessary to tradesmen in their trades as for those engaged in agriculture, but he did not know that he should have repealed the tax upon hunters or racehorses. With regard to game, he should have exempted a gun used by a farmer, whether he carried it himself or lent it to his servant, for the purpose of securing his crops. With regard to dogs, he thought it would be a very good thing indeed if shepherds' dogs and dogs of a really useful character were exempted from taxation, but pleasure dogs ought to be doubly taxed; but he feared that all these ideas of his were quite contrary to the spirit of the age, and that they would not hold water in the House of Commons for one moment. It was therefore, perhaps, fortunate that he was not Chancellor of the Exchequer, because, if he had been, he should have destroyed his party, while he did not know that he should have pleased anybody. He was quite sure that a budget like that which he had sketched out would not have passed the House of Commons. When he told the Central Chamber of

Agriculture that budgets were made, not to please or even to do justice to his political friends, but to pass the House of Commons, he was rather roughly handled; but he contended that a Chancellor of the Exchequer must propose a budget which would pass the House of Commons, and the present Chancellor of the Exchequer had proposed a Budget which seemed to please the country generally. It must be remembered that in 1852 Mr. Disraeli proposed to repeal the Malt-tax, and the consequence was that Mr. Disraeli was turned out of office. If Mr. Disraeli could not obtain his object just after the Free-trade system commenced, when the price of Barley was much lower than it was at present, and when promises had been made in abundance about the repeal of the Malt-tax, just after the impost duty on wheat had been taken off, how could it be possibly expected that the repeal of the Malt-tax could be carried now, when the price of barley was lower than wheat, and when people had forgotten all about the promises which they had made when a one-sided Free-trade policy was introduced? Another reason why the repeal of the Malt-tax could not be obtained was that most of the members were against it; the brewers, with the noble exception of Mr. Bass, were against it; and it must be remembered that there were 40 members of the House of Commons who were directly or indirectly connected with brewing. Then there was a formidable body of teetotal gentlemen, or supporters of the Alliance, who fancied that, were beer made cheap and pure, there would be more drunkenness. Perhaps he might be asked why, if he held these views, did he not vote with Mr. Fielden and his 17 followers? His (Mr. Read's) hon. colleague, Sir R. J. Buxton, was the seventeenth of the supporters of Mr. Fielden; and he (Mr. Read) should have made the eighteenth, only he happened to be in the Government, and he could not vote for an amendment to the Budget of the Government of which he was a member. As Col. Bartelot, who was the leader of the Malt-tax repealers in the House of Commons, actually voted with the Government, he (Mr. Read) thought that he had a very good excuse and justification for walking out of the House. The farmers must let the Malt-tax question stand over until the next election. The farmers started two hares, or, rather, two horses—one the repeal of the Malt-tax, and the other the remission of Local Taxation, and the Chancellor of the Exchequer had chosen a remission of Local Taxation, and had thereby pleased the country. He (Mr. Read) contended further that although the Budget might not be popular among farmers, still it was a plain, straightforward, and honest Budget. There were no feats of legerdemain about it, there were no five quarters brought into one year's revenue, no making the tax-payer pay taxes in advance so as to make a surplus, and no local process in regard to over-estimates of revenue or under-estimates of expenditure. The Budget of Sir Stafford Northcote was, in fact, an honest and honourable one, and upon the whole the best which could have been introduced by the Conservative Government. At a meeting of the Norfolk Chamber of Agriculture he let fall a few words about county boards, when it was actually supposed that he was inspired by the Government to feel the pulse of the country on that question; and it was also said that he was a convert to county Parliaments. Those who knew him must be aware that long before he entered Parliament he was in favour of county boards. He advocated them not for the purpose of interfering with the magistrates, who generally managed matters in quarter sessions economically and well; but what he wanted to see was a good representative county authority, which should be the medium of making local self Government more a reality than at present, and for the purpose of checking the tyranny of the central authority. New boards were constantly being created, and new power conferred upon the central authority. This he greatly deprecated, and he would have a good county board to resist this central power and to make refractory districts do their duty to themselves and to the country. Of highway districts, he reminded them he was not authorised to say anything, but by the abolition of the turnpikes and the throwing of the expenses of that maintenance of roads upon the parishes, a great hardship had arisen. In that part of the country they did not like the idea of having highway boards; but he was sorry to say the Central Chamber of Agriculture thought differently, for two to one voted in favour of a resolution that highway boards should be made

compulsory. If it should be the duty of the Government to introduce a Highway Bill he would do his best to make it a good one. There must be some alteration, and although he had his ideas on the subject, if he found himself in a minority he would not stand tenaciously out for the adoption of his view, but try to produce the best legislation possible. He never could understand why, especially in rural districts, there was any necessity to have a new board; for why should not the guardians act as way-wardens? There was a clerk and other officials, except perhaps a surveyor; but some people said the relieving officers would make good surveyors, and he believed they would make as good surveyors as some that had been appointed.

THE RABBIT IN DEVON.

Mr. Benjamin Butter Bastin, of Tidwell Barton, East Budleigh, writes: Will you permit me to give a fair description of the case which was brought before the Woodbury magistrates on Monday last. Robert Edwards has been in my service as shepherd for nearly six years, and I can give him a good character for industry, honesty, steadiness, and truthfulness. He has a family of five children, and a wife daily expecting an increase. On Sunday, Oct. 25, having three colts and some calves at the higher ground, it was his daily duty to feed them with corn. On his return, walking in the public road, he heard a rabbit cry. The two sheep dogs, which were more than fifty yards a-head, had caught it and were pulling it in pieces. He put it in his pocket, with the intention of informing me of it, which he did on my return in the evening. The rabbit was about six weeks old, and mangled. I told him to throw it away, and thought no more of it. Of course it would not do to allow dogs to eat rabbits, for fear of their learning to kill lambs; but on Monday Edwards received an "invitation" to Woodbury. The magistrates convicted him, but I feel quite positive he was not trying to kill rabbits. Now, I wish to let the public—the consumers—know why the tenant-farmer is wishing for some legislative protection. Eleven years since I took this farm in a perfect state of ruin. All the fences down; with a large portion of the ground ploughed seven years before, and still lying in rough furrows full of weeds, &c. I had nearly every fence on the estate made, but now they are just like a honey-comb with rabbit burrows. There are many thousands of rabbits on my farm at the present time, and to prove this, I will quote only the damage done to my crops this season, for which the Hon. Mark Roile will have to compensate me. The damage was valued by his own steward and bailiff—Messrs. Lipscombe and Sanders—and they awarded me for damage done to corn alone, £120, being something like 400 bushels of wheat, at 6s. per bushel. In some fields as much as 20 bushels per acre were destroyed. This sum awarded is only for what they term "excessive" damage, as by a clause in my agreement, that is all I am entitled to claim. A large amount of damage done to my root crops still remains to be valued. Close to where this unfortunate rabbit was killed, whole fields of turnips, &c., are entirely destroyed—not one single root left to tell the tale! The damage, valued at harvest, is only the one visible; but the larger amount is done when the corn and roots are in their infant state, and one rabbit will eat and destroy hundreds of turnips and mangolds in a single night. A rabbit eats and destroys 5s. worth before it is worth 1s. In the grass fields, where I have daily to keep my sheep to eat what little remains, the damage cannot be estimated. Having a young family around me, I think it better to hope the first loss will be the least, and consequently have given six months' notice to quit, which I do at Lady-day, considering myself driven from house and home by rabbits. I cannot work and lose my capital to preserve rabbits for the hon. baroness to make a market of. She sends the keeper to take off a few hundreds of the thickest of them now and then for market, allowing the others to breed again till the number is made up. William Lake and his donkey cart can be daily seen returning from Bieton with his load of rabbits to sell in the neighbourhood. The tenant is expected to witness all this with humble submission, to cultivate his farm, pay his rent, breed and feed rabbits, and be overlooked by such a keeper as the one who gave evidence in this case. He has been on my premises only twice; each time in a state of apparent intoxication, and very abusive. Since I

have given notice the hon. baroness, no doubt, seeing the question of the rabbits is assuming an important position, has issued the following notice to the tenants:

East Budleigh, B. Salternon, Oct. 9, 1874.

Dear Sir,—I am directed by Mr. Rolle to say that Lady Rolle will give permission to the tenants on her South Devon property to kill rabbits on their respective farms, between the hours of sunrise and sunset, with ferret and bag nets. The permission is limited to the farmers and members of their families resident on their farms.

Yours truly,

R. H. LIFSCOMB.

Of course this permission is quite useless on many estates as the vermin are in cover by day, and over the land by night. By this wonderfully gracious concession—the Baroness seems to class the tenant-farmer with respectable rat-catchers, as if their time is not more valuable than wasting it under the hedges with ferrets and nets. Some time since, after killing many hundreds on my farm, her ladyship kindly sent me twelve as a present; but not seeing it in that light, I directed the keeper to take them back, and say I did not like insult added to injury, and I wished her ladyship a good market with them.

MR. HOPE'S SEWAGE FARM.

In the Court of Exchequer, before the Lord Chief Baron and Barons Cleasby and Aphlett, the cases of Hope and the Romford Board of Health came on. Actions were brought by Mr. Hope against the Board for non-fulfilment of contract in not supplying a sufficient quantity of sewage to Breton's Farm, which he had rented from the defendants, and by the Board against Mr. Hope for the recovery of the rent of the said farm.

Mr. Murphy, Q.C., and Mr. Charles appeared for Mr. Hope; and Mr. Prentice, Q.C., and Mr. Charles Hall were for the Romford Board of Health.

Mr. Prentice stated that there was an action brought by the Board to recover the rent, as it was called, for the sewage upon the plea of eviction. He contended from several dates he could produce, that the negligence imputed to the Board in the cross-action occurred after the rent was due. So far as he could see, the first action was undefended; and the real question between the parties arose in the cross-action. The first count in the declaration was substantially that after the making of their demise the defendants did not supply, afford, or deliver into the possession of the plaintiff all the sewage of the town of Romford. The second count was upon an implied covenant that the Board would get the necessary work performed to connect certain houses in the district with the sewer. On the 16th May, 1870, the defendants covenanted with the plaintiff that they would do all works necessary to cause, and would cause, all the sewage of the town of Romford which was capable of flowing by gravitation into a certain outfall sewer. The plaintiff alleges a breach of this contract. The question was whether, from the deed, any such covenant was to be implied. At the time the lease was granted there was an outfall sewer constructed to a place called Breton's Farm and a reservoir, and a great number of houses in Romford drained into the sewer. The Local Board demised and leased to Mr. Hope "all the sewage of the town of Romford, or such part thereof as shall flow by gravitation into the outfall sewer which now conducts the sewage into the tanks or reservoir constructed" on Breton Farm. There were a great many other covenants in the lease on the part of Mr. Hope as to how he should farm the land and so on; and there was a clause to the effect that if any of the covenants were broken the lease was to be at an end. The only covenant on the part of the Board which the Arbitrator had found in some instances to be broken was one relating to the pumping from the low levels of the town. He had found that either from the boilers being out of order or from a change in the engineer, that on some occasions when the water was being pumped from the reservoir to the farm some of the sewage escaped.

The Lord Chief Baron: We have no damages to assess.

Mr. Prentice: You have to decide upon what principle the damages are to be assessed. At the sitting at Nisi Prius it was decided that if the Court should be of opinion that Mr. Hope had any claim, then the Court was to determine the principle upon which the damages were to be assessed. If there was negligence on the part of some of the servants of the Board causing some portion of the sewage to go into the brook instead of on to the farm, then the Board would be liable for that, but that was scarcely worth discussion. The main question was whether there was really, as was alleged, on the part of the Board, a covenant which would imply that they were to cause the inhabitants to drain into the outfall sewer. He might mention that the plaintiff was aware before the lease

was executed that many of the houses in Romford did not drain into the sewer.

The Lord Chief Baron asked what the works were Mr. Hope contended the Board ought to have done, and which they had not done.

Mr. Murphy said that there was a demise on the part of the Board to Mr. Hope that it was possible for them, by connecting the existing houses with the existing sewers, as they were bound to do by Act of Parliament, to allow the whole of the sewage to pass by gravitation into the outfall sewer, which had not been done.

The Lord Chief Baron asked what was the provision of the Act of Parliament that conferred the power upon the Board, and which imposed upon them such obligation.

Mr. Murphy then minutely entered into the circumstances of the case, and dealt with the clauses of the lease. He contended that there was a demise of the whole drainage to Mr. Hope, and that the insertion of the words in the covenant, "or such part thereof as shall flow by gravitation" was only made by the Board for the purpose of protecting themselves against the necessity of putting such machinery in operation as would be requisite to pump the water from the low-lying portion of the town to such a level as would enable it to flow into the outfall sewer. By the Public Health Act the Board was bound to cause such sewers as may be necessary for the effectual draining of their district, and if the owners of houses refuse or neglect to connect their houses with these sewers, then the Board has power to do so and to charge the owners with the expense, and the Sanitary Act of 1866 provides that if the Board omit to put in force the powers vested in them complaint may be made to the Secretary of State, who, upon finding that the authority of the Board has not been carried out, may appoint some one to do so. The Utilisation of Sewage Act, 1867, provided for the disposal of sewage by Local Boards. Before the passing of this Act the sewage was discharged into the river at Romford, and in 1868 an injunction in Chancery was made restraining the Board from so disposing of it. In consequence of this injunction the Board issued an advertisement dealing with the whole of the sewage of the district and then the lease was executed. Looking at the position of the various parties in this matter, what was the fair construction to be put upon the lease? He could show from the lease that Mr. Hope would have been bound to take and dispose of the whole of the sewage in question. The construction put upon the lease by his learned friend (Mr. Prentice) came to this, that the Board would give Mr. Hope as much or as little sewage as they pleased and that he would nevertheless be bound to give them £600—the whole of the rent. He contended that the Board was bound to give Mr. Hope the whole of the sewage of the district.

The Lord Chief Baron again asked what the Board were bound to do and what they had failed to do.

Mr. Murphy said that there were several houses which could have been connected with the outfall sewer, and that no such connexion had been made. At the time Mr. Hope took possession of the farm he knew that a number of houses in the district were not connected with sewers discharging by gravitation into the outfall sewer, but he trusted the Board would put their power in force and connect these houses with the sewers, but made no further inquiry and acquired no further information as to what had been done, or omitted to be done, at execution of the lease. That being the position of parties, Mr. Hope thought that the Board was bound by the Sewage Utilisation Act to give him the whole of the sewage. Sup-

posing the Board, acting perfectly honestly, had connected two-thirds of the houses that drained at that time into the outfall, Mr. Hope, according to their construction of the lease, would have been bound to pay the whole of the £600, and would have had no remedy given to him.

Mr. Baron Cleasby said that it was a usual thing for drainage works such as those in question to go wrong occasionally, and for drains to cease to flow sometimes for a period of several days.

Mr. Murphy said that assuming they did Mr. Hope would still be deprived of something which he had been promised, and it would still be a matter for compensation. The rent of £600 must have been fixed on some basis, such as, say, 2s. per head of the inhabitants, and it surely could not be intended by the Board that Mr. Hope was to pay the same rent for a small number as for a large number of houses. He did not put it as an implied, but as an express covenant that the Board was to grant the whole of the sewage of the town of Romford to Mr. Hope, and that had not been done. As to the action for rent, he would ask, Was this a demise of sewage, or a sale of sewage, or what was it? It was analagous, he thought, to a grant or a right of porting over land where there had been a suspension of the right granted; and upon the finding of the arbitrator there had been an abstraction in August, September, and October, 1873, of the thing they had bargained to give him.

Mr. Prentice said he quite agreed that by reason of negli-

gence in one or two instances the sewage did not go on to the farm.

The Lord Chief Baron: You do not deny there should be a verdict.

Mr. Prentice: I do not.

After some further argument,

The Lord Chief Baron proceeded to give judgment. In doing so he said there was no principle involved in the matter of damages assessed. The only question was, what Was the value of the sewage Mr. Hope had not received? If the Board had the means of connecting some 20 or 30 or 40 houses to an outfall sewer and had neglected to do so, they were guilty of a dereliction of duty. It was perfectly clear to him that there was no pretence for arguing or suggesting that by the covenant the Board was bound to put in force the powers invested in them by Act of Parliament to compel all the inhabitants to cause their sewage to run into the outfall sewer. The Court must give judgment for the plaintiffs—the Local Board—in the one action to recover the rent or sums of money in question; and judgment for the plaintiff (Mr. Hope) in the other action to recover such damages as the arbitrator may award in respect of a partial failure in the quantity of sewage supplied.

The other learned Judges added a few remarks substantially concurring in the judgment given by the Lord Chief Baron.

This is virtually a verdict in favour of the Board.

STAINDROP FARMERS' CLUB.

THE BREEDING OF SHORTHORNS.

At the last meeting a paper on Cattle Breeding was read by Mr. George Hedley, of Newcastle-upon-Tyne; Mr. W. T. Scarth, president of the Club, in the chair.

Mr. G. HEDLEY said: It is difficult at this advanced era in the history of agriculture to hit upon a subject to bring before a farmers' club that may be considered at once interesting and instructive. I therefore avail myself of a suggestion made by your secretary some time ago, that this paper should be something about cattle breeding or cattle feeding, partly, I presume, because this is the district where the common country cow first graduated into the beautiful and ornate Shorthorn, and partly because the traditional fires of the improver of that most useful race of domestic animals still burn with considerable ardour in the hearts of the farmers around. It is now upwards of ten years since I addressed anything to the public about cattle, and that was then done in an essay, entitled, "The Origin and Progress of Cattle," and after that some letter on judging by points, first sent to *The North British Agriculturist*. They were then bound together in pamphlet form, and had a very large sale both in Great Britain and in some parts of Ireland. They were largely quoted from in America, and, I believe, had the effect of laying down a basis for a system of judging Shorthorns by points in some parts of that country. The latter portion of the pamphlet—namely, that about judging by points—has never been much accredited in England, and in a great measure, I should say, because it was not when published fully elaborated and discussed. I should, therefore, be pleased if you would look upon this paper as a continuation of the whole subject, which I shall endeavour to treat with all the brevity and completeness possible, although I trust you will bear in mind that, as it embraces a wide field for thought, it cannot really be done justice to, in a very few words. When we look around and take into account the fabulous sums of money obtained for Shorthorned cattle at some sales of late, it is apt to occur to us that they resemble more the disposal of galleries of highly-renowned pictures or celebrated pieces of sculpture at the Academies of Art, than that of ruminating animals, whose breath is only in their nostrils. And to carry the simile further, while a Titians or a Turner, a Phidias or a Thorvaldsen, may bring thousands of pounds, a David or a Cooper, a Spencer or a Lough, may go for an old song. So is it with cattle, while the Bates' and the Booth's are carried off at any money, the Townley's and the Torr's, lacking, perhaps, the pure strains of the former all through ten generations or more, may be picked up at the common price, simply because they are not the fashion. Their fame is not consolidated through a long series of

years. It is not cosmopolitan, and it is not ascertained that a bad resultant might not crop out, though the ancestor possessing the inherited feature or features condemned might be sixty years dead. Is this not carrying the art of cattle breeding much too far into the regions of romance? You may preserve your Titiens or your Turners on your walls untarnished and untouched, but you cannot preserve your Bates or your Booth, or rather your Bates or your Booth forms without the genius of a Bates or a Booth. The former are imitable facts, accomplished and preservable, the latter are living facts, which must be carried forward and perpetuated, otherwise they will soon cease to exist in their commendable and much-admired outlines. A very ardent student may give 5,000 guineas for a Bates bull and cow, but it does not follow that they are intrinsically worth the quarter of that money, or that they may even throw him a calf that could be fairly said to be of the value of £50—that is, if symmetry, substance, and beauty are to be the guide. The bull and cow might have very little natural affinity for each other, and hence the blood would not mingle or harmonise. It is worthless, I contend, to have a herd of Bates or Booth animals without some of the wisdom of a Bates or a Booth to guide them. No doubt exists that some few herds of those two distinct strains have continued to keep up the good characteristics of their respective names. But how many out of the whole number have failed? A very large proportion I must say. The reason is not far to seek. The few have had at their heads men with an intuitive knowledge of how to marry the sires and dams without a loss of the vital forces and the harmony of the outward features. The many have gone on haphazardly without knowing the particular types of recognised beauty, and the likes and dislikes of certain strains of blood for other strains. The success of those two splendid herds referred to may be attributed to three causes—firstly, the wonderful powers for recognising strength and beauty in animal structures possessed by the owners; secondly, the long time those powers were exercised on two herds and in one direction; and, thirdly, a consanguineous cross which, as far as we can gather, was practised upon both. To stamp a type nothing is so potential as a consanguineous cross. It cannot be neutralised or eliminated in a short space of time, and Messrs. Bates and Booth were the kind of men who knew when to do it—namely, at the period when their herds had attained that perfection of form and vigour of constitution so long desired. You can only go a very short way in that direction however, and no doubt it would be done by them for one desideratum alone—namely, to create a oneness in the general

features of their animals. If all the branches of those two noble families of cattle had sprung from two or three roots, the distinctive peculiarities of strength and beauty could not have been long sustained; for although they now come under the designation of two great names, they are derived from various sources all drawn in and wisely engrafted by the powers that then presided. Nothing is so fatal to a herd as a succession of close crossing. Nothing is so difficult to manage as wide crossing; hence my reason for claiming for successful Shorthorn breeders the genius of an art. The man who has not an eye to form, a knowledge of the laws that govern physiology, and some power of appreciating the elective affinities, had better let Shorthorn breeding alone. I know a family who have used Booth bulls for upwards of twenty years, and have never made a single mark of any importance, simply because they did not happen to have an eye for beauty of form. I have the acquaintance of a gentleman who is famous for his correct estimation of animal symmetry, and also of weight and colour, but who missed his way from being at the very head of the Shorthorn kingdom by not having the courage to give his herd a consanguineous cross. In this, I think, was shown a lack of physiological knowledge and acumen. Mr. Bates may be taken to have been a man who had an instinctive as well as an acquired conception of all those things, at least if we may believe what we have heard and read about him since his demise. He never, I understand, introduced his males and females hastily to each other, but while they ruminated in their folds or pastures, he ruminated from various standpoints about their features and idiosyncrasy, and their adaptability for each other. I do not know whether he took colour into account as one of the most potent integrals of the affinities, but there is no doubt but what he had an excellent taste for form, and also knew physiologically that all kinds of animals are desirous of finding their complement instead of their counterpart.

He held that all things are devised
To be by chemists synthesised;
That from each pair there thus may be a
Progenitor of some third idea;
That love from opposites is bred,
As white is born from green or red;
And that, like white, 'twould ne'er be seen
If green were bred with blue or green;
That 'tis from discords that we call
Our fullest harmonies of all.

Truly speaking, the rule of thumb practice of adjusting defective parts by introducing animals respectively unlike in those parts, has its roots in the affinities and the laws of natural selection. Probably much the same thing would happen if the beasts were running wild in the fields, and there was no human eye to control them. Because strong males have an affinity for weak females, and *vice versa*, but the strong males would kill the weak males off, and thus through all time preserve the vigour of the race. This is much what Mr. Bates has done only for a short space of time for Shorthorns. He studied Nature, and, as it were, usurped one of her destinies. We may presume that he understood a good deal about the laws of natural selection. If he did not, and was guided alone by a fine artistic eye, he arrived at the same result, but only in a different way. He produced strength and symmetry because, to speak phrenologically, he had the organs of individuality, form, and colour well set in his head. He also had love of animals in his heart, and many of the faculties which actuated a Potter or a Landseer to place those subjects on canvas. What Sir Edwin did by his brush Mr. Bates did through the living agencies of the animals themselves. Given a beautiful horse or a cow, Sir Edwin could place it on canvas in form and colour as he saw it, or improved if he liked. Given a selection of males and females, Mr. Bates could put them together so as to produce similar or improved forms in the progeny. This is the faculty required in a first-class breeder of Shorthorns, and therefore I cannot too strongly impress upon you the danger of practising such a difficult art, without being possessed of some of the special qualifications for it. Love of a particular breed of cattle by no means determines that you are fitted for the possession of it, and qualified to improve it if desired. Love springs from the heart, and may be affected by ungraceful forms as well as graceful ones. It requires something in addition. It requires the organs of form, individuality, colour, and comparison well developed in the cranium to enable a man to judge of Shorthorn cattle and carry the breed to a

successful termination. For example, there are many men who are able to tell which of two animals near a size is the heavier when standing closely together, but would be quite at a loss if they were separated a few hundreds of yards. These men would be found lacking the organs of individuality and comparison, and would also be apt to forget the faces and forms of men. I saw three recognised breeders of Shorthorns judging cattle quite lately down in the north, and they selected a bull with a neck scarcely if any improved from that of the bison, and every part of his body was an undulating surface of hills and holes. He had not even one foot of a straight line in his backbone. He was the heaviest animal and the ugliest, and therefore these men might be said to have an eye for weight and none for beauty. They could tell which was the biggest beast in the class, and that was about all. Another instance of the same kind came under my notice at one of our own Christmas shows—it was this: Two heifers of nearly equal age, same colour, and nearly the same weight, came out for adjudication. The one was rather bigger in size than the other, was made up of a number of straight lines and partially crooked ones, and upon the whole presenting a good many protruding points to the eye. The other had one straight line along the back, and the rest of the body was all over it and around it composed of the innumerable segments of a variety of circles, beautifully adjusted and harmoniously blended together. In short, a perfect specimen. They gave the prize to the former! This is another instance where the eye for weight was more correct than for beauty, and the judges would probably never have made good sculptors or painters, or landscape gardeners, if even they studied a very long time. With colour it is the same. Some men have eyes for colour, and none for form, and are always attracted by bright hues and smooth glossy surfaces. They also are not adapted for acting as breeders and judges of cattle, for while we do not ignore the value of good colours in the Shorthorn polity, we would not depreciate an animal in the scale of merit if its form was the best and it did not depart in any outrageous manner from white or red, or any mixture of those two. But colour in the showyard and in the breeding shed, are two different things to be studied. While form is the object to be attained in the arena of competition, I should place a very great reliance upon colour (and that not of the hair alone), as a guide to the proper admixture of blood in the home curtain. Colour, as we know, in all animals takes its hue from the secretions. It permeates the liver and the heart, and men have been known to go half distracted about a woman with a single shade of greater darkness in the eyebrows or eyelashes than her fairer sister had. It is so, in a modified sense, with the lower animals, and instances could be cited where males had taken a perfect dislike to females of a certain colour, because it was not in consonance with their instincts of sweetness and fitness. The moral of all this is that the breeding of Shorthorn cattle is a very insecure business, and that there are very few men in the universe capable of carrying it out to successful commercial issue—and hence the reason why a couple of herds have gained all the praise. They were superintended by men of extraordinary ability for a large number of years, and were thoroughly established—or, to use the artistic phrase, were well set in their frames. I venture to say that the possession of a head of fine fashionable Shorthorn is not a matter for much congratulation at the present time, if taken as a test of ability and sober judgment. As a proof of wealth it most assuredly is, but the credit and the fame all redound to Messrs. Bates and Booth, none of the gentlemen who ever followed in their footsteps having produced better animals than they did themselves. To originate a good herd from an obscure branch would be a matter of greater significance than the expenditure of 1,785 guineas for a fifteen months heifer by Sir Curtis Lampton, of 1,700 for a broken-down dam by Mr. McLutosh, of 1,220 for a small Lucy by Mr. Larking, of 555 for a ten months calf by Sir William Armstrong, or of £20 for an old cow by Sir John Swinburne or Sir Wilfrid Lawson. These cattle will die out, and the gentlemen who possess them will probably not be found to have produced anything in size and contour equal to the sires and dams they began with. And hence an extraordinary loss of time and money, for, as Mr. W. H. Sotham says in *The Mark Lane Express*, "The points of an animal must sustain the pedigree, otherwise pedigree is no use," and therefore the man who produces perfection of form from ordinary priced beasts is much greater and more to be commended than the

one who goes to the fancy sales and throws his money as it were into the ocean, to be swallowed up and wasted. It is not difficult, in my opinion, to produce the finest of Shorthorns without a fabulous expenditure of wealth. The economics of animal ordinance are with you. They are always striving with themselves to adopt the purely cylindrical shape, and that is the shape which all the best Shorthorns wear. The tendency of all the animal organisers, if placed in any kind of fair circumstances, is to advance instead of to decline upon the scale of beauty and vigour. Hence as you have Nature on your side the only difficulty you have to deal with is how to get fairly formed dams and sires to begin with. These you will soon find if you have an eye for beauty and proportion. The crossing of the sexes will belong to your ideas of blood, colour, and constitution, and if these are correct a herd will soon be produced equal to any of those of the Duke of Devonshire, Lord Bective, Mr. Cheney, or others we may have to mention. Indeed, I have no doubt but there are more within a very short distance at the present moment who with leisure on hand and suitable pasturage could produce in seven crosses from West Highland Kyloes, or polled Galloway dams, as good a herd as could be found in Great Britain. I will go further than that, and say that with two Shorthorn bulls at £100 each, and 20 Shorthorn cows at £10 each—their own crossing—they would be able to distance in three crosses two-thirds of the men who are plunging into such marvellously high-priced beasts, always recollecting that form, weight, and quality would have to be the deciding points. The Argyleshire Kyloe and the Gallowayshire polled Scot are as nearly perfect in formation as possible; therefore, if you began with them as dams you have only the colour, touch, and horn to correct, but I decidedly prefer the good country cow. To show how soon colour is dissipated by males of the Bos genus, I may mention a fact which is not perhaps generally known in reference to the wonderful power the black-polled Galloway male exercises over Ayrshire females in the very first instance. If he is a pure-bred animal he at once stamps his colour, his general lineaments, and his size upon the produce, and if he were put along with as many as one hundred Ayrshire cows, which, you will remember, would be nearly all red-and-white, possessing long horns, there would not be a single calf otherwise than jet black and without horns in the whole of the resultants. Each and every calf would undoubtedly be so much like the pure Galloway that a great many very good judges would not be able to detect the alloy. In crossing the Shorthorn male with Highland or Gallowayshire dams, the change is not so rapid, the cardinal colour, black, being more potent and enduring than the transitory reds and mixed shades of Shorthorn. It therefore does not go out at once, and the horn in the produce is a little elongated, as we see it in many of the Bates' tribes now—simply because an essentially long-horned breed and a short-horned breed were introduced together. This, I think, is detrimental to the pure Bates in an historical point of view as the appellation, "Short-horn" does not literally apply. However, as he is justly credited with having produced the originals of the highest-priced animals in the world, perhaps we ought to look back at this juncture, and see where he procured his first stocks, and also note a few of the wonderful gradations they have gone through up to the present time. Mr. Bates was contemporary with Charles Colling in 1800, but he was not in the ascendant as a breeder of Shorthorns, and his most memorable purchase was that of Young Duchess, for 183 gs., at Mr. Colling's sale in that year. It is said she was a descendant of the Kyloe, but the pedigree we have of her at that time is this—that she was a daughter of Comet, sold at the same time to four gentlemen for 1,000 gs., that her dam was from the not famous and almost universal bull Favourite, and that she was in calf to a son of Comet. Here then was the beginning of cross in-and-in, or consanguineous breeding at once. Since that time the breed has run through many generations with varied success, until last year at New York Mills, the fame of the "Duchesses" culminated in 40,600 and 35,000 dollars respectively being given for 8th and 10th Duchesses of Geneva. They were bought to come to England, and at the same sale nine other Duchess cows were sold at such high prices that the whole eleven came to £49,750, or an average of £4,522 11s. each. The great sales we have had since then in this country are Lord Danmore's, held last year, the Duke of Devonshire's, Lord Bective's, Mr. Cheney's, and Mr. Leny's this year, but none of the prices here have been anything like those obtained

at New York Mills. The highest price given was 2,000 gs. for a small heifer to Mr. Leny, while an Oxford bull of high fame was bought by Mr. Peter for the Duke of Roxburgh for 250. The average of the Duke of Devonshire's cows was 462 gs., that of Lord Bective's 382, and that of Mr. Cheney's 564; the commoner in this instance beating both the lords. The buyers of the highest-priced beasts have, no doubt, adopted the royal road to a herd of fine Shorthorns, but I shall be much surprised if they do not ultimately find out that there is no royal way of keeping it. Gentlemen like Sir John Swinburne may ultimately ascertain that a bull of the first water is almost as difficult to find, and to set in golden framework, as even a Cape diamond, and Sir Wilfrid Lawson that the aristocracy of the living race will require something better than the poor grass and cold springs of Brayton Park to keep them up. The present mania for high-bred cattle can therefore only be called a species of gambling of the most dangerous class. That for the turf does not seem to bear any comparison with it, for although you may lose sight of a couple of thousand guineas in buying a Stockwell or Newminster colt, yet it is quite possible that he may win the whole of it back for you in his first race. "True," it may be observed by some captious critic, "but you are quoting two strains of blood of the very first kind; what becomes of the second and third kind?" The second and third have also a much better chance of recouping the speculator than cattle, simply because they are handicapped according to their known capabilities, and often win races from very superior animals. While they are very much easier reproduced or propagated than Shorthorns, speed being the only desideratum, it matters little whether you have an eye for magnificence of outline and physique or not, you can always send your dams to reputable sires. With Shorthorns you have to wait nine months for a calf, and if that proves an abortion, as it often does in the hands of a novice, where are all the hundreds of pounds you have sunk in the originals? I trust I have made out pretty clearly that the faculties of the mind required to conduct a famous herd of Shorthorns through several generations with commercial success are of a much higher order than what they have generally gained credit for; that it takes a fine man to manage a fine herd well—a man steady and industrious in his habits, with the organs of perception and reflection well developed in his head—in reality an artist and a physiologist, fond of his art and his calling, and ardent in his desires to carry them out to a successful and a happy issue.

The CHAIRMAN agreed that a man should have a speciality for Shorthorn breeding to succeed, and instanced Mr. Outwaite, of that neighbourhood, as a proof that others need not be disheartened in making the attempt. Mr. Hedley had mentioned the advantage of study, and he (the speaker) thought the great point was to be careful as to their choice of a male, which had far more influence on the future than the female, and this applied to both cattle and horses.

Mr. NESHAM said there were three things required for Shorthorn breeding, and these were absolutely necessary—viz., a long purse, a very good eye for judgment, and very good land on which to bring up the animals. He showed the fallacy of the principle of breeding from an animal which was at all faulty in its own breed. As to Mr. Bates and Mr. Booth, if ever they met with an animal they did not like they put it out of the way, and as a consequence had a long range of steers in their breed. This might be an expensive way of doing things, but it must be done if perfection was to be arrived at. He had always had a great regard for Shorthorns, and had known them nearly all his life; his opinion was that there were better Shorthorns in by-gone days than were to be seen now. The great animals that were sold at the Duke of Devonshire's sale the other day were weedy, and would not compare with the animals which were seen forty years ago. Whether the system of in-and-in breeding had anything to do with it, was a question which he would not enter upon, and as to the prices, perhaps they, in a great measure, were due to certain noblemen who would have those animals, no matter at what cost.

Dr. BRUNNELL expressed his admiration he had of fine, large, well-coloured animals.

Mr. BYERS rather felt inclined to doubt if the £100 bulls and cows referred to in the paper would be successful in Shorthorn breeding. He showed that Mr. Bates tried to rival Mr. Colling, by breeding with Wildeyes, but he did not succeed, and he expressed his opinion that ordinary mortals could

hardly be successful with the animals mentioned by Mr. Hedley.

Mr. BELL said in that neighbourhood the farmers generally aimed at breeding animals that would pay as they went on. They had some pretty fair beasts, but not the sort referred to by Mr. Hedley. No particular breed was established in the locality, for the general aim seemed to be the production of good large steers and heifers. As to improving the breeds, all that they could do was to look at the females, and, having seen the deficiencies, try to find a male which was superior in those particular points. However, it was a noticeable fact that an animal of better breed always took well in the sale market, and they always paid better, for they fattened at a less expense. He testified to the improvements brought about by the introduction of Shorthorn cattle.

Mr. HAWDON thought that a persistent breeding in one class might lead to the effect of making the offspring more delicate.

Mr. GRAHAM (the secretary) testified to the difficulty of mating Shorthorn cattle, and in answer to the statement in the paper with regard to the high prices obtained at New York Mills, said he believed the large amounts were given by

a man that did not know the value of the money mentioned. He understood that he did not know the value of a dollar. He believed that a great deal was owing to those monied men who, in having a fancy for cattle breeding, brought Shorthorns to such perfection. These gentlemen, in some instances, allowed their tenants to have these valuable animals at prices not at all extravagant, by which means they went all over the country, and great benefit resulted therefrom. There was one in the neighbourhood who did something of the kind, and they were all very much obliged to him.

Mr. HEDLEY, in reply, thought the subject of the evening should be well ventilated along the banks of the Tees, which he designated the home of the Shorthorn. He repeated that it was possible to get good ones, especially if a judicious visit were paid to a locality where Shorthorns were not studied or thought much of. It was quite possible to find first-class bulls and cows at about £100 and £40 respectively. He dared say the Bates breed had degenerated, for the simple reason that it required a Bates to look after it. He showed the necessity of education to be successful in breeding.

The usual votes of thanks were passed, and the meeting broke up.

LAYING DOWN LAND TO PASTURE.

At the monthly meeting of the Shropshire Chamber of Agriculture, held at Shrewsbury, Mr. George Cureton in the chair, the following questions were sent to the Shropshire Chamber of Agriculture by the Royal Agricultural Society of England, requesting replies thereto, which Mr. Henry Brown, of Preston, near, Wellington, kindly furnished.

1. What is the acreage of your farm?—99 acres.
2. Is it your own property, or do you rent it? If the latter, do you hold on lease, or from year to year? And have you Tenant-Right?—12 acres only my own; the remaining part rented from year to year to Tenant-Right.
3. What is the nature of the soil and subsoil?—Sand, gravel, peat, clay.
4. What is the average rainfall in your district?—Very light, I should think not more than 25 inches.
5. In what year did you begin to lay down land to permanent grass?—1854.
6. What were, at that time, the proportions of your farm in arable land?—66 acres. Permanent pasture 33 acres.
7. What breadth of arable land (if any) have you, since the above date, laid down as permanent grass?—The whole of my farm I have now under grass.
8. In changing your system of management, were you influenced by the high price of fat and lean stock, by the increased and increasing cost of agricultural labour, or by other, and what circumstances?—Purely by the increased cost and difficulty of agricultural labour upon a small farm.
9. Besides distance from the homestead, and water supply, what other conditions (as quality of soil, value, aspect, &c.) guided you in selecting your fields for permanent grass?—In the outset difficulty in working thin-skinned land with uncertainty of crops.
10. Having made choice of your ground, with what kind of cultivation and crops, say in the two preceding years, did you prepare the soil for the reception of the permanent seeds? (If you have tried different methods, kindly state which you have found to answer best, as this is very important).—Turnips followed with barley or oats. Both sown thin, say from 5 to 6 pecks per acre.
11. Does your experience teach you that land should or should not be made as dry (I mean by underground drainage) for grazing as for arable purposes?—Decidedly not so dry, particularly open subsoils.
12. Your land being ready for seeding, in what month have you generally sown the permanent grasses and clovers? did you sow the light and heavy seeds separately? and what mixtures have you used with most success?—In April the light and heavy seeds generally sown together. The mixture of grass seeds I have not found of so much consequence as a high condition of land. I have always tried to get my land in a high state of cultivation before laying it down to grass; and not only so, but have found it even profitable to dose it well every year for the first four or five years, which com-

pels nature as it were to produce grasses that are indigenous to the soil. In this consists the secret of the whole business.

13. Do you recommend that the permanent seeds be sown with or without a grain crop which shall be allowed to ripen? with or without a sprinkling of rye, or rape, or some similar crop, to be eaten green?—With a grain crop allowed to ripen, sown thin, thereby lessening the probability of it lodging.

14. In laying down land to grass, have you practised the system generally known as 'inoculation'? If so, please describe the process adopted, and state the cost?—No.

15. What have you found to be the best mode of treating (including manuring) the young seeds, say during the first two or three seasons? Would you mow in any year? or would you depasture with cattle or sheep.—Always one or two dressings of well made farm-yard manure. I should prefer depasturing with cattle, but in a great measure should be guided by seasons. If a moist season I should prefer depasturing with sheep, or even to mow; but if the latter, a most liberal dressing with manure will be required. I think it of the utmost importance to avoid as much as possible treading and poaching of the surface for the first two or three years.

16. Have you found that this altered mode of farming pays you better than your former practice? and can you give in figures a tabulated comparison of the two systems, including the saving in manual labour and horse-keep?—Having only just finished putting the whole of my farm under grass I cannot answer the question as to pay, but so far as I can at present judge the result will be satisfactory.

17. What alteration (if any) in the number of breeding store, and feeding animals kept on the farm has been the result of laying down this land to permanent grass?—Two thirds more cattle; principally feeding.

18. Do you find that the number of stock kept on the farm is being increased or diminished as the recently laid down grass acquires greater maturity?—Much increased. For reasons given in the latter part of answers to question twelve.

19. What aid (if any) have you received from your landlord (if you have one) in laying down your permanent pasture? and what conditions (if any) accompanied that aid?—None.

20. Judging from the results of your own experience, what description and quality of land do you consider pays best to lay down to grass in your district? and what soils would you prefer to keep under arable cultivation?—Clays. The more open soils for arable culture.

The Improvement of Permanent Grass.—1. What means have you adopted to improve the already permanent grass existing on your farm, but not laid down by you, viz., by the application of manures, or the consumption of roots or artificial food on the land?—I have given heavy dressings with prepared bone manures and farmyard manure, and also a

liberal consumption of linseed corn and decorticated cotton cake.

2. What effect has the application of farmyard manure (if any) to your grass land on the system as manuring your arable land?—Greater outlay in artificial manures.

3. Do you mow any portion of your grass land in any year; and, if so, how often, or do you entirely depasture, and, if so, with cattle or sheep?—A small extent of peat grass land mow each year, the remainder entirely depastured with cattle.

4. Have you found that to improve your grass land makes

it pay you better than before? and can you give in figures a tabulated comparison of the two systems?—My first application of prepared bones gave an increase of 27 per cent in butter. I was then dairying.

5. What alteration, if any, in the number of stock kept on the farm has been the result of this improvement of your grass land?—I kept 25 head of cattle when my farm was one-third under grass. I have already reached 70, and confidently expect to increase to 90.

MORAYSHIRE FARMERS' CLUB.

THE TURNIP CROP.

At the quarterly meeting at Elgin, Lord Macduff, M.P., in the chair, it was agreed that there should be no show of seeds and roots in February.

The following subject was put down for discussion: "In the preparation of land for the turnip crop, whether it is more profitable to apply farmyard manure in the autumn or at the time of sowing?"

Mr. YOOL (Coulard Bank) said the question set down for discussion is no doubt one of considerable importance; but it is also one on which there is a considerable amount of conflicting evidence. Although I have carried out the practice of autumn manuring to some extent myself, I have never made any careful experiments to determine the relative advantages of applying farmyard manure to land intended for a turnip crop in the autumn or at the time of sowing. Any remarks that I may make on the subject, therefore, are merely the impressions derived from experiments recorded by others and what I have observed in my own experience. In the first place, then, I think, if land for turnips is to be manured in autumn, it must be thoroughly clean, and besides, be land of good quality and in good condition. If such conditions exist, then, I think autumn dunging may be practised with safety and profit, more especially if artificial manure is applied at the time of sowing (which is now almost universally the case), as it will serve to force on the young plants until their rootlets push out into the soil with which the farmyard manure is incorporated. Dunging in autumn will lessen the expense of application, besides considerably forwarding spring work, while, under the conditions I have referred to, and especially for Swedish turnips, which are abundantly supplied with roots, the crop will, I think, be as good, if not better, than when dunged at the time of sowing. If land is foul, autumn manuring will only stimulate the growth of weeds, and in such a case, I would prefer to leave off the dunging until the land was got cleaned in spring. On poor, hungry land, and on land out of condition, I think it is best to apply the farmyard manure in the drills at the time of sowing, as in such a case it is desirable to have the greatest available amount of manure close to the roots of the growing plants. On the light sandy lands of which so much of this county is composed, I should doubt the advisability of autumn manuring for the turnip crop. Such soils are of an open, porous nature, and are deficient in that mechanical texture which enables heavier soils, such as good loams and clays, to retain in a state of what Liebig calls "physical combination," the valuable manurial elements of the dung; consequently, on such thin, light soils, I think it is better to apply the manure in the drills at the time of sowing. It is an important question, and I think this Club might very judiciously devote a portion of its funds as a prize for a report on this subject. Experiments in agriculture are so very liable to be affected by differences in soil, climate, &c., that what may be a perfectly safe guide in one district may not be so in another; and as, so far as I know, no carefully-conducted experiments have ever been carried out in this county to determine the point whether, "in the preparation of the land for turnip crop, it is more profitable to apply farmyard manure in the autumn, or at the time of sowing," I think this Club might wisely devote a portion of its funds for an approved report on such a set of experiments.

Mr. ADAM (Hillhead): I have no experience with regard to laying down manure in autumn for the turnip crop. But about four years ago I had a piece of ground which was pretty much braeset, and I thought it could hardly be dealt with in the usual way, and so I laid down the manure in autumn. I found

that, although the turnips in that case were not so regular to a size as when sown in the drill, the crop was quite as heavy. I think if it were done upon land such as I operated upon in the autumn, it would be quite as successful as if done in the drill.

Mr. COOPER (Spynie): I have no experience. I intend to try an experiment on a piece of clean land this season. The great merit of turnip culture on light land is deep stirring; and, although it is apart from the subject, I would recommend that it be done by the steam plough. I have grown a good crop this year on light land by deep stirring. In general I think laying down manure in autumn does not suit in Morayshire, because there is such a tendency to run to weed by dunging the stubble. I think the difficulty would be in having the stubble land cleaned in time.

Mr. WALKER (Altyre): The question is one upon which five out of every six of the members of this Club could not give an opinion. We have never had an opportunity of testing the merits of autumn manuring as compared with summer manuring. A large portion of our farmyard manure is applied to the barley break, and to wheat in the autumn, so that in the autumn when you want to apply it to the turnip break, you have not the manure ready to apply to the land. There is no doubt about this, that now-a-days when horses and labour are such important matters in our management, if we had the dung to apply in autumn we would save a considerable deal of labour. We could save the trouble of twice lifting; and we would save the life of many of our horses, which are worked to pieces by being taken to the top of the dung-hill. These are conclusions which one can arrive at without much practical experience, but whether it would benefit the crop or not I cannot say. Mr. Yool has said that it would be well to spend some of the Club's funds on experiments. But experiments are so doubtful that one year they teach one thing and another year they teach something different, and we can have no confidence in them. For many years I was under the impression that autumn manuring of potatoes brought a better crop, and even saved from disease. Last year I manured in the autumn, and I have had more disease than any of my neighbours by a long way. So far as the question on the card is concerned, I have no experience, and can give no opinion.

Mr. RUXTON (Inchbroom): I have no experience, but my idea is that the sooner that the land is manured the better does the crop get on. I have a fear, however, that putting in a quantity of manure in autumn, much of its value will be spent during the winter.

Mr. HUNTER (Dipple): I have had no experience of manuring in autumn myself, but I may mention a fact which I noticed the other day. A competition for turnips was carried out by this Club in 1854, in which Mr. Lawson was successful; and I notice that in that year there was an experiment at Dipple, under which part of the turnip break was manured in autumn, and the other part in spring in drills. It turned out that the part of the field dunged in the autumn was lighter by one ton per acre than that dunged in the spring.

Mr. TODD (Ardivot): I think, taking into account the nature of the climate and soil, there can be little doubt that the best thing is to put the manure into the drill. I think Mr. Walker has mentioned a very practical point in referring to the fact that in nine cases out of ten the farmers have no manure at all to plough into the land in the fall of the year. But, independently of that, it is better for bringing the turnip crop to put it in the drill. But if you take potatoes, the very

opposite is the case. I would approve of putting the manure down for potatoes in the fall of the year.

Mr. MUNRO (Covelea): I would just in my very first remarks say that we never should have our land in a state but what it would be always fit for taking in manure. I never manure in the end of the year. The remarks by Mr. Walker concur with my own experience, that where horses are saved, and labour is saved, it is a very great matter indeed. I have found that after putting in dung with barley, I have had a good crop of turnips without farmyard manure, from very good bones and other stuffs I have bought from parties. I have found in my own experience that by applying farmyard manure when I was sowing my barley, that my barley crop was inferior to that on the portion of the land that was manured along with the turnips. I have no experience to give a decided opinion upon. However, I think if we could make more manure, and put it on twice, there would be no loss.

Mr. GREGOR (Western Aines): I have no experience of autumn manuring. I have always put the farmyard manure into drills. I was obliged to give 25 tons of farm manure, and may be 10 tons of manure besides.

Mr. LAWSON (Braelossie): I have had no experience of manuring land for turnips in autumn; but, I think unless the land be very clean (although Bailie Munro says it is possible for every man to have his land clean), it is impossible, in Morayshire, to lay down manure profitably in autumn; because, after the crop of wheat, you have lots of weeds to take out. I think, turning it over and over again in the autumn, would lead to a good deal of evaporation of the manure. My experience is to put the dung down in the drill, with a little artificial manure above it.

Mr. REID (Mains of Orton) concurred in the remarks by Mr. Walker.

Mr. GARDEN (Grangegreen) had no experience. The little he did in the way of manuring turnips he did in spring.

Mr. ADAM (Sweetthillock): There is no better way of putting it in than along with the drills in spring, because there is a great proportion of it, after the turnip crop, to benefit the succeeding barley crop.

Mr. ROSS (Hillhead): We have not all our fields like gardens, as Bailie Munro seems to say they should be. I think the land would be better to be turned up in autumn, to get much of the frost in winter, and have it ready in spring. It would best suit the soil and climate of Morayshire to do so, and apply the manure in spring. Instead of the experiments proposed by Mr. Yool, I would give a prize for the best field of turnips, for which the manure was laid down either in autumn or spring.

Mr. CULHARD (Elgin): I am only a crofter, not a farmer, but I have observed this, that in taking up my crop of turnips, and seeing the land tilled, I saw much of the manure untouched. (A voice: You have given far too much.) Possibly, but I have often seen gardeners in order to get a good crop, put the land under a heavy manuring the year before they wanted to raise a good crop. So, I think if you had the manure, as sometimes you have not, in the autumn, it would be fully better to put it into the soil a few months before the seed.

Mr. YOOL: Lord Macduff has allowed me a remark in reply. I expected that very little exact information would be brought out. It was simply because I thought that no very exact conclusions would be arrived at that I proposed that this Club should devote a small portion of its funds to the purpose of elucidating this question. We all know that without experiment there can be no progress, and I think the Club in directing such an experiment would be in the way of its duty.

Provost CAMERON: Supposing you give some of the money that you will save by not holding your Spring Show.

Viscount MACDUFF: The majority have given their opinion in favour of laying down manure in spring, and not in autumn, as being best suited for the nature of the soil and climate of this county. I propose that Mr. Yool's recommendation be sent to the Standing Committee of the Club for consideration.

The motion was agreed to.

A COSTLY BIRD.—At an adjourned Justice of Peace Court held in Stonehaven, William Kirkland, a young lad, was charged with day trespass in pursuit of game on the farm of Currans, parish of Strachan. He pleaded guilty to taking a muirfowl out of a snare on a stock of corn, and was sentenced to pay the mitigated penalty of 2s. 6d., with £5 6s. 11d. of expenses, or go to prison for twenty days.

REVIEW OF THE CATTLE TRADE DURING THE PAST MONTH.

On the whole the cattle trade has been quiet in tone during the month. Compared with the corresponding month last year, the total supplies of beasts exhibited have been larger, owing to the liberal receipts from abroad. From our own grazing districts the arrivals have been less numerous than during that period; but from Scotland they have been better. There has been, as usual, a marked disparity in the condition of the stock exhibited. For the best kinds the demand has not been active, and the top quotation has been 6s. 2d. per 8lbs. For medium qualities, especially during the cold weather, more inquiry has prevailed, and quotations for such descriptions have been relatively higher. From abroad supplies have been more extensive, the imports from Tunning being exceptionally heavy. The demand has been without feature at about the rates previously current.

In the sheep market nothing of interest has transpired. The supplies exhibited have been good, owing to the heavy importation—nearly 45,000 from abroad. The condition of our home-bred stock has been in the main satisfactory, and the improvement in the quality of foreign breeds continues to make progress. Business has not been brisk, but a fair amount of steadiness has prevailed, and 6s. 2d. per 8lb. has been paid for the best Downs and half-breeds.

The calf market has been alternately steady and depressed; but the closing prices of the month are not the highest. Supplies have been moderate.

Pigs have been quiet and unaltered.

The total imports of foreign stock into London last month have been as under:

Beasts	14,155
Sheep	44,843
Calves	1,247
Pigs	1,324

COMPARISON OF IMPORTS.

Nov.	Beasts.	Sheep.	Calves.	Pigs.
1873	9,472	34,733	1,924	2,563
1872	4,226	35,113	2,289	204
1871	12,846	56,299	1,857	2,812
1870	14,903	43,830	2,177	2,463
1869	9,964	32,091	1,713	2,208
1868	9,391	18,162	598	353
1867	10,761	23,202	618	2,069
1866	13,278	38,359	1,290	1,187
1865	16,254	52,517	2,626	7,770
1864	17,137	34,792	2,970	3,947
1863	11,020	30,447	1,770	2,202
1862	6,839	28,577	1,659	633
1861	5,295	27,833	946	1,241
1860	6,961	22,723	1,604	828
1859	5,927	21,907	997	15
1858	4,786	18,258	1,174	15

The arrivals of beasts from our own grazing districts, as well as from Scotland and Ireland, thus compare with the three previous years:

	Nov. 1871.	Nov. 1872.	Nov. 1873.	Nov. 1874.
From Lincolnshire, Leicestershire, and Northamptonshire	9,150	8,750	8,965	7,820
Other parts of England, including Norfolk and Suffolk	2,100	3,430	2,580	2,050
Scotland	79	240	125	858
Ireland	600	3,730	2,000	1,543

The annexed figures show the total supplies of stock exhibited and disposed of at the Metropolitan Cattle Market during the month:—

Beasts	24,700
Sheep	94,870
Calves	2,040
Pigs	250

COMPARISON OF SUPPLIES.				
Nov.	Beasts.	Sheep.	Calves.	Pigs.
1873	22,970	85,300	2,105	560
1872	18,620	77,590	1,995	856
1871	25,100	108,930	2,017	720
1870	15,570	96,920	2,232	1,670
1869	21,390	77,990	1,604	615
1868	19,249	98,390	1,048	1,404
1867	24,080	109,960	1,016	2,350
1866	21,660	95,800	1,190	3,090
1865	36,820	167,230	2,558	2,811
1864	32,600	114,300	2,587	2,900
1863	27,704	99,130	2,156	3,170
1862	30,129	110,020	2,313	3,172
1861	26,590	109,370	1,370	3,430
1860	25,400	103,600	2,112	2,920
1859	26,492	120,840	1,299	2,890
1858	24,856	114,643	1,437	2,970

Beasts have sold at from 4s. to 6s. 2d., sheep at 4s. 4d. to 6s. 4d., calves 4s. 8d. to 5s. 10d., and pigs 4s. to 5s. per 8 lbs. sinking the offal.

REVIEW OF THE CORN TRADE DURING THE PAST MONTH.

The weather of November has exhibited strange fluctuations. It commenced with a vernal growth upon all vegetation, and a warmth approaching summer-heat; then came a few days of autumnal severity; and just as we seemed likely to have a green Christmas we had a sharp taste of frost, broken shortly again by mildness, and then returning with increased severity, and leading to the conclusion that a hard season was coming on. There being no reliable forecast to help us through the difficulty, we must content ourselves with Nature's favours, whatever they may be. The meadows, however, can no longer be a resource for the cattle, so that feeding-stuffs, with a short crop, must keep up in price; but the forward wheat, which was becoming winter-prond, will have a salutary check. The land, as a whole, yet keeps dry, though lately some fine rains have fallen, and this complaint comes more decidedly from every part of Europe, our insular position keeping us better supplied. The potato-pits will now be tested as to the soundness of quality; but with a good yield of this tuber we can bear some loss. The wheat trade since harvest has been very much shaken as to values, and the frost may have brought us past the lowest point; for 43s. 9d. per qr., the last general average, was quite low enough, and we take it, that the fact that the last crop has certainly been better than several of its predecessors has led to exaggerated views of its abundance, and set up a sort of senseless panic; but the gradual falling off in the weekly sales shows that farmers have not yet quite lost their spirits, but look out for better days, as in times past; and when Christmas rents are paid, we may see a more decided turn. The only gain of the month has been 1s. per qr., but a pinch of snuff will not pass for a substantial meal. So at least men on strike have found it, and it may strike farmers who can hold that it is better to do so than cut themselves to the quick. In this respect foreign growers and holders are quite of their mind. France is 1s. to 2s. dearer. Productive Hungary shuts up her stores rather than make sacrifices. Egypt has become tired of sending to no profit. Morocco is forbidden by the Emperor to make shipments. If the devastation of the Civil War in Spain increase, we may find that country an importer. Every port in the Baltic and Black Sea looks for better times; and though we may now and then have a mad-eap advocate of the consumer, who likes to walk in stilts and pass for an oracle, generous enough to feed the people at the farmer's expense, we hold to the maxim, set every man be fairly remunerated for his toil. The following prices were recently quoted at the several places named:

Best white wheat at Paris 47s. 6d., red 46s.; at Bordeaux, white, 47s. 6d.; at Marseilles, Berdianski 45s. 8d., Ghirka 42s. 10d., white Spanish 43s. 6d.; Courtrai, in Belgium, 46s., at Louvain 48s., at Liege 47s., at Amsterdam 45s., Maestrecht 45s., fine red at Hambro' 46s., white Rostock 48s. 6d., best high-mixed at Danzig 45s., fine red at Mayence 45s., at Cologne 41s., at Berlin 40s., at Buda-Pesth 45s.; Sandomirka at Odessa 40s., Ghirka 33s.; prime white at San Francisco 45s. 6d. per 500lbs. c. f. i.; red spring at New York, 36s. 4d. per 450lbs. f. o. b.; soft wheat at Algiers, 46s., hard 45s. per qr. f. o. b.

The first Monday in Mark-lane opened on a moderate supply of home-grown wheat; and the foreign arrivals were much reduced, though quite adequate to the demand. The show of fresh samples on the Essex and Kentish stands was limited, with the condition somewhat deteriorated by the damp weather. Dry parcels were slowly taken at the previous rates, but all inferior were very difficult to place. The foreign trade, notwithstanding the short supply, was very dull, new red American and Ghirka qualities being rather cheaper ex ship. The arrivals of floating cargoes were limited, and quotations barely maintained. The country trade this week was answerable to that of the Metropolis, and rather worse: many places gave way 1s., as Gainsborough, Leeds, Melton Mowbray, Newbury, Sleaford, Spilsby, &c., while at St. Ives and Sheffield there was a decline of 1s. to 2s. per qr., as well as at a few other places; but Liverpool was steady through the week. At Leith the wheat trade was 6d. dearer, and Ghirka sorts were 1s. higher; but at Edinburgh there was no change, while Dublin was dull for native qualities. Foreign obtained about 6d. per barrel more money.

On the second Monday the English supply was rather diminished, but the foreign was more than doubled, consisting principally of Russian and American red, with a fair sprinkling, including white, from other parts. The exhibition of fresh native samples this morning was limited, but in rather improved condition. Sales, however, were but slow, at unaltered prices. White samples of foreign, being comparatively scarce, were fully as dear, and, in some instances, brought rather more money; but low red sorts were but a heavy sale, and sales ex ship rather lower. Though the arrivals of floating cargoes were limited, the demand was slack at previous quotations. The country trade this week, without positively reporting any decline, remained dull. Liverpool on Tuesday was 1d. per cental dearer for white qualities, and Friday's market showed some improvement in red.

As the week wore on, a sharp change in the weather to severe cold took place; and as a consequence, several of Saturday's markets were up 1s. to 2s. But at Edinburgh there was a decline of 1s. in wheat, and Glasgow remained with but a qu'et trade. This week Dublin somewhat recovered, the market showing a more active inquiry for both native and foreign samples.

On the third Monday the English supply was lessened, as well as the foreign arrivals, though the latter were still good, and half of them from New York, the rest being from Russia and the Baltic. The number of English samples this morning was below an average, and, through the frost, were much improved in condition. Backed by the rise of Saturday, in the country holders demanded more money, and were able to place their best samples at 1s. advance, but could get nothing over previous rates for inferior sorts. The change in foreign was more decided, and 1s. was made all round for samples, both red and white; but with signs of a return to mild weather, the market towards the close lost some of its animation. Floating cargoes were generally held for more money, and on Ghirkas an improvement of fully 1s. was realised. Monday's advance in London was thoroughly welcomed in the country, and a similar rise of 1s. was noted at the following places—viz., Brigg, Birmingham, Hull, Ipswich, Louth, Market Rasen, Sleaford, Spilsby, Leeds, Manchester; while at Gainsboro', Barnsley, Melton Mowbray, Reading, Newbury, Salisbury, &c., the advance was 1s. to 2s. Liverpool on Tuesday was 1s. per cental dearer. On Friday the market was dull, but without change. Edinburgh and Leith were up 1s., and Glasgow 1s. to 1s. 6d. per qr. Native wheat was held for more money at Dublin, and foreign obtained 6d. per barrel advance, but closed heavily.

On the fourth Monday the English arrivals of wheat were short, and those from abroad large, more than half being Russian. The show of fresh samples on the Essex and Kentish stands was limited; and, with a change back to cold weather, factors early in the morning asked more money, but could not obtain it, millers being very careless buyers. In foreign also there was no change, excepting for New Zealand white, which, becoming scarce, obtained rather more money. The floating trade was unaltered.

The arrivals into London for four weeks were 21,892 qrs. English wheat, 102,479 qrs. foreign, against 18,307 qrs. English, 158,668 qrs. foreign, in 1873. The London exports were 4,696 qrs. The imports into the kingdom for four weeks ending Nov. 14 were 3,721,031 cwt. wheat, 492,368 cwt. flour, against 3,753,729 cwt. wheat, 354,306 cwt. flour in 1873. The London averages commenced at 47s. 5d., and closed at 44s. 8d.; the general averages opened at 44s. 1d., and ended with 43s. 9d.

The flour trade throughout the month has exhibited very little change excepting in the demand. The top price of town-made has stood at 43s. White Norfolks have been about 30s. to 31s., and American barrels 25s. to 26s.; while at Paris the best mark (D) was worth 36s. Extra state at New York has been 18s. 8d. to 19s. 5d. per barrel f.o.b. The country supplies have been good and regular; those from abroad were comparatively light. The London imports in four weeks were: in country sorts 81,624 sacks, in foreign 5,669 sacks 18,603 barrels, against 90,929 sacks country, 4,155 sacks 32,973 barrels foreign in 1873.

Of maize the supplies have been uncommonly small; but its high rates, as compared with barley, have very much limited the demand. Flat mixed American was worth 38s. 6d., and round brought as much as 39s. 6d.; this shows about 1s. 6d. per qr. advance. The four

weeks' London imports were 3,891 qrs., against 18,470 qrs. in 1873.

The barley trade has strengthened in tone, and gained 1s. 6d. both in malting sorts and the lower qualities. The English supplies have been only moderate; and, excepting the first week, the foreign arrivals have fallen off, and a demand has sprung up from America. The best malting has become worth 49s. and rather more, grinding 29s. to 34s.; while Saale at Hambro' has brought 50s., supplies being scanty, and fine Holstein 40s. It would seem that fine malting descriptions will maintain their price all through the season, supplies everywhere being limited. The best French at Paris were not worth over 35s.: their quality does not come up to last year's. The value of grinding sorts must be ruled by foreign arrivals, which, if the weather be mild in winter, we expect will be plentiful; but more so in spring. The four weeks' London supplies were 16,458 qrs. British, 41,667 qrs. foreign, against 20,103 qrs. British, 17,846 qrs. foreign, in 1873.

The malt trade throughout the month has been steady, and the value of fine sorts hardened at the close; the best new worth 72s. to 74s., fine old 2s. more.

From the first fortnight the foreign arrivals of Oats were small; and though increased on the third Monday, values during the three weeks were improved about 1s. per qr.

On the fourth Monday, though the imports were considerable, and fine sorts, from being only in a small proportion, were rather dearer, and even the lower sorts were firm from a large demand. With a return of colder weather and winter commencing, and the fact that everywhere this grain has shown a less abundant yield than usual, we cannot for some time look for low rates, as granary stocks are not heavy, and spring, whatever it may bring us, may be late. 40 lbs. sweet Russian sorts are worth 29s. 6d., 38 lbs. per bushel 27s., and lower sorts in proportion. For English extra prices are made, especially for heavy weights. The English supplies for four weeks were only 2,907 qrs., Scotch 277 qrs., Irish 222 qrs., foreign 157,849 qrs., against 5,215 qrs. English, 11,642 qrs. Scotch, 5,933 qrs. Irish, and 159,983 qrs. foreign in 1873.

Notwithstanding the high prices made, beans have been firm all through the month, the crop being short, and Egyptian supplies very scanty, though some have come from Algeria, Italy, and France. The want of maize, however, kept up the demand, and new Harrows are worth 46s. per qr., Mazagans 43s., and old small 54s.; Egyptians 43s. to 44s.; other foreign more in proportion to dryness and weight. None can now come from Morocco, as the Emperor has forbidden the exports. It is, therefore, not likely to be cheap this season. The imports into London for four weeks were 3,427 qrs. English, 8,713 qrs. foreign against 4,129 qrs. English, 4,325 qrs. foreign in 1873.

Peas, too, have been steady in price, the English supplies having been limited, and there has only been one considerable arrival of foreign, and those were white from Canada. These latter were held at 43s. to 44s. per qr., and hog-feeding sorts were about the same. Should the winter be sharp, there is plenty of room for an advance in boilers, but not for other kinds. The London imports were 3,442 qrs. English, 14,900 qrs. foreign, against 5,397 qrs. English, 684 qrs. foreign in 1873.

The luscied trade has not varied, but the demand has been limited, from the extreme fineness of the autumn. The imports were 10,523 qrs., against 28,405 qrs. last year.

Some little business has been passing in red cloverseed, but from an impression it will be dearer, holders have been asking too high rates to lead to large transactions. Some American is on its way worth about 47s. per cwt. In Paris the best red was quoted about 60s. per cwt. It is here worth 65s.; fine English from 80s. to 90s. per cwt.

BRYANT & MAY'S MATCHES.

LONDON AND COUNTY BANKING COMPANY.

ESTABLISHED 1836.

SUBSCRIBED CAPITAL...£3,000,000, in 60,000 SHARES of £50 EACH.
PAID-UP CAPITAL...£1,196,880; INSTALMENTS UNPAID, £3,120 (£1,200,000).
RESERVE FUND (paid up)...£598,440; INSTALMENTS UNPAID, £1,560 (£600,000).

ASSISTANT MANAGER—WILLIAM HOWARD, Esq.

THE LONDON AND COUNTY BANK opens—

DRAWING ACCOUNTS with Commercial Houses and Private Individuals, either upon the plan usually adopted by other Bankers, or by charging a small Commission to those persons to whom it may not be convenient to sustain an agreed Permanent Balance.

DEPOSIT ACCOUNTS.—Deposit Receipts are issued for sums of Money placed upon these Accounts, and Interest is allowed for such periods and at such rates as may be agreed upon, reference being had to the state of the Money Market.

CIRCULAR NOTES AND LETTERS OF CREDIT are issued, payable in the principal Cities and Towns of the Continent, in Australia, Canada, India, and China, the United States, and elsewhere.

The Agency of Foreign and Country Banks is undertaken.

The PURCHASE and SALE of Government and other Stocks, of English or Foreign Shares effected, and DIVIDENDS, ANNUITIES, &c., received for Customers of the Bank.

Great facilities are also afforded to the Customers of the Bank for the receipt of Money from the Towns where the Company has Branches.

The Officers of the Bank are bound not to disclose the transactions of any of its Customers.

By Order of the Directors,

WM. McKEWAN, } Joint General
WHITBREAD TOMSON, } Managers.
